the most successful milk substitute on the market—the standard of perfection. Thousands of farmers are using it and cannot say enough for it. It is NOT a stock food—it's a complete food that long experience has proved to be right for rearing calves. It contains all the nutrition of milk prepared in the most digestible form and is sold on a money back guarantee to give results.

100 lbs. equal to 100 gallons milk—Try it on your calves.

Great Western Mills, So. Calif. Distributors,
Dept. B, Deak B, Los Angeles, Cal.

that last week he shipped two bulls to Glenn county, one to Humboldt, and one to Tulare county.

Bishop Bros. of San Ramon report a 130 per cent lamb crop with their purebred Shropshires to date. Their lambing this season has been done at Midway, where conditions have been favorable. They expect to have about 600 rams for sale the 1917 season.

A Hereford organization is proposed for a meeting called by Charles Rule, H. H. Gable, and D. O. Lively at San Francisco May 2. Everybody in the Coast and neighboring States interested in Herefords is invited to attend, and go next morning to Mayfield where will be held the first public sale of registered Herefords ever undertaken in California.

J. M. Dunlap has returned from the East and brought with him four Hereford bulls for the Simon Newman Co. Three were Bonnie Braes from Wm. Andrews & Son of Iowa, who bred the bull Bonnie Brae, which sold twice for over \$10,000. Mr. Dunlap also brought one Short-horn bull for Benj. Rush, secured from John Cresswell, of Iowa, an exceptionally fine animal of Scotch topped Bates breeding. Mr. Dunlap also brought four yearling Scotch heifers of Duchess of Gloucester breeding, which he now has at the Roselawn Ranch near Woodland.

F. W. Harding, Sec'y of American Shorthorn Breeders' Ass'n, spent several days in California last week visiting the herds of W. M. Caruthers, Ormondale Farm, Palmdale Ranch, Chas. F. Hawkins, A. W. Foster, London Ranch, T. S. Glide, Roselawn Farms and others. He then left for the Northwest, on his way home. While here Mr. Harding announced that the California State Fair will have a \$3000 purse hung up for Shorthorn prizes, Los Angeles will have \$3000, Portland \$5000, also Fresno will have a liberal donation. The American Shorthorn Association is giving every encouragement to the purebred men on the Coast this year.

HORSES, JACKS, AND MULES.

A fire at Vladivostok, Siberia, destroyed 50,000 bales of cotton last week valued at \$10,000,000.

C. W. Bowers of Davis has shipped a carload of draft horses to Klamath Falls, Oregon.

A shipment of 10 registered Black Mammoth jacks has recently reached Tulare for disposal among farmer breeders.

California contractors are trying to get Colusa county mules at \$250 per head according to the Colusa Sun.

Many stockmen of Contra Costa county have turned their stock onto volunteer grain on account of short pastures.

Two carloads of mules from San Joaquin county and one from Solano have been shipped to Los Angeles for use of the U. S. army. They cost up to \$200 and were scarce at that.

The best equipped horse barn ever erected in California is being built by Easton and Ward on their newly acquired ranch near Danville, Contra Costa county, to house their purebred Shires. Twenty-two box-stalls all face a court, with feed overhead. They expect to move their horses from Burlingame about the last of May.

CALIFORNIA POLAND-CHINA BREEDERS' ASSOCIATION.

The officers of the newly-formed California Poland-China Breeders' Association are not going to be satisfied to follow in the footsteps of other breed organizations. They will strike out along new and original lines, and do things differently.

Among other things, they propose to encourage the Banker-Farmer and the Pig Club movements; to give the Poland-China hog publicity in our magazines and newspapers; to furnish speakers at conventions and gatherings; to hold consignment sales in different parts of the State; to encourage livestock exhibitions and interest breeders in showing; and last, but not least, to make every membership worth many times its cost by taking a deep, personal interest in the member, and giving him such hearty co-operation and support as to enable him to have, not merely ordinary success, but a bulging measure of prosperity.

Everyone in California who raises Poland-Chinas is urged to join the Association at once. The dues are but \$1 a year, and remittances should be made to R. H. Whitten, Secretary-Treasurer, 610 Security Bldg., Los Angeles.

Commencing April 1, Mr. Whitten plans to issue a monthly bulletin, giving the news in Poland-Chinadom, also practical suggestions and helpful information. This will be mailed free to all members.

The next meeting of the Association will be held at the University Farm, Davis, during Farmers' Week in May, the exact date to be announced later.

A consignment sale will be held at the State Fair in September, to which the breeders will consign some of their best animals and show

the people what real Poland-Chinas are. It will be the greatest sale of its kind ever held on the Coast.

HIGH RECORD HEALTHY HOLSTEINS

Of the right sort to strengthen your established herd or upon which to build a new herd, will be sold to the highest bidder on

THURSDAY, APRIL 19, 1917,

at H. E. Cornwell Ranch, two miles north of MODESTO, CALIF.,

when we will sell the entire herd, except a few heifer calves, owned by H. E. Cornwell.

38 Registered HOLSTEIN FEMALES & BULLS 6 Grade

JERSEY COWS AND HEIFERS

The registered Holsteins include: Cows with official records up to 26.50 pounds butter in 7 days.

Cows with semi-official records up to 707.31 pounds butter in one year.

Splendid heifers and cows with high official and semi-official records, bred to PRINCE HISKE WALKER, son of the famous Prince Gelsche Walker and out of Hiske of Riverside, 26.63 pounds butter in 7 days, 711.57 pounds butter in one year.

PRINCE HISKE WALKER HIMSELF WILL BE SOLD

and if you want a bull of real herd heading quality and breeding, figure on being the last bidder for him.

There will be also a choice offering of young sons of Prince Hiske Walker out of good dams. Everything tuberculin tested.

Catalog now ready. Write for one.

Sale under management of California Breeders' Sales and Pedigree Co.

C. L. Hughes, Sales Manager, Sacramento, California. Auctioneer, Col. Ben A. Rhoades, Los Angeles.

HOLSTEIN FOLKS: Plan to attend the meeting of California Holstein - Friesian Association, Hotel Hughson, Modesto, 8 p. m., Wednesday, April 18.

Hogs Grind Grain

SAVES GRAIN ALWAYS SANITARY

Received Highest Award Panama Pacific Exposition

The hogs grind their own grain, thus saving feed and labor. Mill will care for 30 hogs at full feed and is easily and quickly operated by hogs weighing 40 lbs. Grinds all kinds of grain, keeping clean, fresh and sanitary always. 60 Days' Trial Without Risk

We positively guarantee to refund all money and pay freight both ways if you are not absolutely satisfied at the end of 60 days' trial. Write today for free booklet and our 60-day Trial Without Risk Offer.

HOG MOTOR COMPANY 733 Andrus Bldg., Minneapolis, Minn.

Rosamond Farm Sale
Stalder Bros.,
Riverside, Cal.

On Tuesday, May 22, 1917,

We will sell a high class draft of registered

HOLSTEIN-FRIESIAN CATTLE, PERCHERON HORSES,

and about 20 head of high grade Holstein and Jersey heifers from the herds of Stalder Bros., ROSAMOND FARM, near Riverside, California.

Buyers of registered Holsteins have never before been offered such high record blood from one herd in California. Here are some of the 60 head to be sold:

A. R. O. COWS WITH RECORDS UP TO 28.07 POUNDS BUTTER IN 7 DAYS.

15 granddaughters of Prince Gelsche Walker and Aralia De Kol, former world's record cow.

20 cows and heifers in calf to a 34-pound grandson of King of the Pontiacs.

10 cows and heifers in calf to a 29-pound son of Prince Gelsche Walker.

A son of a 28.91-pound cow sired by a 29-pound son of Prince Gelsche Walker.

5 sons of a 34-pound sire and out of good dams.

Catalog now in preparation. Write for a copy.

Sale under management of CALIFORNIA BREEDERS' SALES AND PEDIGREE CO.

Auctioneer, Col. Ben A. Rhoades, Los Angeles. C. L. Hughes, Sales Mgr., Sacramento, Cal.

The West's Best JERSEYS

At Your Own Price

We are instructed by Mr. C. G. McFarland, owner of Willowwood Herd of registered Jerseys, Tulare, Cal., to sell the entire herd, numbering about 60 head, at public auction, absolutely without reserve or limit, on Thursday, May 17, 1917.

This herd contains some of the very greatest Register of Merit cows on the Pacific Coast, and all of them, together with their daughters, will be sold to the highest bidder.

There will be a splendid selection of young bulls, many out of dams with high Register of Merit records and by richly bred sires.

This is absolutely the best herd of registered Jerseys ever offered for sale in the State of California.

Catalog now in preparation. Write for one.

Prunes and Apricots Five Years Hence.

[Written for Pacific Rural Press.]

"Five years from now, I expect to see a prune crop of 300,000,000 to 400,000,000 pounds, owing to increased acreage in California," says General Manager H. G. Coykendall of the Cal. Prune and Apricot Growers, Inc. "The largest crop we've had was 210,000,000 pounds in 1912. Since then we've had short crops and high prices which have induced heavy planting. In Napa county the acreage has doubled. I expect Napa and Sonoma counties to produce greater tonnage five years from now than the Santa Clara Valley will have then, because they have so much more acreage available. The apricot tonnage of Santa Clara and counties farther south will be greatly increased.

"There will be better distribution throughout American cities due to advertising the merits of prunes and apricots and inducing more retailers to handle them on a smaller margin than they can now, because their trade will be so greatly increased.

Foreign markets will be exploited to the limit.

These fruits will be put out in new packages. Imperials will be sold as confectionery, to be eaten without cooking; but they will be handled more carefully than now. There will perhaps be a 2-cent differential for extra fancy apricots. All fruits will be paid for on the basis of quality.

Prune and apricot by-products, and new products, will be developed by careful experiments, and advertised to create a demand for them.

Crop reports that are reliable for all sections of the State will be

available for the growers. Their crops will not be sold until they show reasonable certainty of maturing.

Prices to growers will not be beaten down by speculation, for the gambling element will have been taken out. Prices to consumers will be based on the crop and the demand. Crops will be sold early in the season, perhaps in May, at prices not to be named until perhaps in September and probably guaranteed against decline until March in order to give confidence to Eastern buyers.

The goal of the Association is to eliminate the immense profits between producer and consumer. For the present there is no intention of trying to revolutionize the industry.

The Board of Directors, says Mr. Coykendall, are such men as would prevent the failure of any manager. The management is not a one-man proposition, but rests on a representative Board selected by the Growers' Trustees. Their policy is not fully shaped as yet, but it seems certain that affiliated packers will use their own brands and sell to their own customers; but all orders and payments will be made through the Association. There will be Association inspectors at all packing houses when the fruit comes in and when it goes out. The Ass'n will have full charge of all fruit which affiliated packers handle and will even attend to billing it out, etc. There will be immense prosperity.

If the organization fails May 1 for lack of support, these things will not come to pass.

Straw Mulch Improves Citrus Soil.

[Written for Pacific Rural Press.]

Adolph Butze improves the quality and size of his navel oranges and avoids the damage and cost of cultivation by mulching his orchard with grain straw bought cheap from neighboring farmers in Tulare county. The soil had become dead, hard, cloddy, cemented. Since the straw was put on, it has become mellow, soft, full of angleworms, and takes water well all summer.

"If I can't get all the straw I want within hauling distance, I will ship it in at a freight cost not to exceed \$15 per car," says Mr. Butze. "That's how much I think of it."

He hauled last year 90 loads of straw weighing over 2500 pounds per load, to 17 acres of eight-year trees. Twenty-five loads cost \$2 per load in the field as left by the combined harvester, and were

hauled 2½ miles. The rest was hauled seven miles, costing \$1 per load where threshed in settings. Labor and all cost \$375 last year.

Last summer, the straw was five or six inches deep in the orchard in July. This spring when the ground was plowed, the straw did not turn under very clean so only half as much will be used next grain harvest season.

Use of the mulch allows tree roots to come nearer the surface where most of the available plant food, air, and moisture are located. This makes the root pruning more severe when the orchard is plowed in spring; so it is not plowed deep, and the time may come, as it has in other mulched orchards, when no plowing will be done at all. Lime may be added to prevent souring.

Fighting the Cantaloupe Aphis.

[By Prof. C. W. Woodworth, University of California.]

When cantaloupe vines are first infested in spring the insect is limited to a very small number of vines upon which they become exceedingly abundant before developing wings and spreading generally over the field. When this is the case the practice of many growers is to sprinkle gasoline on each of these early infested vines and set fire to it, thus killing all the aphids as

well as the plant. This practice does not prevent the final general infestation of the field, but delays the time of infestation very appreciably. Where this aphid gives trouble, it would be well to adopt this method of controlling the insect, provided the winged spring migrants are as few as is the rule in the Imperial Valley. If the early infestation is general this is no good.

Olive Varieties to Plant this Season.

[Written for Pacific Rural Press.]

"Manzanillo olives were practically all picked in the San Joaquin Valley last season before the frosts came," says Pres't J. C. Martin Jr. of the California Associated Olive Growers, Inc. "The bulk of the Manzanillo crop of San Joaquin Valley was harvested a month before the bulk of the Missions," added Secretary R. L. Underhill of the Association. They were full ripe on R. Roberts' orchard at Madera Oct. 14. But in Butte county the difference seemed only two weeks according to these gentlemen, because the Missions here seem earlier than in the San Joaquin. It is fair to add that the frosts were earlier last year than in the previous five years—also the Missions seem to recover from ordinary frost where Manzanillos do not, as was seen in Sacramento county last season in many instances.

The earliness of Manzanillos is, however, leading many growers to plant at least 50 per cent of this variety, not only as a frost insurance but also to keep a smaller force of pickers busy through a longer season by picking Missions after Manzanillos.

Manzanillos must be picked a little less ripe than Missions, and must be handled with more care because the oil cells break down more easily and they are more subject to bruising. They have a little less oil, but are considered fully as good eating if properly processed.

Prof. F. T. Bioletti of the University of California notes that Manzanillos average slightly larger and more uniform and finds them as easy to process as Missions if not over-ripe. They hold their black color

better also, but he does not like their flavor quite so well. They should be picked just when they are turning black.

Ascolanos are the most promising variety, according to the Professor. They are larger and better flavored than Manzanillos and process ripe about as easily. They also should be picked just as they turn black. Their white flesh is a great advantage if it can be kept white, since it is much more appetizing. It has less oil, but not all the flavor is due to the oil, says Prof. Bioletti. C. C. Graber of San Bernardino county has also had great success processing ripe Ascolanos. This variety bears regularly and ripens about the same time as Manzanillos. "Where Manzanillos do bear well, they bear regularly; but the Ascolano seems safest of all, especially where lots of wind prevents Manzanillos from setting fruit."

The value of Ascolanos and Sevillanos according to Messrs. Martin and Underhill is chiefly in their size. They are purely for pickles, green or ripe, as they are not considered a satisfactory oil olive. There are only a few processors in the State who have made a success processing these varieties ripe; but that shows it can be done.

There is very little difference between these varieties, Sevillanos being a little longer and about the same diameter as Ascolanos.

In selecting Mission olive trees, it is well to learn definitely the size of fruit, etc., that grew on the stock from which they came, since there are several rather distinct types, not all of which are desirable.

Trebled Thompson Grape Crop.

[Written for Pacific Rural Press.]

"Last year I was so hopeless about this vineyard that I was ready to quit. The last crop was less than half a ton per acre of strings," said C. K. Hays of Kerman in Sept., 1916, concerning his 5 acres of Thompsons.

This year he picked 3000 trays, the berries "nearly as big as Malagas and the bunches like ears of corn." One vine had four trays easily. Where they had been picked when we saw them, the alternate rows were packed tight as possible with some on the sides, signifying over two tons of raisins per acre there.

"But the fruit wood I have for next year is what tickles me," said he. The canes were fat, hard, and mature already in September with none wasted away at the tips as is customary in many vineyards where the vines have not strength to finish their wood growth. I expect three tons of raisins per acre next year. It's the first time in the eight years I've been here that I've gotten enthused," said Mr. Hays.

The crop in 1916 was due to pruning and training the vines and pinching end buds. These irrigations were given in mid-April, late June, and late July.

The Fine Wood for next season was partly due to the methods which produced the crop as well as to a pinching of the canes in July to keep those that are to be used next year

from growing much over seven feet long, making them develop and mature fruit buds at laterals all along the cane.

"If I don't force the laterals out this year," said he, "they will come next year and sap the fruit buds at their bases just when the buds should be nourished by them. Because I forced laterals all along the canes this year, the fruit buds at their bases are all ready for business next spring. We get our big bunches from the plump buds beside good laterals."

Wires Fell Down.—Mr. Hays' wire trellis, stapled on the sides of the stakes, were not sufficient to hold this year's surprising crop. He had been advised last spring that the top wire should be laid on top of the stakes; and so it proved. Half of the wires were down in September, though the staples were ¾ inch long.

A WORD TO THE WISE

GRAPEGROWER, GARDENER and ORCHARDIST

If insects, rust, mildew, and blight eat up your crop profits, you need

THE AMERICAN BEAUTY DUST SPRAYER

"A puff in time saves the vine."

Awarded the BLUE RIBBON and DIPLOMA at the 10th Annual District Fair, Fresno, Cal., 1916.

The latest and best machine for the use of sulphur, Paris green, lead-arsenate, hellebore, tobacco-dust, lime, lime and sulphur mixture, or any other dust spray.

It is sure death to grape-mildew, or red-spider and mite on vines and trees—grape, prune, almond, etc.

It is a boon to vegetable growers—kills bean and asparagus rust and mildew, also worms, beetles, red spider, etc., on truck crops.

It is invaluable to cotton, tobacco, and cranberry growers, and for nursery and greenhouse stock.

IT'S FAST—IT'S THOROUGH

Has steady feed, continuous action, extra fine screen. Will cover almost double the acreage of any other machine in same time, and with same amount of material, because dust it throws is more finely divided. Positively will

not choke or clog. It is light and strong, easy to carry and easy to work.

Don't lose valuable time tinkering with a poor machine. A few hours lost at a critical time may cost you your crop.

For sale by all progressive dealers. If your dealer does not carry it, send us \$11.00 for the vineyard size, or \$13.50 for the orchard size machine, and we will send you an AMERICAN BEAUTY DUST SPRAYER, all charges paid. Try it a week. If it is not entirely satisfactory, return it at our expense, and we will cheerfully refund your money.

WE FULLY GUARANTEE EVERY MACHINE

BEES IN ORCHARD SET PRUNES.

[Written for Pacific Rural Press.]

Bees surely helped Frank Abernathy of Santa Clara County to get a heavy crop of French prunes last year; and he keeps eight or nine swarms at the house in his orchard all the time. It was last spring, under direction of A. H. Hendrickson of the University of California, that he put a tight mosquito net over two trees, one a French, the other an Imperial, just before blooming. These kept all bees and insects as large as flies away from the blossoms. Over two similar trees he put a net and inserted a swarm of bees. The nets were on several days until bloom was nearly over, when a wind blew them up one afternoon and it frosted that night.

The French tree, with the bees, bore a very heavy crop; but the Imperial did not have much, though an Imperial outside nearby had a heavy crop. The trees from which insects were excluded had practically no crop.

Possible explanations for the poor crop of the Imperial with the bees inside, are that perhaps the pollen of this variety is not good on the same tree, or that perhaps a freakish frost caught this without injuring the Imperial nearby, or perhaps water conditions were different at the time of setting. It would be interesting to have experiences of other orchardists who have observed definite results on any fruits.

BLASTING FOR RE-PLANTING.

To the Editor: My experience in tree-planting may be of interest to others wishing to replant old orchards. For six or seven years I had tried to get trees to grow where the original trees had died. In every instance the newly planted trees died, though carefully watered and tended.

So, in January, 1916, before planting, I had first blasted the ground with half a stick of 25 per cent dynamite, put down 3 feet at the spot where the tree was to be set out.

I put down the tree a little lower than it had been when dug in nursery, first being careful to fill the pot hole caused by blast, and using top soil around tree roots.

Now, though last year was pretty dry I used no water, either at time of planting, or after I set out 50 almonds trees, and not one died, and, except where they were in a few instances surrounded by old trees, all have thrived in sandy soil. Of course, before planting, all stumps and roots must be taken out, and it is folly to replant in places where only a single tree is missing. In such cases the young tree is simply starved out. The trees must be well-cultivated all summer.

Oakley.

E. W. Robbins.

BLACK KNOTS ON FIG ROOTS.

To the Editor: I have some two-year fig trees which do not grow well. I find small black knots on the roots.—M. A., Clovis.

The knots are caused by almost microscopic worms called nematodes. More rarely they are due to the crown gall bacteria. Nematode treatment is unsatisfactory, but the best

thing we have heard of is to build a levee that will include all the roots of the trees and a little more, put in a little fertilizer, and keep the basin full of water for six days. This drowns the worms that are not already in the roots and permits the tree to make a new tree growth without its being attacked. Shallow-rooted varieties like the Adriatic are particularly susceptible, so encouragement to deep rooting seems advisable. Deep subsoiling, even at the expense of some roots, and plenty of moisture deep in the ground without waterlogging it, will help. Keep the tree in the most vigorous condition possible so it may outdistance its enemies.

CALLUSING FIG CUTTINGS.

To the Editor: Last year I put in several thousand fig cuttings and didn't get good results. The other day I noticed an item stating that they should be cut, tied in bundles, set upside down in a trench, and covered with fine soil a few weeks to callus. Please advise how to tell when they are ready to come out, whether the trench should be under-drained, how much soil to put on cuttings, whether to keep wet or just moist, and whether sand is preferable to well-pulverized earth.—S. B. G., Princeton.

There are those who prefer covering cuttings upside down in bundles until they are callused; but G. P. Rixford, than whom few people know more about the fig industry, says it is not necessary. If you wish to do it, use sand or pulverized earth, whichever is most convenient, keep it moist but not wet, provide under drainage to be sure they do not get too wet, cover an inch deep, and take out when well callused, or when rooted. They are put upside down to prevent bud growth before callusing.

BARTLETT PEARS PROMISING

[Written for Pacific Rural Press.]

About six hundred acres of Bartlett's are to be found in the Tehachapi and adjoining valleys, of which two hundred and seventy-five are in bearing, according to former Horticultural Inspector D. W. Pitts.

One grower, B. M. Dennison, has forty acres which bore some last year; however, the crop was very light on account of frost coming when blooms were half open, which is very seldom the case. Mr. Dennison shipped one car of five hundred boxes weighing fifty pounds each, and received \$3.00 per box f. o. b. Boston.

Very little blight was found two years ago, but absolutely none could be found last year. The elevation is something like four thousand feet and picking does not start until September 5, which is the latest of any place in the State according to Mr. Killingsworth of the Pioneer Fruit Company.

FRUIT SUGGESTIONS.

Is root pruning of orchard trees about the time of top-pruning good or bad for them? What have our subscribers observed?

Apple spraying for codling moth is due now. Don't fail to use a little spray and save your crop. Add atomic sulphur if there is danger of scab.

Grape cuttings for rooting should

4 Cyls. 4 Speeds. Does work of 4 horses.

be cut off at the node, according to H. L. Wood of Stanislaus county; but for grafting, they should be cut between nodes.

Pear blight will be showing up on the blossom twigs pretty soon. Don't let it run down to the bigger branches. Remember that imperfect disinfection of tools and wounds will spread blight even while you are cutting it out.

Tulare county prune and apricot growers held an enthusiastic meeting last Saturday at which a number of members of the Association, additional to the already high percentage, signed up.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912.
Of Pacific Rural Press, published weekly at San Francisco for April 1, 1917, in the State of California, County of San Francisco, ss.

Before me, a notary public in and for the State and county aforesaid, personally appeared Frank Honeywell, who, having been duly sworn according to law, deposes and says that he is the Publisher of the Pacific Rural Press, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are: Publisher, Frank Honeywell, San Francisco; Editor, E. J. Wickson, Berkeley; Managing Editor, E. J. Wickson, Berkeley; Business Managers, none.

2. That the owners are (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock): Frank Honeywell, owner, San Francisco.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company, but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stock-

holders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

FRANK HONEYWELL,
(Signature of Publisher.)
Sworn to and subscribed before me this 29th day of March, 1917.

(Seal.) C. B. SESSIONS,
Notary Public, in and for the City and County of San Francisco, State of California.
(My commission expires May 26, 1917.)

MISCELLANEOUS.

SAN FRANCISCO LIVESTOCK EXPORT Co., Eugene R. Croley, Manager, solicits foreign orders for purebred registered and merit breeding animals and fowls. California has great diversity of climatic and other conditions that enable us to select animals that have been raised under conditions similar to those of the location for which they are intended. We should be informed regarding these conditions and be allowed ample time to make selections. Nearly all disappointments in buying afar are the result of insufficient information as to conditions or to lack of time for proper selection. Our plan and terms for "raising animals to order" to fit into peculiar foreign conditions is worth investigating. References: Dun or Bradstreet, or San Francisco banks. Office, 319 Underwood Building, 625 Market St., San Francisco.

ATTENTION, STOCK MEN! Population increasing, meat decreasing. Greatest rush in years for Government and State land. Free homes. Safe investments without residence. School, State, Indian, Government lands. Now available. You have nine rights now worth \$1,000 each. Booklet and 640 acre Homestead Circular Free. Write Joseph Clark, Sacramento, Cal.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

FEED, FREE RANGE, State, Government land, any amount. Booklet Free. Joseph Clark, Sacramento.

Orange Scaly Bark "Apparently Cured."

[Written for Pacific Rural Press by J. C. Perry, East Highlands.]

"Meticulous care" is the prime factor in the successful treatment of scaly bark gum disease of orange trees. This statement has reference to Bordeaux paste treatment under Prof. Fawcett's directions. Some growers seem to have the idea that the application of Bordeaux paste after a general scraping, or even without the scraping, has power to cure the disease. My experience with many trees, running back three years, indicates that success may be obtained by the surgical method provided enough care is exercised. The Bordeaux paste, being a fungicide, may prevent reinfection and, having considerable body and remaining for some time on the tree, may be the best possible protection to the inner bark where the outer bark has been removed. The application of Bordeaux paste alone does not effect a cure or even a sensible diminution of the disease. Assuming this to be a fungus disease (which has not been demonstrated) it would seem likely that any fungicide capable of penetrating the bark to kill the disease would be fatal to the bark. But success may be achieved through the surgical Bordeaux treatment, in cases not too far advanced, provided the factor of "meticulous care" is not wanting.

A number of trees were treated in the summer of 1914 with barely enough good results to encourage a repetition with greater care in 1915. Of the trees treated in 1915, one hundred and sixty received the mark "a/c" in the field book a year later, the meaning of the entry being "apparently cured." I do not refer to them as "cured" because, with the cause of the disease unknown, there is possibility of its reappearance. We do not know yet.

The tools used are lighter than those best adapted to gummosis of lemon trees, which latter have been described frequently. In "apparently curable" cases of gum disease of orange trees, it is necessary to remove little or none of the inner bark; but it is necessary to remove every bit of active disease. Where it does go to the wood it must be cut out. The first motion is a light scraping into the outermost green of the outer

bark with a light scraper made from a straight-edged bread knife, bought at a fifteen-cent store, handle riveted to blade, blade bent (to the left) into a U shape with abrupt corners, and sharpened by beveling to 45 degrees, beveled side outward. This scraping is more by way of exploration than for the removal of diseased bark and should go at least two inches beyond any sign or suspicion of the disease. Such scraping frequently reveals discolored, brownish spots at some distance from the manifest area of the disease. The discolored bark in these spots as well as in the central area of the disease must be removed. Different operators may prefer different tools. A three quarter inch carpenter's gouge, sharpened on the outside, held by the handle with one hand and guided by the other hand, which also rests on the bark, can be used with precision.

The work has been done for the most part in the summer season, not because this was the season preferred, but because it was the only time available. This has been a handicap in the case of bad trees that had to be severely topped, the best time for such work being before the spring growth. Where large limbs are badly affected it may be good practice to mark them for removal after the fruit is picked—and pick early.

For locating and recording diseased trees, tree numbers (preferably painted on the trunks with white lead) make a score for usefulness. Incidentally it may be said that a tree-numbering system is useful in various ways. The many thousands of trees of the East Highlands Orange Company are numbered and various items of information are recorded of the individual trees. When a gum-diseased tree is observed, either on a tour of inspection or by casual notice, its number is taken and copied into a special gum-disease record which shows the date of first observation and the condition of the tree at each treatment. If a limb is to be removed later, a memorandum to that effect in the field book is easier to find and the tree easier to locate than if the guide were a flag on the tree, especially if many separated trees must be remembered.

Mulched Basins for Lemon Trees.

[Written for Pacific Rural Press.]

Two years of mulched basining on 700 lemon trees of the Leffingwell ranch in Los Angeles county have greatly improved the fine heavy clay soil over the same kind of sub-soil. One year was not enough; for when the basins were worked up in the spring of 1916 with short heavy mattocks, the soil was very compact. Last February when it was inspected, the soil was quite loamy and loose. It had not been cultivated, except the one time.

Basins were made around the trees and as large as the spread of their branches. They were manured thoroughly, and a straw mulch put on top of that, but the manure and straw were kept away from the trunks, partly on account of rodents. Mounds of dirt were built up against the trees to keep water from the

trunks; but the mounds soaked up and stayed muddy so long that they were later leveled down. They are watching the trees close for gummosis, but none has been found, according to Lester Cole, who has most direct charge of the work. Irrigation was applied to the centers as well as to the basins for the sake of keeping the soil in condition.

A Manna gum eucalyptus tree owned by J. C. McCubbin of Fresno county is claimed to be the largest tree of its age in the world. It was planted in 1889 and measurements made by U. S. Dept. Agr. Sept. 12, 1916, showed it to be 17 feet 8 inches in circumference three feet above ground. On Sept. 10, 1915, it was 120 feet high and had a spread of bough 88 feet six inches.

Make your backyard pay dividends this year. Don't pay outrageous prices for vegetables when a few cents worth of seeds will produce all you need.

Buy a few packages of Germain's proven seeds today—and let Nature do the rest.

Germain's seeds will give you perfect results. They are adapted to California soil and climatic conditions.

Made Fruit Buds on Barren Peaches.

[Written for Pacific Rural Press by R. B. Cate, Clovis.]

My five-acre orchard of Elbertas, Muirs, and Lovells seven years old have always produced a rank growth, but have failed to set a normal crop of fruit buds; and those that formed were in top growth, which was taken off at the time of winter pruning. The trees are on a red variable soil with the hardpan coming close to the surface at places (1½ ft.)

By a radical change of pruning and caring for the orchard I have set an immense crop of fruit buds, which gives promise of the largest crop of fruit in the history of the orchard. In the winter of 1915-16 instead of pruning the usual severe way of leaving the main new growth four or five inches long in order to hold the tree down I pruned to a length of eighteen or twenty inches and thinned the inside of trees well to let in sunshine and air. The orchard was cared for in about the usual way in reference to plowing, cultivating, etc., until June 15. Then it was again pruned. This time the growth that was left eighteen to twenty inches in January (which by this time had sent out numbers of new shoots a foot to two feet long) was pruned back to six to ten inches. In a few cases the new growth which had grown from January to June was topped.

By cutting the limbs which had been left 18 to 20 inches in January, back to 6 or 8 inches in June, the tree was held back the same as severe winter pruning and had these added advantages: the excessive spring growth was removed, leaving sunlight and air into the center of the tree and the sap and strength which would have gone into the top was forced into the center or lower part of the trees where it is always needed.

After the pruning in June, the orchard was watered and cared for, developing what peaches there were on it.

After removing the crop, the or-

BLACK KNOT ON GRAPES.

To the Editor: What is the cause and cure of black knot on our grapevines?—D. L. S., Selma.

It is caused by the crown gall *Bacterium tumefaciens* and must be cut out to the outer edges of all infection on the trunk or arm of the vine. To help prevent reinfection varnish, whitewash or Bordeaux paste the cut surface. The bacteria work beyond where you can see any signs of them. The disease on grapes above ground is not generally serious.

KILLING EUCALYPTUS STUMPS.

To the Editor: What can I put on eucalyptus stumps to stop them from growing?—A. P., Ceres.

[Answered by Supt. John McLaren, Golden Gate Park.]

The best method is to strip the bark to one foot below ground level and cover the stump two feet deep with soil.

The United States Circuit Court of Appeals on Mar. 7 affirmed judgment for damages to Kellar-Thomason Co. for infringement on a patented means of attaching a valve or gate to the end of a pipe.

chard was thoroughly watered, which finished developing the crop of buds for this year and kept the tree growing until frost. I did not prune in the winter of 1916-17, but expect to prune about the middle to last of April or after peaches are set and danger of frost is past.

Though the orchard received no pruning in winter of 1916-17, to the casual observer it would in this March appear to be pruned, owing to lack of top growth. The trees are one mass of blossoms from the trunk to the top, which has not been true in the history of the orchard.

One Wound for Two Prunings.

Prunings 18 to 20 inches in 1915-16 and reducing this to 6 to 8 inches in June and not pruning in winter of 1916-17, the tree only received one severe wound in two years instead of two or more severe wounds.

This improvement was due entirely to Frank Henry's instructions and proper credit I am sure is due him.

Black Walnut Roots for River Bottoms.

[Written for Pacific Rural Press by Leonard Coates, Morgan Hill.]

The native black walnut stock is proving to be of great value under many varied conditions. It seems to be the only root that is resistant, if not immune, to infection from oak-root fungus, and should be used as a replant wherever any trees are affected by this disease. If old or mature trees are removed, it is often better to replant with strong two- or three-year-old black walnut seedlings, let them grow a few years, and then top-graft or bud to the desired variety.

If the orchard is young, or if the space to be replanted is large, there is no objection to planting grafted nursery trees. But another and perhaps even more important use for our native black walnut as a stock is to plant it along creek banks or in the islands or beds of loam found in many creek bottoms, or in soil largely composed of coarse gravel at the surface. In both cases it should be insisted that the roots be over two feet long, and it would

be much better if the length is three feet or more. The black walnut root grows very rapidly under such conditions, and readily follows down after moisture, which is soon apparent by the growth the trees will make. We are utilizing some creek bottom land of our own in this way.

Geo. Hyde of Cupertino planted walnut trees of the Concord variety on the native black walnut root seven years ago, picking as much as one hundred pounds of nuts per tree in some instances last year, and these trees were all planted in very gravelly land near the creek, but with roots 3 ft. long. The trees are of enormous size, and stand as an object lesson of what may be done over a wide area in similar conditions.

Planted along creek bottoms or banks where they would be subject to high water at times, the black walnut seedlings, set deeply, suffer no injury.

*Those things that
need your attention
on the farm:*

You, Mr. Farm Owner, who are about to make your first trip of the season to the farm, will find a score of things that need attention. Whether it is rented or "worked on shares," or whether you employ a superintendent, you, the owner, have certain things that you want done, will order done. And you want a record of how things look now:

Certain old fences.

The south porch.

The land that needs tiling.

The condition of the horses and cattle and hogs.

The foundation to the corn crib.

The broken hoops on the silo.

The condition of the orchard.

And one obvious thing to do is to make an auto-photo-graphic record. Make pictures of the things that don't please you, as well as pictures of the things that do please you. And alongside of each picture make a brief memo,—at least a date and title, an authentic, indisputable record written on the film at the time. It's a simple and almost instantaneous process with an

EASTMAN KODAK CO., 476 State Street, ROCHESTER, N. Y.

SAN FRANCISCO.

San Francisco, Apr. 4, 1917.

WHEAT.

offerings of wheat in the local market are practically limited to the California Club and Northern Red varieties and such few large lots as remain are being firmly held. The would-be buyer has not named a figure, but is forced to make offers. It is this practice that has made the quotations named below. California buyers are reported to be very active in the Pacific Northwest, although no large deals have been reported as yet.

Stocks of barley are so low that further quoting of the shipping grade is unwarranted. Every day last week saw advances made and similar occurrences are to be expected this week. On Wednesday choice feed stock was being held at \$2.60 on bids 10 cents off, with every indication that the asked price would have to be met.

BARLEY.

The demand for oats was very good last week and local holdings of Red Texas stock have been reduced too small to warrant further quoting. Shippers are still trying to secure stock, but the international situation has firming the market too much.

OATS.

Continued high prices on corn throughout the East have been reflected by good-sized advances in this market, with an especially noticeable upward movement on Milo. The country demand continues.

CORN.

BEANS.

The past week saw several lines of beans advanced, with most of the gains coming on Wednesday after the President's speech to Congress had been given out. On Monday and Tuesday of this week, there was practically nothing offered in this market. Large and small whites and re-cleaned southern Limas are sharply higher, and actual hostilities will mean an even greater gain on these varieties. Freight conditions are, if anything, worse than last week. Pinks and Bayos are also registered small gains. Teparies are again in demand, seeming scarce.

HAY.

Receipts for the past week were 2063 tons, as compared with 1883 tons the preceding week and 1480 tons the week before that. However, the feed situation is becoming so critical in the Pacific Coast and western states that prices continue upward and San Francisco dealers are daily forced to turn down possible business. Reports from Oregon, Idaho and Montana say that many of the roads there are impassable and hay has jumped to \$28 per ton, with large numbers of cattle dying. Utah is paying \$25 per ton for stock hay and Arizona reports that she has barely enough stock on hand for her immediate needs. In Washington hay prices have been pyramided in three weeks from \$12 per ton to \$25.50 per ton with instant buyers. There has been an almost daily advance in the San Francisco market and hardly a day passes that some up-state section does not either wire or send a delegation here to see if hay can be secured to save their cattle. Local prices are now at the highest level known since the winter of 1914. When transportation facilities are considered, it will be seen that present prices are really far higher than in 1914. Green feed is still very unsatisfactory, and this seems the only thing that can avert still higher prices here.

POULTRY.

With but one car of Eastern stock to compete, it proved very easy to maintain prices on California poultry. As the result of the light receipts of poultry, both geese and Belgian hare advanced. Squabs came in too large quantities for the trade to handle and sold at easier rates. Light broilers have started to come and the price is easier; while there was a sharp advance on broilers 1½ to 2 pounds.

BUTTER.

Prices on butter in every important dairying center in the United States advanced last week. In San Francisco the close was several cents above the opening figures. The shipping call continues as the dominant factor in this market, al-

though somewhat lighter offerings have helped maintain prices. March receipts were 2,378,400 pounds, as compared with 2,468,600 for the same month last year. The average price on the extras grade last month was 35.12 cents per pound. There is every indication that a firm market can be expected here.

Prime firsts.....37½ 37½ 38 40 38½ 39½
37½ 37½ 38 40 38½ 39½

EGGS.

Entries into storage and a good sized shipping trade have more than cared for increased receipts of eggs and local quotations closed steady at advances one to 1½ cents per dozen over the opening figure. Seattle and New York buyers have been very active here, and Southern California has been drawing its usual quota from this market. March arrivals were 2,318,830 dozen eggs and average prices during that month were 26.18 cents per dozen on extras and 24.75 cents per dozen on extra pullets. Entries into San Francisco ice houses last week were more than 15,000 cases.

CHEESE.

There has been considerable fluctuation in the quotations on California Flats cheese this past week, as the market was flooded with extra heavy receipts on two different days. March arrivals were 904,800 pounds of cheese with average prices during that time of 22.51 cents per pound on Flats fancy and 23.16 cents on Young Americas fancy. Jack cheese is in good shipping demand and advanced last week.

DECIDUOUS FRUITS.

There were no changes in the quotations on apples last week. Some shipping business was reported and ice house holdings are getting very low.

Apples:
Bellflower, box.....Not enough to quote

Special Livestock Market Report.

San Francisco, Apr. 4, 1917.

CATTLE: The prices quoted are for fed cattle; but grass cattle are beginning to come this week. Due to hard pasturage, these are likely not to be in very good condition and the price may have to be lowered. Grass cattle in general are likely to be in better condition in April and May than later. Not many fed cattle are offered and all are still held high. Feed in Southern California is in bad shape and considerable alfalfa acreage has been plowed up.

HOG: Offerings are slowing up a little and prices are unchanged at the highest mark in recent history. These prices can scarcely be maintained, but the breeder who has hogs to sell through the next year should make big money, notwithstanding the high prices of feed.

SHEEP: continue scarce, but spring lambs are already coming freely from the Huron-Columbia country. Due to scarce feed, these are not in good shape and the price of lambs is marked down a half cent.

WOOL: prices unchanged. San Joaquin Valley, except one large lot now being shorn, was practically cleaned up three weeks ago, with a lot of 800 fleeces from Bakersfield. Boston wool trade is dead, pending the possible Government comminatory of all supplies. There is likely to be something doing before next week.

HIDES: Nothing doing.

HIDES are still stationary per quotations of past few weeks.

Los Angeles, Apr. 3, 1917.

CATTLE: Market more quiet the past week. While prices are unchanged, feeders were more disposed to sell. The eastern markets being hardly so firm and the demand for beef falling off, killers were less anxious for supplies, but for all good to choice smooth steers they paid old prices. Fat cows and heifers were also steady but less active.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs.....\$9.50@10.00
Prime cows and heifers.....7.50@ 8.00
Good cows and heifers.....7.00@ 7.50

HOGS: With market continuing high east and higher all around us than here, there were fewer hogs in the past week and fewer wanted. With many tourists having returned home, and a falling off in the demand for fresh pork, killers were less anxious for supplies and refused to bid prices up, though they paid last week's quotations for what they wanted. California furnished most of the supply and what was coming in was mostly light weights. But few heavy hogs arriving.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs.....\$11.50@12.00
Mixed, 200@250 lbs.....12.00@13.00
Light, 175@200 lbs.....12.00@13.00
Though docked 20 pounds piggy sows 40 pounds and stags 40 per cent.

SHEEP: More coming in. Now that the fleece has been taken off, flockmasters are more disposed to let go their fat sheep. Offerings the past week, however, were only fair and prices steady and firm. Spring lambs coming in more freely and of better quality. They are selling fairly well at \$6.50@7.00 per head.

Per cwt. f. o. b. Los Angeles:
Prime wethers.....\$ 9.00@10.00
Prime ewes.....9.50@10.00
Yearlings.....10.50@11.00
Lambs.....13.00@14.00

CALVES: A good many coming in and the market the past week was slow and weak. Selling at \$8.50@9.50 per cwt.

No. Portland, Ore., Apr. 2, 1917.

CATTLE: Today's supply of cattle was larger than either of the last two weeks' opening days run, totaling over 1100 head. There was a fairly good supply of well-finished cattle in the run, while the bulk of the offerings were medium to good short-fed kinds. Prices as a rule were steady on the best grades. The beef trade was active with a good supply. Several loads of prime hay-fed cattle from Terbonne brought \$9.00 and \$9.65. There was a good spread of steers from \$9.00 up that sold at steady prices. Steers bringing from \$8.25 to \$8.75 sold at strong prices. Demand for these grades was excellent, buyers wanting this class of cattle to take the place of cows, which are very scarce. Thin light steers sold from \$6.50 to \$5.00. There was a light supply of cows; prices were all on a steady to strong basis, several good loads sold from \$7.50 to \$8.00, with a few going at \$8.25; medium grades going at \$7.00 to \$7.25 with ordinary stuff \$6.50 to \$7.00. Thin dairy cows sold from \$3.00 to \$6.50. Another record was established with the sale of one prime bull at \$8.25. Most of the good heavy bulls sold from \$6.75 to \$7.25; with thin ones from \$6.00 to \$6.50. Light dairy bulls brought \$5.00 to \$5.50.

HOGS: Some 1400 head of swine were on the market today. The market was slow in the morning. Two loads of prime heavy hogs brought \$14.50 and \$14.55; while the bulk of the sales were made at \$14.35 to \$14.40. Prices were generally 5¢ higher; pigs sold from \$12.75 to \$13.25 with a very light supply. Quality of the run was excellent and demand good.

SHEEP: Sheep receipts were rather light. Sheep and lamb prices continue to advance, although killers are having a slow outlet; shorn lambs are being quoted at \$11.25; market steady.

Newtown.....\$1.20@1.30

LOS ANGELES.

Los Angeles, April 3, 1917.

BUTTER.

Receipts of week ending April 3.....332,500
Receipts of past week.....304,650

The market the past week assumed a decidedly stronger tone. Production increasing and more coming in. Yet under the influence of higher and active markets both north and east, extras here were advanced 2¢ up to Friday. The consumptive demand was hardly so strong, but there was a very good shipping movement. Tuesday brought no change either here or east. San Francisco was off 1½¢, but this had no influence upon the market here. On call 5¢ was bid for extra, but no sellers. Receipts very light and receivers not disposed to let go at any price, holding their arrivals for their own trade.

We quote extra California creamery.....37¢

EGGS.

Receipts (railroads) for week ending March 27, 1917, 3,235 cases.

Receipts (railroads) for week ending March 7, 1916, 4,923 cases.

Market firm and fairly active the past week. Receipts much the same as a week ago, though lighter than the same time last year. Consumptive demand very good and prices held up very well, as eggs are cheaper than meat. Less buying by the cold storage people at the present high prices. San Francisco is 1½¢ higher than a week ago, Chicago ½¢ higher, and New York ½¢ higher. Here the market advanced ½¢ on extras and case count up to Monday and 1¢ on pullets. The market is 7¢ higher than this time last year. Tuesday the market on call was firm and there was a fair demand at Monday's prices. San Francisco was unchanged; Chicago and New York firm at the prices of the day before. The result was dealers on call were inclined to go slow.

Case count.....21 21 21 21 21 21

POULTRY.

Market more quiet and weaker for most poultry. Many tourists have gone home and the consumptive demand shows quite a falling off. Receipts were altogether local and mostly made up of young broilers and light hens, both of which were slow and lower. Heavy hens were scarce, in good demand, and higher. Roasters, turkeys, and ducks continue to come in slowly and sell fairly at steady prices.

We quote from growers:

Broilers, 1½ to 2 lbs.....30¢@31¢
Fryers, 2½ to 3 lbs.....28¢
Hens over 4 lbs.....23¢@24¢
Hens, under 4 lbs.....20¢@21¢
Ducks.....22¢@23¢
Geese.....18¢@19¢
Roosters, 3 lbs. up (soft bones).....26¢
Turkeys, heavy, 12 lbs. and up.....29¢@30¢
Turkeys, light.....24¢@25¢
Squabs, live, per doz.....\$1.00@3.00
Dressed.....3.75@4.85

ASPARAGUS.

With more coming in the past week the market was again lower. Local, Imperial Valley and Grand Island were all on sale. The Imperial Valley is bringing now 10¢@12¢ per pound, Grand Island 12¢@15¢ per pound, and local 8¢@12¢ per pound. While there was a fair demand, values are too high for much activity.

BEANS.

A firm but rather quiet market continues for seed purposes at old prices, but the trade bought sparingly at present high-

HAY CLEANED UP AND LESS BEING PLANTED.

Hay for sale in the country almost everywhere. Surrounding States are about as short. Even Utah is wanting to buy in San Francisco. Wheat hay is selling wholesale at \$60, the highest since 1864. Livermore Valley growers have sold at \$25 and in some cases even more. Pasture shortage has led to movement of hay from the city to the country. Yet there is still estimated to be more live stock in California than last year, having been held for higher prices in spite of pasture shortage. Alfalfa acreage has been plowed up and less is being sown than last year. Hay land is being planted to products equally high priced and of greater acre value.

prices. Whites and limas are steady, while pinks and teparies are higher again. We quote from growers:

Limas\$13.00@13.50
Large white12.00@12.50
Small white12.00@12.50
Pinks9.50@10.00
Blackeyes7.50@8.00
Tepary9.00@10.00

CABBAGE.

Not much choice arriving the past week. What came with good demand from shippers who paid \$4.00@4.25 per cwt. for such lots as would stand shipping. Poorer lots and less firm heads sold at \$3.50@3.75 per cwt. Cauliflower out of season. No more coming.

BERRIES.

While there were steady daily receipts the past week of strawberries, the arrivals were not large and prices were too high for an active movement. Still there was a

fair demand. Prices are, however, a little lower, especially on low to choice lots. Fancy sold much the same as last week. Strawberries.....\$3.00@3.50 Poor to choice, per case of 30 baskets.....4.00@4.75 Fancy, per case of 30 baskets.....4.00@4.75

HAY.

The market the past week was much the same as the week before. Not much coming in. A very good demand was had for horse hay, both from the home trade and the out-of-town buyers, and last week's advance was maintained. Dairy people continue to use mostly green alfalfa. Receipts, 48 cars.

We quote f. o. b. Los Angeles:

Barley hay, ton\$21.00@23.00
Oat hay, ton22.00@24.00
Alfalfa, northern, ton20.00@22.00
Alfalfa, local, ton22.00@23.00
Straw, ton11.00@12.00

Special Citrus Market Report.

Los Angeles, April 3, 1917.

Shipments of citrus fruits from Southern California from November 1 to April 1: Oranges 13,631 cars, and lemons 2,754 cars. Same time last year: Oranges 13,038 cars, and lemons 2,317 cars.

Shipments from Central California from November 1 to March 30: Oranges 4,052 cars, and lemons 104 cars. Same time last year: Oranges 4,210 cars, and lemons 146 cars.

With more settled and milder weather the markets the past week showed more life and the best oranges brought more money both east and west. The poorer lots, however, showed no improvement, though met fair sale. Shipments were the heaviest of the season, yet the eastern markets held up very well under the increased supply. Lemons, however, were slow sale and weak and at times lower. Locally, good highly colored oranges met very good demand the past week. Not so many culls on sale; and the improved markets east encouraged local packers, who paid 1 1/2@1 3/4 c per pound for oranges in the grove picked. Grapefruit while steady showed less life the past week. Prices, however, were maintained unchanged, packers still paying 2@2 1/4 c per

pound in the grove picked. Tangerines very quiet the past week. But few in and they were not very good. Packers paying 1@1 1/4 c per pound in the grove picked. Lemons continue as dull as ever. Only the best show any life and they are not active. Packers paying 1@1 1/4 c per pound in the grove picked. Low grades hard to move and no special price can be named for them.

AUCTION SALES.

New York, April 2.—Fifty-five cars navel, six cars mixed and five cars lemons sold. Market steady. Lemons lower. Weather cloudy. California Navels averaged \$1.80@3.50. Lemons averaged \$2.50@3.50.

Boston, April 2.—Thirty-four cars sold. Market higher in spots on oranges; unchanged on lemons. California Navels averaged \$1.85@3.40. Lemons averaged \$3.50@3.80.

Philadelphia, April 2.—Twenty-five cars sold. Market 10@20c lower on oranges; unchanged on lemons. California Navels averaged \$2.05@2.90. Lemons averaged \$2.75@3.60.

REMARKABLY FEW HOGS CONDEMNED FOR TUBERCULOSIS.

California seems remarkably free from swine tuberculosis as shown by figures furnished by R. P. Steddom, Chief, Meat Inspection Division, U. S. Department of Agriculture. Of the 310,870 slaughtered under Federal supervision during the fiscal year 1916, only 2,213, or 0.71 per cent, were condemned for tuberculosis. It is fair to say that many affected hogs are not totally condemned, and that a great many hogs slaughtered in California are shipped in from surrounding States as far away as Idaho.

General Agricultural Review.

CITRUS AND SEMI-TROPICAL.

Lindsay Valencia, picking will commence about the last of April.

Riverside citrus shipments are well over 100 cars greater than to this date last year.

Redlands citrus shipments are about 400 cars more than to the same date last year.

The young lemon orchard of the Mills Orchard Co. near Maxwell Colusa county, was not frosted this season.

A fig growers' meeting is called for April 7 at 2 p. m. at Ceres to consider selling prices of 1917 figs and the best means of canning California figs.

Butte county orange growers have succeeded in reading into the orange standardization bill a provision that oranges may be shipped, however sour, if "substantially colored" on the tree.

The Australian market for California oranges can scarcely be developed under conditions proposed in a bill before Legislature to permit green fruit colored by sweating to be shipped to that continent.

The dreaded citrophilus mealy bug which has resisted all efforts at control in certain citrus districts is being preyed upon by ladybirds brought from the Philippines last fall under supervision of H. S. Smith of the State Insectary. It was feared that they might not survive the winter. An effort will be made to breed them at the new Alhambra branch of the State Insectary.

DECIDUOUS FRUITS AND NUTS.

Many fruit ranchers near Clovis are leasing their land to the oil company for wells.

San Benito peach growers are being urged to join the Association to stabilize prices of dried peaches.

A carload of dried apples was shipped to Liverpool from Aptos, Santa Cruz county, late in March.

A great many cling peaches of the Linden district of San Joaquin county have been contracted at \$42.50.

Vacaville growers have been offered 6 1/4 cents for prunes, 7 cents for peaches, and 12 1/2 cents for apricots, according to the Vacaville Reporter.

Tin cans for fruit, fish, vegetables, etc., are costing 25 per cent more than last year and the demand is estimated at a thousand million cans more than the supply available.

About 8,000 prune and almond trees have been interplanted among the 400 acres of young lemon trees being brought to bearing age by the Mills Orchard Co. near Maxwell.

The Anchorage Farm at Orland, belonging to Mark Requa, is making extensive fruit plantings, including 160 acres of almonds, 60 acres prunes, 80 acres olives interplanted with prunes, 40 acres of lemons, and one of avocados. Figs and ornamentals are also being planted.

GRAPES AND SMALL FRUITS.

The Kingsburg pool, controlling about 1000 tons of Malaga grapes grown by about 30 vineyardists, have sold their crop for \$25,000. It is to be packed in a house to be built at Kingsburg for the purpose.

A newly imported ladybug for the citrus districts has proved able to withstand our winters and will be introduced to the grape mealy bugs in the Fresno district. "The pleasure is mine," the "ladies" are hoped to prove.

The playing children of many European nations will be seen driven by warriors from their green fields to America, as represented by a 50-foot melting pot on the Fresno Fair grounds during the Raisin Day festivities April 20. The melting pot will later fall apart, revealing these

children as doctors, lawyers, merchants, and useful citizens.

The State Board of Viticultural Commissioners report that the 1916 California grape crop brought growers nearly \$28,000,000. Of this, raisins from an estimated 140,000 acres brought \$12,000,000 or \$85.71 per acre average. Table grapes from 50,000 acres brought \$8,180,000 or \$163.60 per acre. Wine grapes from 170,000 acres brought \$7,500,000 or an average of \$44.11 per acre. Last year was the best of many for wine grape growers.

CROP REPORTS.

Accurate, painstaking, prompt crop reports as a patriotic duty to enable the Government to estimate the food supply of the nation are being urged on the County Horticultural Commissioners by State Commissioner G. H. Hecke, who points out that everybody, including the U. S. Bureau of Crop Statistics, relies on these reports as the most authentic.

The State Commissioner's report indicates but slight damage from frost and rain for the State as a whole. A few districts have had 50 per cent loss, but in general there has only been a good thinning.

"Stanislaus and Santa Barbara counties show normal condition; Madera, admits slight damage to apricots; peaches and apricots are said to have been pinched a little in lower San Joaquin. Hemet Valley reports some damage to apricots; Kings county is so close that authorities do not agree. Fresno reports but slight damage to peaches, and all down the line the average would indicate that with continued favorable conditions the crop of fruit and nuts in the State for 1917 would be one of the largest in its history."

From other sources, we have the following notes: The apricot and almond crop prospects have been greatly damaged by frost in Napa county. Prunes, cherries, and apples are in fine shape and prospects are for a bumper crop in that county this year.

Apricots slightly damaged by frost in San Ramon Valley, Contra Costa county. On the hillsides and where protected in the canyon, almonds and apricots look like a big crop.

Crop conditions Redlands to Beaumont look good; barley and oats three times better than last year.

On Mar. 30, ice again visited Fresno and vicinity, but it was thought that the damage was slight.

Deciduous fruits around Lindsay were hurt in the cold snap preceding Mar. 24, but it is thought that not over five or ten per cent of the Valencia orange crop was damaged.

Early plums in cold spots of Placer county were hurt and peaches nipped a little; but real reduction of crop was very slight.

Almond prospects in Butte county are fine in spite of the frost which made many orchardists work nights a few weeks ago.

At this early part of the season, it is folly to sell fruit on present prospects, for there are a dozen probable causes of reduction in the crop later on.

COW DRY SOONER FROM EARLY SERVICE?

Answered by Dr. H. B. Wintringham.

To the Editor: How long after calving is it customary to have a cow served? If served 2 to 3 weeks after calving, has it a tendency to make her dry up sooner? Do beet pulp and apples have a tendency to make a cow go dry?—H. J. V., Napa.

Any time after one month, depending on when it is desirable to have the next calf come. It will not have any effect on the tendency to drying up. Can see no reason why the foods mentioned should dry up a cow if fed in the proper amounts.

Patriotism, Like Charity, Begins at Home!

Home should be every man's castle. Not a feudal fortress to protect him from enemies without, but a place of quiet harmony where he may buckle on the armor of resolute readiness for "service at the front" in every-day affairs.

Therefore, true Patriotism may be expressed in making the Home a place of real preparedness.

Barker Bros. Great Confidence Sale

Is a patriotic offering to the homemakers of the southwest because it makes it easily possible for you to furnish just such a home at

A Saving of 10 to 50% of Regular Prices

By this Great Sale Barker Bros. are expressing their confidence in the Country, in Prosperity, Progress, and in the far-reaching influence of Patriotic Homes.

This is a sale of great importance to out-of-town patrons. If you cannot visit our store in person **Do YOUR BUYING THROUGH OUR MAIL ORDER DEPT.** and obtain the special bargains the same as if you came to our store, yourself.

Write us for what you need in furniture and furnishings—we can save you money.

We pay the freight for 100 miles and part of the freight for greater distances.

Agricultural Notes.

The Placer County Fair is to be held in September.

Kings County Fair dates have been changed to September 8 to 15.

The Sperry Flour Mills of Stockton shipped 400 tons of flour to Honolulu, March 31.

Danville Contra Costa county people, farmers and otherwise, are planting potatoes this year.

The first carload of asparagus from Antioch was shipped March 27, and another followed next day.

The Oakdale rice crop of 30,000 sacks from about 1,000 acres has been sold at nearly \$2 per sack.

Over 7,000 sacks of Butte City rice were sold last Saturday, mostly at \$2 per cwt. Rice seed is selling at \$2.15-\$2.25.

The first new potatoes were received at San Francisco March 29 from Livermore Valley. They sold at 10 cents per pound.

A sweet-pea carnival is to be held at Eureka, Humboldt County, in August. Cash prizes will be given for floats and floral exhibits.

About 12 carloads of cauliflower had been shipped from Walnut Creek previous to March 31. Most of it was raised around Lafayette.

Corn may be imported from Japan and Manchuria under special permits requiring sterilization with live steam on arrival in American ports.

State Fair activities have started. It will open Sept. 8 and the Native Sons of the Golden West will hold a three-day celebration there at that time.

The Irvine Ranch of Orange county raised about 225,000 sacks of Lima beans in 1916. At \$5.50 per sack, this would total about 1 1/4 million dollars.

The Hoag-Kellog Co. of Ventura have contracted for a large acreage of beans, mostly teparies, in the Popular district of Tulare County, at 7 cents. They are furnishing the seed.

Burdensome expensive provisions of the hay-baling bill before Legislature have been amended, due to a mass-meeting at Concord, where a committee was appointed for the purpose.

Through the Los Angeles Municipal Markets, fruit, produce, and poultry are reaching consumers at 25 to 30 per cent less than through retail stores according to Supt. J. P. Britt.

American fruit marketing methods are to be studied by a member of the New South Wales cabinet. Even distribution of fruit is his object, and he may get it sooner than we do, unless our growers hang together.

The Napa High School Agricultural Club has rented 12 acres of land for a corn breeding station, according to the Napa Register. Improved seed corn adapted to the locality is the object.

A thousand pounds of Egyptian cotton seed have recently been shipped to Yolo county for trials, to be supervised by the Yolo County Board of Trade. W. W. Harris of Esparto will plant 20 acres.

Carl Vrooman, U. S. Ass't. Sec. Agr., says that in this country only 72 per cent of the wheat berry is made into flour, while foreign standards are 77 to 85 per cent. The belligerents are making bread from wheat flour mixed with rye, barley, corn, and potato flour.

The report of the State Water Commission has just been issued. It covers information as to the law, how to make applications for water, a review of irrigation conditions, a survey of the water supply of California, and most anything you might want to know.

The Sperry Flour Co.'s Corn Day program and exhibit at Stockton March 31 attracted large numbers of farmers. The morning was taken up with the corn-growing machinery exhibit. In the afternoon the program consisted of addresses and discussions by University men and successful corn-growers.

Sudan Grass

CALIFLORA BRAND

This is one of the best-known forage crops used in the Southern and Middle Western States. It grows from 5 to 10 feet high and will produce four crops of hay under irrigation and usually two crops without irrigation. It thrives in the valley and foothill sections of California. It yields more to the acre than any forage crop we know of, and the quality of the hay is excellent. The stock of this seed is short and we anticipate higher prices in the near future.

BUY NOW—lb. 50c; 10 lbs. \$4.00; 100 lbs. \$35.00.

Alfalfa Seed

CALIFLORA BRAND

This is our best grade of common Chilian alfalfa seed. On every test this brand of Alfalfa Seed has surpassed all others. We do not believe its equal can be had elsewhere. When buying this grade you are not paying for any weeds or chaff. It is the cheapest to plant because it is the best. Send for price and sample.

We also offer superior stocks of GRIMM, HATRY and SMOOTH PERUVIAN and TURKESTAN Alfalfa Seed.

SEED POTATOES

Splendid stock of OREGON GROWN American Wonder, Early Rose and Garnet Chili Seed Potatoes. These are all good early varieties. Write for prices and quantities desired.

April-Sown Peruvian Alfalfa.

[Written for Pacific Rural Press.]

Peruvian alfalfa sowed in April by Frank Hasper of Imperial county proved a fine stand, though he says it would be better to sow there during the good weather in February on account of April winds. He has soft land.

Twenty acres of cotton stalks were disked down, first along the ridges with a little disk, then around the piece with a double disk and then across. The disks went to the axles before he finished. The ground was too wet to plow when he started the work. He broadcasted about ten pounds per acre April 2 and 3, 1915, after checking the land. On April 3 and 4 he irrigated the piece and then could not do anything until the end of April when the alfalfa was three or four inches high and "awfully dry." Irrigation in Imperial Valley while alfalfa is very small coats and covers it with so much mud that much of it doesn't survive. During its first four weeks, the alfalfa made roots six inches long, following moisture as the top dried out. It was irrigated then, being careful not to scald any of it by leaving water to stand on it too

long (over 12 hours of daylight). That is the cause of a thin stand on a few spots that are a trifle low in this field.

Last Season some hay was cut in March and 20 tons were cut at intervals through the summer when it got ahead of the cattle. Twenty-five Jerseys three to five years old were pastured on it from April 20 to September, with two horses. All but 10 head and the horses were sold then and the alfalfa was a foot tall when frozen about Nov. 7. All this stock had not been off the place during the times mentioned, nor had any other alfalfa been brought on. The frosted alfalfa was pastured and part made into hay, without injury to stock.

Winter Growth.—On December 1, the new growth was scarcely an inch high; but when seen Jan. 23 by a Pacific Rural Press representative, it averaged half knee-deep and was growing thriftily, while a few common Chilean plants were still hugging the ground. Peruvian should be planted thicker than Chilean, says Mr. Hasper, because its crowns do not get so big.

Alfalfa-Covered Field Shelters.

[Written for Pacific Rural Press.]

Field shelter for shade is desirable on most California farms during the warm summer season for both man and beast, the need for the former being most pronounced where field packing of fruits and vegetables is practiced, and the latter need being important with hogs.

Different materials are used in making a cheap roof for these shelters, such as straw, palm leaves, and in some cases boards. But George Peters of Kern county has found

green alfalfa most satisfactory and economical for such purposes.

In erecting shelters for his potato storing and grading quarters, he sets long posts in the ground upon which is nailed a substantial frame work. Heavy wire is then stretched back and forth across the top to support the alfalfa which is placed on green as it comes from the field. The drying and settling after the alfalfa is in place binds it securely to the wires, and wind will not dislodge it.

Sorghum Produces Much Feed.

[Written for Pacific Rural Press.]

Sorghum is a feed that livestock raisers should grow more of, in the estimation of W. D. Trewhitt of Kings county, who has had excellent results in growing it after a crop of wheat or barley on irrigated land has been harvested.

Mr. Trewhitt sows it between May 1 and July 15, according to the season; and so soon as it begins to head out, he starts to feeding it green to both cattle and hogs. As it is sweet, the animals relish it and eat stalk and all. Sometimes it can be

fed in this way as late as Christmas.

But whether all of it has been fed green or not, it is never wasted; for when it begins to get too ripe, it is cut and shocked and afterward run through a feed chopper and fed to the stock in the dried form. As it is still sweet, the stock consume practically all of it when chopped.

To show the carrying capacity of sorghum Mr. Trewhitt fed 24 young steers and 60 pigs on an acre last year from the middle of August till the middle of January.

March Planting of Sudan Grass.

[Written for Pacific Rural Press.]

Experienced Sudan grass growers seem to be unanimously in favor of early planting to secure the largest return from the land. It was with the idea of getting the longest possible growing season that 25 acres were being planted to that crop at the Stephens Dairy near Mission San Jose March 23.

Last year planting was delayed till after the first of May; and while one heavy crop of hay was harvested and a fine pasture crop followed, another crop of hay might have been added by earlier planting.

Naturally location has a good deal to do with time of planting, but as most of the land of this ranch is hilly with a southeasterly slope and seldom bothered with frost, early planting is not considered dangerous. About 15 pounds of seed were broadcasted per acre.

BERMUDA GRASS KILLED IN A SEASON.

"Bermuda don't worry me at all," says Ray Henderson of Imperial county. If you irrigate quick and

get the water off quick, the Bermuda won't germinate. But in a low place that stays moist the Bermuda will thrive. On account of the heat here, if we plow it up shallow and let it dry two or three months, that us-

ually kills it. Then cut it up with a disk, irrigate to compact the ground, plow and let it lie a month or so. If any of the grass sprouts, plow it again. A season of such treatment will kill it dead.

New Western Harvest Economy

WESTERN farmers, always on the watch for improved equipment to save time and money in getting the crops off the fields, are paying a lot of attention to **Deering Harvester-Threshers** these days. Many of them have bought and are using these efficient machines. Their success and enthusiasm means a big advance in rapid harvesting this fall.

Modern grain handling means harvesting and threshing in one operation, turning the threshing expense into clear profit, doing away with the big threshing bill and burden, saving time and long-drawn-out labor.

The **Deering Harvester-Thresher** is a Western necessity. Get acquainted with it. The **Deering** cuts a 9-foot swath, harvests 15 to 18 acres per day, and threshes clean as any thresher. Requires 8, 10 or 12 horses, and one or two men, depending on attachment used. In most cases a Mogul or Titan kerosene tractor can be used to best advantage.

The **Deering** has proved that it is designed and built right in every particular—strong and lasting, simple, of light draft. It can be used as a stationary thresher, too, by adding cylinder and beater pulleys, which are regularly supplied. A 10-H. P. engine does the work. Capacity 30 to 50 bushels of wheat per hour. Write us for an interesting folder on the **Deering Harvester-Thresher**.

94 Years in the ground and unharmed by Rust! —

IN 1823 the City of Cincinnati laid water mains made of oak logs with the centers bored out. To prevent the logs from checking, hand-made iron bands were placed tightly around their ends like the hoops on a barrel. Now after more than ninety years, these are being dug out. The bands are still in good condition because they were made out of iron that was practically pure.

"ARMCO" IRON CORRUGATED CULVERTS

are made of iron that is even purer than those old bands. "Armco" Iron is never less than 98.84 per cent pure iron while analysis shows that in both cases scarcely more than a trace of either Manganese or Copper can be found; and all their impurities taken together make barely one-sixth of one per cent.

This is why "Armco" Iron Culverts resist rust and give long and economical service. They represent enduring value for the taxpayer's money. Insist on having the longest lived culverts in your highways. The "Armco" Trade-Mark on every section is your guarantee.

For full information on "Armco" Iron Culverts, Flumes, Sheets, Roofing and Formed Products, write the manufacturer in your vicinity, or

Earliest Watermelons Sold at Home.

[Written for Pacific Rural Press.]

From five acres of watermelons raised last year by F. C. Perrigo of San Diego county, he sold every melon on the place. The patch is on a hillside along San Pasqual River, where not a great deal of travel passes; but Mr. Perrigo fixed up a very attractive cool-looking den between a lot of big boulders beside the road, covering it with palm leaves and fixing chairs and tables inside. They sold at 2½ cents per pound at first, dropping later to one cent.

Earliest in the Valley.—The standard variety in that district is the Chilian, but this and several other varieties were discarded by Mr. Perrigo after fair trial on his home place. Kleckley Sweets proved two to four weeks earlier than the Chilian. Harris Early was an early variety, but it grew large, hollow, and woody. To get the earliest melons, when four had set on a vine, the terminal buds were pinched, making the melons bigger also.

Fertilization and Culture.—The

soil is a decomposed granite loam 20 feet deep. What it seemed to need was nitrogen. This was applied in the form of 26 loads of chicken manure which was plowed under in March. Seeds have been planted for three years just when the peach blossoms were dropping—in March one year; in April the past two years. They were planted in hills 8 feet apart each way and thinned to four vines per hill.

Water was pumped up hill to a point whence it would run around the upper edge of the patch. From the upper ditch it was let down by a furrow midway between each two rows. Water was led from this furrow to each hill with a hoe. Each vine has a tap root that must be supplied with water deeply.

The stream pumped up from a well in the river bottom through a 1¼-inch pipe kept him uncomfortably busy, so a reservoir is to be constructed this season. Bugs did not bother until melons were off.

Hillside Preparation for Alfalfa.

[Written for Pacific Rural Press.]

On the C. T. Crowell ranch in Inyo county, there are twenty-six acres of hillside land, thirteen hundred feet one way, with an eighty-foot fall, and nine hundred the other, with a four-foot fall.

Last spring, Mr. Nellen, the foreman, leveled, and hired a man to throw up borders, ten feet apart, over the whole field, running the short way. This man was just thirty days making the borders with a ten-foot V.

In April, the field was sown and yielded two crops, only one of which was cut, the other being sold for sheep pasture at a good price, besides getting the benefit of the manure.

A pipe line fed by a mountain stream is run down one side of the field the long way, with an outlet or gate every hundred and twenty feet.

In cutting the first crop, the mower had to run between every two borders twice; but in raking, all space be-

tween three borders was raked at one time as four teeth were taken from the center of the rake, which space straddled the middle border.

This spring, the land being "set," all borders were knocked down, with the exception of every eleventh one, which was left and reinforced, thus making them one hundred and twenty feet apart or one at every outlet in the pipe line.

A gate was put in the borders every hundred feet and the space between borders corrugated three inches deep, two feet apart. The corrugator was made of four, four by sixes, nailed beneath a platform and equipped with iron runners and iron shoes in front.

One man can now irrigate the entire field in two and one-half days and keep water well under control.

The alfalfa is looking very good, considering the severe cold weather of the past month.—H. J. B.

SALTING HIDES.

To the Editor: How can I handle green hides to avoid hair slipping and too great shrinkage when I hold them three or four days before shipping? Have always salted them well.—G. P. G., Ontario.

Salt evenly all over, especially at the points, with 12 to 18 pounds of salt, after allowing the hides to cool thoroughly—perhaps six hours. If you have many and salt them in stacks, be sure that the outer edges, especially the points, drain toward the center so they will not wash the salt from hides under them. Have hides clean before salting and stack them flesh side up. If you have done all this, we will guess again.

MILO BETTER THAN WHITE EGYPTIAN.

If you were interested in the article under this head last week, you would like to know where the corn was grown. The article was written by Benj. Quigley of Linne, San Luis Obispo county, concerning his own experience.

BLOOD REPELS RABBITS.

To the Editor: Referring to the inquiry of A. F. K. of Ripon about how to keep rabbits out of the garden: If he will spray blood on the outer border of the garden, the rabbits will let it alone.

Santa Rosa. M. Branghler.

FUR CAME OFF.

To the Editor: How can I tan coyote and fox hides so the fur will stay on after tanning?—J. C. C., Raisin City.

Perhaps you have been skinning them before they were cold. If so, let them get quite cold and skin them out of the heat of the sun. Then proceed as usual with the tanning.

Wilt-infected seed potatoes can be detected only by cutting a slice from the stem end. If dark spots are found following the fibers from the stem, they are diseased; and if planted will not only infect the next crop, but will infect the ground so it cannot be cleaned of disease for many years to come.

790 Bushels of Potatoes

PER ACRE, THE LARGEST CROP
ON RECORD IN THE U. S.

Were grown in California and awarded Grand Prize by International Jury, P. P. I. E. Not only was this the largest crop, but the quality was especially fine, bringing a price considerably above the market. The grower attributed a good part of his success to the use of

Gold Bear Fertilizer

The average crop of California is about 150 bushels. What do you get?

W. V. Shear, Potato Expert, says: "Don't try to save money by adopting cheap methods to cut from cost of production. Is it not

good business practice to spend enough money to produce a good crop and make money on the investment rather than use cheap methods and lose money?"

Fertilizing is not an expense, but an investment, yielding immediate returns.

Let us help you solve the problem of bigger and better crops.

Raising Poultry for Profit

SMALL POULTRY PLANT.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

A few weeks ago I had occasion to go to a town lot plant, and found three varieties of poultry in a small yard. The runs were separated and each variety was being used as breeders. Now if there had been but one variety, the hens could have had more space for exercise. And that is the great feature in breeding—exercise. My friend took my advice, sold off two of his breeds, and turned his three yards into one.

A Good Sized House, open front, shed roof to give more sunshine than a gable roof, and a curtain to protect from winter storms, will give better results, in fertile eggs, than a poor, sunless house and a yard attached. By keeping a foot of clean litter in the house your hens will get all necessary exercise and be warm and comfortable. A house that appeals to me for small quarters is what I would call a story and a half high. This economizes space and is a change. For best results the ground should be prepared before the building is put on. Cement would be the freest from filth and from mites for the ground floor, but it is very cold. If the ground is saturated with crude oil for a foot or more below the surface, and pounded down hard, it will keep free from mites a long time. The north side or back could have a concrete wall the whole length of the building. For the rest let two pillars of concrete finish the foundation, and make small mesh wire panels to fit the ends and front. In cold, stormy weather, the hens can be confined to the upper story.

The upper story is the house proper. It must have a board floor, nest boxes, perches and dropping boards. These should be at the closed back of the building; and for the hens to get below two or more stairs will lead down. If the ground on which the building stands is raised a little above the level and made hard with tamping, it could be cleaned out indefinitely without removing any of the floor, as the litter would catch all dirt.

Make your brood coops in a row, for economy in space. Make your coops large enough for chicks to eat and exercise in when weather is bad, and build your runs out from the coops. One wire serves for two yards in this way. Ten-foot runs, even though not very wide, will give more exercise room than shorter and wider runs, because chicks like to run and spread their wings. You will save much vexation of spirit by using one-inch mesh, even though it costs a little more. Chicks will get out of two-inch. A brood coop five feet long and three feet wide will accommodate 50 chicks and a fireless brooder; or two hens that are agreeable can mother 50 chicks in such a coop and a run ten feet long and 5 feet wide. The coops need not be more than 2½ feet high in front facing the run and 1½ at the back. In bad weather the chicks can stay in until three months old and take no harm; but if you put

in more you increase the death rate; for chicks cannot be crowded. Even with fifty, they must be kept extremely clean to avoid risk. By building these coops in a row you not only save time, but lumber, nails, and labor, as three 6-inch boards of any length, according to number of coops made, will make the back; and there will only be two end boards needed, where if individual coops are made, each one requires two ends. The partitions can be of lighter stuff, or even of wire. The roof too can be made in one; but instead of making fast, it should be hinged at each coop and have props attached that can be lifted up in good sunny weather to let sunshine in. Individual roofs can be made and hinged at the side if liked better. If a fireless brooder is used, it should be placed at one end of the coop and the space at the other end left for scratching and feeding.

At the front of each coop a window 6 inches wide and 2 feet long should be put in about 6 inches from the top, and at the same end as the brooder is to be put in. After the window is in and fitted so that it can slide out, tack a piece of oiled muslin cloth over it on the outside. When the window is open, the muslin screen gives light and air without letting in wind or rain. Make the hole for entrance and exit of chicks under the window, and you have the other end of the coop entirely free from cold air or drafts of any kind. In addition, for better air prop the roof up a few inches in warm weather. If hens are used, you will have to make larger exits into the runways. A sliding door is best to keep out cats. The doors could be made in the form of a screen or of solid board.

Feed and water should be kept inside in bad weather, and in warm sunny weather you will have to make some shade if there is no natural shade. If nothing else is available tack a piece of muslin along the wire sides of the runs; that will make partial shade anyway.

Now as the chicks grow, by removing the brooder and putting in a frame of perches, these coops can be made to accommodate 25 growing chicks until they get quite large, or ten hens could be kept in them so that your coops never need be vacant or idle.

Just as soon as the cockerels can be distinguished put them in separate runs and feed them up so you can either eat or sell. They grow faster by themselves and the pullets always do better. Spray your coops often—don't wait until you see mites. Unless you get up before cock-crow, the mites will have gone back to bed.

QUESTION ANSWERED.

Hens Won't Set.—Can you tell me what to do to get my hens to set? They act as if they wanted to, then leave the nests and spoil my eggs.—Mrs. M. B.

First make sure that lice or mites are not driving the hens from the nests. If they are absolutely clean, all you can do is feed whole or

cracked Eastern corn, nothing else, and clean water. Corn is more lasting in a hen's crop than any other kind of feed, besides it is more heating, and that is what your hens lack. If there are no mites and lice a hen will always set, provided she is hot enough.

Poultry Breeders' Directory.

EXTRA QUALITY White Leghorn chicks. 12c until March 1st, then 10c. Carefully line bred from MacFarlane, Young, Martin, and Cyphers strains of foundation stock. Eggs, \$1.50 per 15, \$2.50 per 30, \$5.00 per 100, \$50.00 per 1000. Acres of free range connected with our breeding pens, 20,000 feet under roof. Only Jubilee incubators used; disinfected every hatch. Don't save 2c per chick in buying, and lose a dollar per pullet in raising; get the Best and Succeed. Newton Poultry Farm, Dept. 1, Los Gatos, Cal. Catalogue free.

THE J. K. BIGELOW POULTRY RANCH and Hatchery—300 acres devoted to superb vigorous Hoganized White Leghorns. Bigelow chicks are incomparably superior to the product of ordinary commercial hatcheries. Prices same as former seasons—10 cents each till April 1, 9 cents during April and May, and 8 cents thereafter. Shipped on approval; examination before paying. The Bigelow Poultry Ranch, Sonoma, Cal.

HIGHEST CLASS—Winners at State Fair, Oakland, Modesto, Reno. White Rocks and White Leghorns. Incubator chicks. Rocks, \$25.00 per 100; Leghorns, 10.00 per 100; Hatching Eggs, \$2.00; \$5.00, and \$10.00 per 15, according to quality. Rock Eggs, \$10.00 per 100; Leghorn Eggs, \$6.00 per 100, from range flocks. The best of stock and a fair deal. Mahajo Farm, P. O. Box 597, Sacramento, Cal.

ROOFDEN RANCH CHICKS are good chicks, well hatched from first-class utility breeding stock—money-making egg producers. The prices are right—7c to 14c, depending on breed, month, quantity (dozen to thousands). White, Buff, Brown Leghorns; Black Minorcas, Rhode Island Reds, Barred Rocks for dollars and sense. Send card for circular. Roofden Poultry Ranch and Hatchery, Campbell, Cal.

BARRED PLYMOUTH ROCKS — COCKERELS—Cockerels—Cockerels—Yes, we have them; also Hens and Pullets—all bred from our Champion Winners at California's leading shows. Also hatching eggs. If it's Barred Rocks you want, get in touch with me right away. Have bred them exclusively for nineteen years. Send for Catalog. Chas. H. Voden, Box 396, Los Gatos, Calif.

200-299 EGG BARRON LEGHORNS, Wyandottes; Buff Orpingtons, Wyandottes; White, Barred Rocks; Reds; Anconas. Fifty young Leghorns \$2-\$55, trapezoid 200-288 eggs. Scores first prizes—Don Blancos, Seven Firsts. Special Sale April 7-21. Ranch Lincoln and Piedmont. Visit or order. Eggs, Chicks, Breeders—everything reduced. M. Beeson, Pasadena, Cal.

"FINEST HATCHERY IN THE WORLD"—Baby Chicks, White Leghorns, and Rhode Island Reds, setting, 100's, 1000's, hatched right in our \$60,000.00 brick and concrete hatchery from our quality heavy layers. Reasonable prices. Stock, Hatching Eggs. Peabeside Poultry Farm and Hatchery, Sunnyvale, California.

BABY CHICKS—From large, healthy, vigorous, heavy laying thoroughbred Single-Comb White Leghorns. \$10 per 100; \$2 per 100 when order is booked, and balance 5 days before delivery. I pay the express to your nearest express office. H. A. Schlotthauer, Exeter, Cal.

WHITE LEGHORN AND BROWN LEGHORN day-old chicks from healthy, vigorous breeders. Per 100, March \$10.00; April and May, \$9.00. Reduction in larger lots. "Chicks well hatched are half raised." San Jose Hatchery, 373 Meridian Road, San Jose, Cal.

MAY AND JUNE CHICKS—Will lay this fall if from our early maturing strain. Our Leghorns and Reds begin laying at 4½ to 5 months. Leghorns \$10 per hundred. Reds \$12.50 per hundred. Brooke Farm (Rancho del Paso), 807 J St., Sacramento, Cal.

BABY CHICKS—From white Leghorns that are the result of severely hoganizing for the last six years. Our Barred Rocks are thoroughly hoganized; none can be better. April May and June hatchings. Atterbury Poultry Farm, Route No. 1, Box 183, Turlock, Cal.

BABY CHICKS—HATCHINGS EGGS—White, Buff, Brown Leghorns, R. I. Reds, Barred Rocks. Sturdy chicks from well-mated fowls. Prompt, efficient service. Write for circular. Campbell Poultry Ranch, Campbell, Cal.

BABY CHICKS—We hatch from our own stock of 10,000 vigorous, healthy S. C. White Leghorn hens of heavy laying strain. Write for price list and further particulars. George Brothers, Petaluma, California.

HOGANIZED AND TESTED—220-egg type White Orpingtons and Buttercups. Hatching eggs, chicks and cockerels for sale. Reasonable prices. For particulars, write M. Woodhams, San Mateo, Cal.

S. C. RHODE ISLAND REDS—220-egg record in 12 months. Hatching eggs, Chicks, Stock. Also Rose Comb Reds. Mating list ready. Wm. Larm, 3915 39th Ave., Fruitvale, Cal.

BABY CHICKS from S. C. White Leghorns from trapezoid hens with records from 192 to 297 eggs. Also S. C. Black Minorca chicks and eggs. J. W. Benoit, Route C, Modesto, Cal.

HICKS JUBILEE HATCHERY, Petaluma, Cal.—White Leghorn and Black Minorca chicks and hatching eggs. Circular "How to Raise and Feed Chicks" Free.

GIVE the Black Minorcas a trial. Guaranteed first class. Eggs, \$6 per hundred, \$1.25 per setting. Chicks, \$12 per hundred. Ezra Mosher, Union Station, Napa.

BABY CHICKS—From select free-range White Leghorn stock. Place orders early. Prices on application. Western Hatchery, Petaluma, Cal. W. S. Waldorf, Prop.

EARL E. SANDERS, Modesto, Cal., breeder of M. B. Turkeys, S. C. White Minorcas, S. C. Black Minorcas and S. C. Barred Plymouth Rocks. Nothing but the best.

S. C. RHODE ISLAND REDS—Pullets and Cockerels. One Black Orpington Cock. Eggs from R. I. Reds and Silver Campines. Mrs. E. S. Spaulding, Woodland, Cal.

MODEL POULTRY FARM—White Leghorn specialists. Our thirteenth year. Baby Chix and Hatching Eggs for sale. W. C. Smith, Prop., Corning, Cal.

"EASTMAN'S BRED-TO-LAY" Barred Plymouth Rocks—Chicks and Eggs. We Hoganize and trapnest. Fairmead Poultry Farm, Fairmead, Cal.

INCUBATORS—For Essex Model Incubators at factory prices, write Geo. H. Croley Co., Inc., Poultry Supplies, 631-637 Brannan St., San Francisco.

BABY CHICKS (White Leghorns)—shipped on approval before remitting. No weak ones charged for. Schellville Hatchery, E. F. D., Sonoma, Cal.

WHITE WYANDOTTES—Blue-ribbon winners. Eggs \$2 to \$5. Chicks, pullets, cockerels. R. W. Stawetski, Route 2, San Jose, Cal.

RHODE ISLAND RED and White Leghorn Eggs and Chicks. Splendid layers, large eggs. Send for circular. Rosedale Ranch, Hayward, Cal.

BLACK MINORCAS—Largest egg; whitest flesh. Eggs, \$1.00 per 13; \$5.50 per 100. Edward A. Hall, E. F. D. 1, Watsonville, Cal.

HATCHED CHICKS from Barred Rocks, R. I. Reds, White Leghorns. Good stock. Send for circular. G. L. Hawley, Madera, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, Cal.

LASHER'S HATCHERY, PETALUMA—Write for booklet, "The Day-Old Chick Business" and price list.

WHITE PLYMOUTH ROCKS—Hatching eggs from splendid layers. Mrs. J. B. Tupper, Route A, Ceres, Cal.

TURKEYS, DUCKS, AND GEESE.

THOROUGHbred French Rouen Duck Eggs for hatching from winners at San Jose, Oakland and Arizona shows. Also Bourbon Red Turkey eggs. Mrs. Emma V. Miller, Farmington, Cal.

MAMMOTH BRONZE TURKEY EGGS—\$3.50 per setting. Toulouse Geese eggs, 25c each. Mrs. M. Coghlan, Walnut Creek, Cal.

BRONZE TURKEYS—Young Toms for sale. No more eggs till further notice. Free circulars. Albert M. Hart, Clements, Cal.

BRONZE TURKEY EGGS—\$3.50 per dozen, immediate delivery. Brehm Bros., St. Helena, Cal.

PEKIN DUCK EGGS—\$1.00 per setting. L. D. Collins, Denair, Cal.

DRESS FORMS.

Dear Friends: With spring and thoughts of new clothes the subject of dress forms is apropos. There are adjustable and non-adjustable forms now on the market and their virtues will be discussed. The non-adjustable form still appears with small waist, well developed bust and hips and so does not represent the average woman's figure. However they are less expensive than the adjustable form and for those who are buying for themselves or people similar in size, or for those who have a form and have to continually allow for the difference in size, I will tell you that if you have a lining made very carefully to fit you, then place this lining on the form and pad it out, quite satisfactory results may be obtained.

There is a model of the adjustable form which divides into four sections—under each arm, front and back. It may be pushed in or pulled out, opened up or pushed together to give the shape desired. This model is usually satisfactory for a family's use and costs around \$8.

Then there is the real adjustable form on which the bust is divided several times, the hips likewise. This enables a very accurate imitation of the human figure by measurement. It is correct enough for fitted things, and is especially used by dressmakers for careful work on many different styles of figures.

The pneumatic form is made of exact measurements and then inflated. But it is usable by only the person to whom it belongs and that person's figure may change. Also women who have worked with it say that you have to be very careful of pins and for the home dressmaker who is experimenting that is quite a drawback.

Rosabella Best.

A NOVEL RECIPE BOOK.

A young housewife who is intent on gathering and preserving desirable recipes for her household work, has a novel and easy mode of arranging them so she can immediately find just the one needed.

She has taken a blank book about 6x8 inches, one that has a pliable cover and not too many leaves, and has made pockets into which to slip the recipe, when cut from some paper or given to her by a friend. To do this she has pasted the upper and lower edges of two leaves together, labeling each pocket and leaving a few pages between that and the next one for any notes on new recipes she cares to write. Thus she has all her recipes for meat in one pocket, cakes in another, etc.

It is much more convenient than having a lot of unsorted clippings to hunt over when she wants any special recipe. Try it.—Mrs. A. E. W., San Diego.

SIMPLE FURNISHINGS.

Most homes have too many things in them just to look at. Too many pictures, pieces of bric-a-brac, odd stands and frail chairs give a room a cluttered appearance.

A much more restful atmosphere is felt in a house that has only the necessary furnishings and those of simple styles.

THE HOME CIRCLE

LIKE A LAVEROCK ON THE LIFT.

It's we two, it's we two, it's we two for aye,
All the world, and we two, and Heaven be our stay!
Like a laverock on the lift, sing, O bonny bride!
All the world was Adam once, with Eve by his side.

When the darker days come, and no sun will shine,
Thou shalt dry my tears, lass, and I'll dry thine.
It's we two, it's we two, while the world's away,
Sitting by the golden sheaves on our wedding day.

—Jean Ingelow.

TAKING STOCK.

During the time of year when men are taking stock and laying plans for the coming busy season, women folk will also find it to their advantage to do likewise. Many wornout, or otherwise useless articles accumulate about a pantry or cupboard and should be disposed of. Perhaps, too, utensils and dishes could be more conveniently arranged. New ones may be deemed needful, and if so should be added, but it never pays to have more than are actually needed, as they are only in the way and require care.

Then, too, there are many new de-

vices which economize time and energy in doing housework, and these deserve consideration to see if they comply with one's needs. At times when help is scarce and inefficient, a housekeeper can well afford to own and employ every device or implement that will enable her to accomplish more work, better results, or conserve energy. A kitchen is just as much entitled to up-to-date tools, and these in first class condition, as is the barn. A few tools, wisely selected, in good condition and conveniently arranged, can be made to serve the woman's work bench better than the many.

Later when the busy season is on there is no time for changes, for work must then be turned off.

KITCHEN HELPS.

Once a week put a handful of sal soda down the drain pipes, then pour boiling water down them. This cuts the grease and keeps the pipes clean.

Cook all macaroni products in plenty of water. Always use boiling water and blanch with cold water when done.

To dye a white silk waist pink, use the package of color that comes in gelatine in the rinsing water and you will have a delicate pink.

Floral Department.

[By Geo. N. Tyler.]

Dahlia Planting.

You can plant your dahlia tubers from now on. Sandy soil is best for them. The way I plant is as follows: I dig a hole about six inches deep, but do not make the soil very rich. I put in a good stake about four feet long, one inch thick. I tack the label with the name of the variety to this stake. I put in the tuber in a diagonal position with the top and against the stake and then cover with two inches of soil. Be sure your tubers have a live eye, or they will not send up any shoots. I only allow one shoot to grow, and as it starts I fill in the soil till it is level with the top. Cultivate often, and as soon as the shoot is six inches high, pinch the top out and it will branch close to the ground. A branch will come at every leaf left on. When the flower buds form, give a heavy dressing of half-rotted manure, or you can use green manure and give abundance of water through the manure. By abundance of water I mean enough water that if you break off a branch the hollow inside will be full of water. Disbud for large flowers, and keep all old flowers cut off.

Hanging Baskets.

You can now start your hanging baskets. In making up a basket get a deep one made of wire, or wood rustic style, or what is best of all, a terra cotta basket made of same material that pots are made of. If of wire line them with live moss and fill up the basket with the richest soil you can procure. A liberal sprinkling of bone meal is very beneficial as it lasts longer, and your basket will keep in good condition longer. Use Kenilworth ivy, wandering Jew, variegated ground ivy, ice plant, or in fact any variety of plant that droops. You can use for center, achyranthes, lobelia, coleus, flowering begonias, and a variety of plants to suit your location. After the plants are planted in the basket, place it in a tub of water and let it stand for a few minutes, then lift out carefully and put in a shady place for it to drain and the new plants to get established. You can then cover the top with moss, as it helps to retain the moisture. After it is in strong growth it should be watered every day by dipping into a pail or tub of water. Never water with the hose, except to spray the foliage, and then only with a fine spray, or you will wash the dirt and moss from them and they will become unsightly. Never let them get wilting dry or they will soon become shabby. Remember they are hanging up in the air and in more or less draft, so they dry out very quickly. The pottery baskets are better for a dry place, for they do not dry out like a wire basket and they will stand more neglect.

Never try to grow a basket the second year for the soil is exhausted and it will never look well. Make them up new every year, or even twice a year, if you want to keep a pretty basket on your porch all the time. Very few baskets will stand the full sun.

To test the oven temperature for cake white paper should turn yellow in five minutes.

there's Health in this Can

Chocolate is an appealing food—perhaps the most delicious of all foods. It is likewise nutritious food—perhaps the most nutritious.

When you buy Ghirardelli's Ground Chocolate you get the grand prize winner, a chocolate of finest quality packed in a hermetically sealed can that holds all the Ghirardelli goodness in and keeps all outside evils out.

Good Health.

(By H. E. Pastor, M. D.)

Some of the Joys of Journalism.

In setting forth some views on the subject of vivisection the other week we innocently stirred up a hornet's nest. We didn't mean to do it. As a boy we once thrust a long stick into a rotten stump in an Illinois forest which happened to be the abiding place of a colony of hornets, and the response to that prodding was such that we never went looking for hornet's nests afterwards.

Now, it was not expected that everybody would agree with the views expressed in that item; neither did we expect exception to them to be taken in the manner of one or two critics, who turned themselves loose in several pages of vitriolic correspondence. He who writes to please everybody, pleases nobody—realizing which, we try to please ourself; that is, to speak out our abiding convictions. In discussing vivisection it was merely intended to set forth the writer's personal belief that the alleviation of human suffering is more important than the pain reluctantly inflicted upon lower animals, endowed with comparatively insensible nervous organizations, and the consequent forfeiture of their lives. Discussion of controversial themes is not usually profitable anyhow, and we propose to withdraw from the subject, for the time being at least, and retire for repairs.

The Fly Menace.

The house fly begins laying eggs soon now. The period of incubation and immaturity is quite short. Concerted efforts should be made in all communities to get rid of flies and the diseases resulting from fly contamination. Fly-traps are useful for this purpose. Bait the trap with decaying fruit, meat or fish. They revel in and thrive on nastiness. Their reduction will lessen the number of cases of typhoid fever and intestinal diseases, especially in very young children.

Summer Troubles of Children.

Children are very apt to get bowel troubles during the heated season, we learn from a public health report.

Many of these show that nature is merely trying to free the body of the child of harmful materials, but it should not be forgotten that any bowel complaint occurring in babies in the summer time may be the outward and visible sign of the beginning of a serious illness. Since improper food is the most common cause of this bowel complaint, it is the sacred duty of every mother to provide her child with proper food which should be carefully given at regular intervals. This means increased work for the mother, but this is more than repaid by the child's gain in weight, health, and strength.

PORK RECIPES.

Sausage Rolls.—Make a dough as for baking powder biscuits; roll out and cut in large rounds with a biscuit cutter; lay sausage meat on half of each piece; turn the other half over and pinch together; bake half an hour. Serve with brown sauce poured around it.

Ham Steak.—Put slices of raw ham in a frying pan with ½ cupful water to make them tender. When the water has boiled out and the ham is brown on both sides, dust with flour and pour on the following dressing, previously made: 1 cupful of cream and milk mixed, a little butter, 1 teaspoon mustard and a dash of tabasco sauce. Serve hot.

Pork Tenderloin with Potatoes.—Wipe tenderloins, put in a dripping pan and brown quickly in a hot oven; then sprinkle with salt and pepper and bake 45 minutes, basting every 15 minutes. Pare potatoes and par-boil 10 minutes, drain, put in pan with meat and cook until soft, basting with the meat.

Bacon and Liver.—Fry enough pieces of bacon a nice brown and put in the oven to keep hot. Pour boiling water on the slices of liver, remove the skin at the edges, roll in salted flour and fry slowly until well done in the bacon fat.

Ham Omelet.—Two eggs, 4 tablespoons butter, 2 tablespoons minced ham free from fat, pinch of pepper. Fry the ham for 2 minutes in a little butter. Then mix the ingredients all together and proceed as with a plain omelet. Serve hot.

To Keep Fresh Pork.—Roast as many pieces as you wish to keep, all ready to serve, then put them away in lard. All that is necessary is to reheat when ready to use.

Bacon and Fried Apples.—Fry the bacon a delicate brown and set aside to keep warm. In the bacon fat, slice tart apples and fry slowly until tender. Sprinkle with sugar and pile in the center of the platter and surround with the slices of bacon.

Braised Pork Tenderloin.—Three large tenderloins, ½ dozen slices bacon, 1 cup tomato, 1 bay leaf, 1 slice onion, minced fine, salt and pepper. Put the bacon in the bottom of the pan and lay the tenderloins in lengthwise. Pour the tomato over the whole and sprinkle the onion, bay leaf and seasoning over it. Add 1 cup water. Bake in slow oven for about 1 hour. Take out meat and place on hot platter, strain the sauce that is in the pan, add 1 pint water and thicken. Pour over meat and serve at once.

Roast of Pork.—Take a piece of loin about 3 lbs. in weight—score the rind across ¼ of an inch apart

and season with pepper and salt. Place in a roasting pan in a medium hot oven and brown. Then add ½ cup hot water and baste frequently

as the cooking continues. Turn the meat often that all sides may be well browned. When done, make a gravy from the liquid in the pan.

Mechanical Power on the Farm.

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

FORD ATTACHMENT GRINDS FEED.

[Written for Pacific Rural Press.]

A simple attachment to the crankshaft of Joel Anderson's Ford in Imperial Valley enables him to grind feed, cut silage, pump water, saw wood, etc., without straining the transmission. In cutting silage, it also pumps water through a hose over the top of the silo. As soon as a tank can be built on top of the silo, the automobile will be used to fill it.

To keep the engine cool on such work, no pump is used; but a barrel of water is connected with the radiator so that the surface of the water in both is at the same height and can run from the top of the radiator on the level to the barrel. A hose also connects the bottom of barrel and radiator. The warm water rises and flows into the barrel, while cold water from the bottom of the barrel replaces it in the radiator by automatic circulation.

The attachment is a heavy rod fitted onto the crankshaft to extend it beyond the front wheels. A five-inch pulley is put on for a three-inch belt and light work or low-speed heavier work, or a 10-inch pulley and four-inch belt for faster, heavier work. As the engine is 22 h.p. it can do any of the required jobs.

To brace the pulley when under the sidewise strain at work, a cross bar is fastened to the radiator bed and braces run to this from an axle boxing just back of the pulley.

The machine usually is set about 12 feet from the car and "will grind all the threshed corn a man can shovel into the grinder, but the engine doesn't overheat."

DIVIDED COST OF WATER.

[Written for Pacific Rural Press.]

In Coachella Valley, a dependable water supply available on short notice is necessary for those who grow vegetables in the hot sandy soil for early markets. Practically all of the irrigation is from wells; but a well is rather expensive for one vegetable grower alone, even if he has a little fruit and other crops too. Especially during the harvest time of many vegetables, they must be watered every night or day.

E. A. Miller and R. R. Cheatham helped each other by dividing the cost of a well and using the water alternately. Mr. Miller has 20 acres, part of which is occupied by 43,200 date seedlings which must be frequently watered, and the rest is in vegetables. Mr. Cheatham grows vegetables on about the same acreage, yet both together do not use the water over half the time through the year.

A 12-inch well was sunk 323 feet deep. The water comes within 26 feet of the surface in summer and 21 or 22 feet in winter.

A 15 h.p. electric motor and five-inch centrifugal pump deliver about 50 inches of water, not pulling the water level down over 12 or 14 feet. Pumping costs 18 cents per hour at 2c per kilowatt. Neither the motor nor the pump work up to capacity.

The fifty miner's inches furnish enough water in eight hours to cover four acres two inches deep. They cost 18 cents per acre inch, which is cheap enough.

TRACTOR GAS SAVERS.

To the Editor: You printed a note saying that gas savers are harmful to tractors. I know they are a good thing on automobiles. Why not on tractors?—C. B., Escondido.

[Answered by Prof. F. L. Peterson, Holt Mfg. Co.]

The only reason that a gas saver works satisfactorily on the automobile is that the engineer tends to have an over-rich mixture in the first place and that the gas saver actually does give him a better mixture. However, if this same automobile with the gas saver were used continually in low gear and up a steep grade which would correspond to the load that the tractor is always up against, the automobile owner would find out that his gas saver would be a detriment.

All the air has to pass through the carburetor to get the best vaporized mixture possible. When a man has an accurate carburetor adjustment for the particular load that he is working with, he cannot secure a better adjustment anywhere by having extra air enter at parts other than the carburetor. I would imagine that such firms as the Rayfield, Schebler, Stromberg and other manufacturers are alive enough to the situation to get their carburetor perfected as much as possible. If auxiliary air devices were necessary, I know that they would furnish them as part of the standard equipment.

CEMENT PIPE UP HILLSIDE.

[Written for Pacific Rural Press.]

E. H. Webb of San Diego county has an engine and centrifugal pump in the well on the river bottom, by which he forces water to a reservoir above the hillside house and dairy barn. There is a 65-foot lift and a 40-inch flow. The pipe is 1100 feet long, 8 inches diameter, and machine-made of cement without reinforcement, but with extra proportion of crushed rock and tamped very hard. One section resisted 120 pounds pressure before it broke. The cement pipe cost 18 cents per foot—less than \$300 laid under ground for the whole job.

Cement Should be Buried.—The pipe broke three or four times where it curves over a sharp shoulder 20 feet above the pump and was buried only 16 inches underground. Mr. Webb thinks if it were buried three feet deep, it would avoid the contraction and expansion due to summer heat and winter frost. Perhaps the extra dirt might help it to stand the pressure too.

TESTING VARYING OILS.

To the Editor: Some people claim there is a big difference in the quality of distillate and gasoline made by different oil companies. How can a farmer tell or find out for certain?—P. A., Lodi.

There is every chance for variation in the oils made by different

tures used. A U. S. standard test is being sought by the government so that all oil called gasoline, for instance, may have a certain flash-point and density. A farmer can get the instruments to test oil, but there is some danger in the uninitiated doing it, and we believe it cheaper to take representative samples to chemists who know how to make the tests accurately.

POWER FOR DAIRY HOUSE.
[Written for Pacific Rural Press.]
The dairy house of Ennis and Williamson of Riverside is supplied with water, steam, and power from the outside, so that everything is handled with speed, cleanliness, and economy for their whole milk trade in Los Angeles.

A tank for "tops" oil stands on a tower at a good distance. An underground pipe from this supplies the burner for a boiler where it is lighted very easily. The boiler supplies steam to heat water and sterilize utensils.

Another pipe from the "tops" tank supplies a 4 h.p. engine which runs a plunger pump to fill the water-tank on the separator house. This engine also grinds feed for the cows.

With the water above the wash house, it gravitates down through the milk cooler where the milk is lowered to 50 degrees, summer or winter. It also supplies the wash-room tanks for both hot and cold water.

POWER NOTES.
It is recorded that there are 25,000,000 horses in U. S. and 150,000 motor trucks.

F. M. Butler, J. R. Fountain, and E. L. Robinson of Banning have recently bought Bean tractors.

Seventeen tractors have been at work on the Chowchilla project plowing an average of 500 acres per day.

Hogs go to sleep riding auto trucks 45 miles to market, according to an Indiana farmer, who says they enjoy it.

Andrew Bonnickson and R. E. Lemoine of Brentwood are farming 1000 acres with two 75 h.p. Best Tracklayers.

Three Waterloo Boy tractors working day and night on the Mark Germain ranch in Imperial Valley, plowed 420 acres in ten days this spring.

E. G. Stinsen of Orange recently received his sixth carload of Samson Sieve Grips. Two of them went to Allen Bros. of Garden Grove and C. J. Klatt of Orange.

About 30,000 destructive fires per year are caused by people who leave current running through electric devices during their absence, as estimated by the Actuarial Board of Fire Underwriters.

Two new 36-inch centrifugal pumps were to be installed in March by the Rice Land & Products Co. of Colusa, who put in 1000 acres extra of rice this season. The new pumps have a combined capacity of 60,000 gallons per minute.

Over \$10,000,000 worth of motor cars were tied up in Detroit by freight car shortage at one time recently. The Hudson people sent caravans of new empty automobiles overland to points in other States where more freight cars were available.

120-inch Wheelbase

Mitchell
SIZES

\$1460 F. o. b.
Racine

7-Passenger—48 Horsepower
127-inch Wheelbase

One Type—In Two Sizes

Built Like No Other Car

This model plant—covering 45 acres—was built and equipped for this single type.

It is designed to build this one type at a cost which none can match. John W. Bate, the great efficiency expert, has spent millions of dollars to do that.

The savings go into extras. So the Mitchell has a wealth of features which other cars omit.

All Mitchell cars are designed by our artists, and built by our own craftsmen. So each style is exclusive.

A Distinctive Car

Mr. Bate has worked 14 years to perfect this factory and this car. Every building, machine and method shows the last word in efficiency.

His methods save us on this year's output about \$4,000,000. And all that goes into Mitchell extra values.

Our latest models are the result of more than 700 improvements made by Mr. Bate. He spent a year in Europe to get some of the ideas.

So the Mitchell offers, in many ways, what you cannot find elsewhere.

Unique Features

The latest Mitchells embody these distinct attractions:

31 Extra Features—

24 Per Cent Added Luxury—
100 Per Cent Over-Strength.

There are 31 features, most of which all other cars omit. Each is something you will want. Go see them. These are paid for by our factory savings.

On this year's models we add 24 per cent to the cost of finish, upholstery and trimming. Our new body plant saves the money to do that. This makes the Mitchell the luxury car of its class.

In the past three years we have doubled our margins of safety. Now each important part shows 100 per cent over-strength.

To Double Car Life

The object of this new standard is to double car life. Over 440 parts are built of toughened steel. Safety parts are all oversize. Parts which get a major strain are built of Chrome-Vanadium.

Our engine test is 10,000 miles without wear. Our gear test is 50,000 pounds per tooth. Our spring test calls for limitless service. Not one Bate cantilever spring has broken in the two years we have used them.

One Size, \$1150

Mitchell Junior is about like the Mitchell, but a slightly smaller car. Still it has a 120-inch wheelbase. It is the marvel of Motordom this year in the value that it gives. See which size you like best.

You will want these extras. And, when you know, you will want a Bate-built car. It means a complete car, a smart car and a lifetime car. It is the last word in efficiency. Let your dealer show it to you before the spring over-demand.

MITCHELL MOTORS COMPANY, Inc.

We Must Relieve the Alarming World Food Shortage

The world's food crop is alarmingly deficient, according to David Lubin of the International Institute of Agriculture, who says that the grain supply of the world is 130,000,000 bushels less than the normal requirements of countries open for trade.

[Written for Pacific Rural Press.]

IN THE time of our country's need, when perhaps millions of men are withdrawn from productive work, it behooves those who are left to study how they may make the land produce its utmost. Not only is this a patriotic duty peculiarly devolving on the farmers of America and California, but it is also likely to prove our most profitable work. Systematic study in a national way of food production and distribution has revealed marvelous wastes in both.

Now, when the civilized world, one country after another, is finding its food supplies less than have been considered necessary for continued existence, it will be well if we of America, about to enter a world war, shall apply the most stringent economy in the use of labor and land, in

patriotic study in the other phases of the struggle, including production of adequate food and clothes.

Increase Acre Yields.—Let those who have been content with small yields per acre devise ways of getting larger yields. Better and more timely plowing and cultivation, intelligent fertilization, liming, drainage, and irrigation, more co-operation and care in harvesting, packing, and marketing the products to avoid waste—you can put on whichever of the above-named shoes fits you.

Labor is likely to be scarce and we will have to pay higher wages. The increased production and prices will take care of this; but timely labor will often be unavailable. Labor-saving devices must be studied, adapted to our conditions and obtained for intelligent, constant use.

All available ground should be used for food production, now that men are being withdrawn for the war. Labor-saving machinery should be obtained. In the case illustrated above, a pumping plant at the creek would permit growing much food between the trees if sufficient fertilizer is applied.

order that the bravery and blood of our sailors and soldiers shall not have been made vain through the wastefulness of those who remain at home.

Everywhere, already, the great industries of the country are shaping their courses toward a ready compliance with any requisition our Government shall need. It is well that it should be so, for the American Government is what insures to us whatever we have of peace and prosperity, freedom of religion and speech and press, and the liberty that was given to us through the blood of our fathers, to hold in sacred trust for our children and our children's children. The liberties insured to us by our government are not only worth laying down our lives to preserve for future generations, but they are worth our most intent and

These include tractors, gang plows, subsoilers, automobiles (for business), auto trucks, telephones, dynamite, machine ditch diggers, gas engines, electric motors, pumping plants, corn binders, huskers, shredders, silage cutters, hay machinery, etc. The more these can be used co-operatively by two or more farmers, the more economy will be found.

What Crops to Grow.—What crops will be most needed? What crops can still be put in? What crops now intended for one use can be reserved for better uses?

The armies will be using principally those foods in which the greatest amount of nutrients can be most easily transported and kept eatable. The people at home will need some of these, but can also use the more perishable products such as fruits and vegetables.

OUR PART IN THE WAR.

WE are in the war between representative self-government and non-representative tyranny which blasphemously invokes divine right to exalt the few upon the rights, earnings and proper aspirations of the many. It is not a conflict of persons, but of principles. The United States as a nation has adopted anew the Declaration of Independence of despotism which was its birth certificate. The Congress of the United States has overwhelmingly declared the fact and generously voted the money to pay for action based upon it. The President of the United States has proclaimed the fact, the duties which it imposes upon citizens, the purposes which it will serve in human progress, and has appealed for manifestation of whole-souled, devoted patriotism in pursuit of those purposes. It is the American occasion and opportunity to make world-wide the beneficence of liberty, equality and fraternity, which men and women from all parts of the earth have been bringing in their hearts for the up-building of this nation for the last three hundred years. It is, as we look upon it, the crucial moment in the history of the modern world. It is really the time when "old things are passed away; behold, all things are become new."

At such a time it is almost impossible for one who feels coursing within him the blood of generations of those who resolutely sought freedom and equal opportunity for all men, to refrain from using such access as is given him to the public ear for almost continuous declaration of the nobility of such purposes and interpretation of the successive events through which they will advance toward full realization in the coming months and years. But, for several reasons, such use of our columns is not the end toward which we are called especially to minister. This nation is afire with patriotic zeal born of full knowledge of the world-value of the principles which called it into being and have remained to this day the greatest promotive influence in its wonderful growth and development. In every community, from country cross-roads to metropolis, there are men and women whose knowledge and power of expression are as good or better than our own, and it will be for them to remind their hearers or readers of their patriotic duties and opportunities and to interpret for them the significance of passing events of a general character. Therefore, such a task, delightful as it would be to see our ink flow in such channels, does not rest upon us, and we shall not undertake to gather for our readers news of the events of the war nor attempt to elucidate such events in their broader aspects and their relations to the great ends to be attained. Such work belongs to journals of general news and generalized public opinion. Ours is a special field and not less important because it is narrow, for it is fundamental and underlying all other fields and the activities pursued upon them. While then the war is being fought on wave or plain by those whose blood is thicker than ours, and being fought on paper by others

whose blood may be just as thin but faster-flowing than ours, it will be for us to pursue more zealously and pointedly we hope than hitherto, the truth about how to do American farming with success to the men and women who give their lives to it and with fullness and strength to the support of the nation and to the achievement of the task for humanity upon which it is now bravely entering.

THE AMERICAN WAY.

OUT of the responsiveness of the soil and the capacity of the great areas of it never tainted with feudality; out of the spirit, ambitions and opportunities of a people which has seen large from the beginning; out of the open-eyed vision for science, always measured for industry by the applicability of it to practical operations; out of thrift and frugality which were characteristic of these people who saw large and saw true before there was a body of assorted knowledge called economics; there has come an attitude toward farming as a business, and a mastery of capacious, efficient and unique methods in pursuit of it, which are recognized throughout the world as the "American way." Its policies, its implements and materials have accompanied its spirit to all newer parts of the world in which there has been an awakening to progressive agriculture. Its direct pertinence, its reasonableness and its capacity for production are displacing or modifying traditional farming methods in the most ancient countries. It has fixed the form and measured the extent of this nation's development and has disclosed such quality in this service that other nations, desiring to do new things in most efficient ways, are invoking its assistance. The other day Sir Arthur Lee, head of the newly-formed food production department of the British government, said:

"We intend to bring from America some two thousand tractor plows for night plowing. We need the skilled American farmers to supplement them. Five thousand skilled American farmers on English soil would go a long way toward combating Germany's plan to starve us into submission through her submarines. I have great respect for the ability of the American farmer. I have seen him at work and I know that everything he does spells efficiency. That is why we would like to have so many of him in the present crisis."

And if five thousand American farmers could thus strengthen England, what are five million of them doing for this country and what can they do for humanity, for equal rights and for democracy in the struggle upon which they are now entering? Much, beyond calculation, in all ways no doubt—for farmers are least inclined of all men to shirk duties and burdens—but in their own way, in their indispensable service, without which none would have strength either to fight or to flee, they will rise to their responsibility in the incomparable American way!

WHAT SHALL WE DO AT ONCE?

OBVIOUSLY everyone who has an atom of reserve power in food production should seek ways for its employment during the present growing season. One of our associates makes a number of pertinent suggestions upon the opening page of this issue. To well-read subscribers to whom these things are already known, let our discussion of them serve as a reminder. To newer and younger readers they may be more directly suggestive of things to be closely inquired into in the light of conditions which may render them wise or otherwise in individual cases. We are intending to enter very conservatively and discriminatingly into the hue and cry which is now afield, calling upon farmers to "grow more stuff"—because we are perfectly aware that the chances of losing are greater than the chances of gaining when one takes to plunging into cropping on the basis of a hue and cry. For example, there has been a large acreage of deciduous fruit trees set this winter with a considerable investment of money, for blasting, deep tillage, cost of trees and planting, etc., and the prime duty of the planter, in spite of all sensational exhortations, is to guard this investment and help the trees to justify it by this season's growth. It should be remembered that this season's rainfall is con-

siderably below the normal in most parts of the State and it will be a triumph of good farming to get the proper growth on young trees without irrigation. But the air is full of exhortations to planters to use this well-prepared land for inter-crops. Our advice to the planter is to do nothing of the kind—unless he knows perfectly well the moisture-retention of his soil and the requirement of the crop he inter-plants. If the planter is not absolutely sure what his land can do and what he himself can do to help it reach this optimum, he simply bolts into a game in which he may possibly net from nothing to ten dollars from the middles and lose fifty dollars in the tree-rows. And yet a lot of windy patriots are now urging him to do just that. And this is only one of several dangerous temptations into which the land owner may be led by popular clamor and greed of gain; as we say of one we say of all, watch out! Of course, if a man has moist land, or water from pump or ditch, and experience in handling the crop he takes his chance on, the conditions are very different. But the patriotic exhorters take little account of these things. They just yell out: "It is a sin to have land idle; fill it up with corn, sorghum, beans, etc., for the country will need them." They forget that we get practically no more rain for six months and that the trick is to keep the moisture now below, for such plants as it can properly carry through. They do not foresee that an inter-crop which only makes half-growth cannot repay the cost of putting it in; that lost in this worthless half-growth there are apt to be costly winter-planted trees dying of thirst in late summer and trouble later with the nurserymen because of claims that his trees were weak or worthless, when in fact they had no chance to grow. From all such perils of the ignorant or thoughtless, good Lord deliver us!

REALLY IDLE LAND SHOULD WORK.

OF course land already set for tree-growth is not idle and should not be so considered. With land which is really idle and, this year particularly, land which is idle because usually too wet and cold, much can be done at once and should be profitable if well done because prospective values promise to turn ordinarily poor chances of profit into good. It promises to be a great year for low moist lands and for counties which are usually more productive in years of moderate rainfall. There is really an extraordinary outlook for lands naturally over-wet. It is still early enough to rip up such lands with tractors and, where they do not carry too much alkali, to cover the ordinary blemishes of valleys with stretches of waving corn and sorghum and with beans which may find this year ample moisture for pods and not enough for too-late growing. Besides the large areas which will call for considerable capital to put into production invited by this peculiar season, there are many small patches of ground, either low on in hillside sags or dimples, which can be handled with ordinary teams and tools for summer crops of grains or forage, with advantage to the grower and for the general good. Of course most of our readers need no suggestions on this line and have already calculated or entered upon such chances. But there are others, rather new to diversifying crops, to whom suggestions will be helpful. It is along this line that our writers will proceed with such practical points as they have and can gather and we frankly make an appeal to the patriotism of our readers to lend their hands to such an effort. Many a man or woman who will not be able to raise an arm in our country's service, may greatly help the cause by writing the Pacific Rural Press a letter, stating any particular things they have successfully done with summer crops, describing the kind of land, the moisture available and the ways of planting and cultivation by which they turned land and moisture to good account by planting after the middle of April. Thousands of our readers have items of knowledge and experience along this line and general contribution of it through our columns will constitute a body of practical truth from which all can draw something which will be helpful in the effort they desire to make this season for both personal

and patriotic advantage. The general scolding and coaxing which are being dealt out to farmers from Eastern authorities, agricultural and governmental, have but little applicability in California, because they are largely misfits under our natural conditions. But we can collect practical wisdom from our own experience which will give our own people trustworthy information of what they can do profitably this summer with land and water.

LABOR COST PROBABLY A RULING FACTOR.

TWO weeks ago we indulged quite freely in comments on the requirements involved in increasing the acre-product of crops—claiming that notable change could only be made with cheap money, to be generously, but, of course, wisely, expended for better machinery, fertilization and other soil-betterments, adequate labor and assurance that all such extra investment would be more than repaid, through organizations for selling above cost. In this summer's problem these claims can be slightly redrawn because products are practically sure to sell themselves with ample profit to the grower who gets them while the war lasts. There may be chicanery of course, but the chances are that there will not be much manipulation against the grower this summer. The outlook therefore warrants wise expenditure for wells and pumps and for motor-driven, labor-saving machinery that water may be adequate and labor requirements reduced to a minimum. And that brings us to the suggestion that everyone considering extra cropping this summer look very carefully into the labor requirements of the crop he contemplates. Labor has been scarce and high priced; it will be worse in the immediate future,

at least. Not only is there an actual shortage and outlook for the farther reduction of it, but organization for wage-raising, which has been making considerable progress of late, will thrive under coming conditions. Organizers who not long ago were disposed to slam Asiatics as some kind of an inferior animal and the chief cause of their ill-luck, now look upon the Japanese as men and brethren and are seeking affiliation with them. We are not considering the questions involved in their general bearings, but wish to note the relation of the labor supply to all calculations of profit from extra cropping. Naturally the demand for such labor will coincide with the current urgent demand for labor, for practically all the proposed summer crops must be grown and harvested before frost comes. The farmer then who is figuring on putting in new land or new crops on old land, must carefully consider the labor requirements of each of such crops and not put in costs which a labor famine or too-high wages may make it impossible for him to recover from the land. If he has a crop which he can lash his teams or cough his tractor over, very well; but if he goes in for something for which he needs a gang of men for weeding, cultivating and harvesting he should be very sure he is not getting himself into a situation in which he may have to let the crop go or use the value of it to offset his pay roll.

We have been a long time getting into this unholy war, and probably none of us desire to get into it at all, but now that we are in it, it is up to the farmer to use his keenest insight and coolest judgment to be very sure he does not lay hold on the wrong end of it in his desire to do patriotic service.

seed can be broadcasted as heavily as two bushels to the acre and get a tall growth of slim stems which can be handled with a mowing machine and cured like coarse hay in our interior heat and dry air, but the land should be allowed to get a good dry surface before cutting. A second and third growth can be had from the stubble by irrigating after cutting. These growths are perfectly safe from stock poisoning if cured before feeding, but care has to be observed in feeding them green.

Beans in the San Joaquin.

To the Editor: What is the best time to plant beans? How close do I plant them? How often do they need irrigating? What kind is the best to plant?—R. A. C., Selma.

Beans are planted as soon as you are safe from frost—usually latter part of April or early part of May in your section—or a little later on cold land. Plant in drills or shallow furrows, 24 to 30 inches apart; dropping the beans two to four inches apart and covering about one and a half inches in medium loams and about twice as deep in sandy loams. Irrigation depends upon the soil and season's rainfall. Sometimes no irrigation is required, but the plants must be kept growing well until pods are set. After that they should not be encouraged to make too late growth by too much moisture. The varieties chiefly grown on the valley planes are blackeye, pink and teparies. Now that beans are in such sharp demand, teparies are selling better than at first.

Painting Trees Against Borers.

To the Editor: Will you give a good formula for painting trees for borers? I have used white lead, Paris green, and raw oil, but they seem to be able to get through it. How far under the ground would you paint the trunk? They are young trees, and I would like to keep them immune from the borers.—F. L., Voltaire.

We are not so much surprised that the borers "get through" as that the young trees do. We would not use an oil paint of any kind on young bark. Use a durable whitewash, such as is described on page 324 of our issue of March 17, putting on plenty of it down the stem to the root-forking and repeat, if necessary, to keep a good white color and prevent sun burn. We do not expect that the trees will be immune. Some borers will probably find a way in and the bark should be examined for dark spots, just above and below the ground surface, during late summer and early fall. Open such spots and punch to the end of the burrow with a thin, pliable wire, like a hair-pin.

Which Corn to Plant.

To the Editor: In growing corn for grain and not silage, which is the better—King Phillip Flint or Leaming Yellow Dent? Which bears the most ears to each plant, and if possible would like to know how large are they? My planter plants in hills, 3 grains 26 inches apart, and 4 grains 48 inches apart. Which would be best?—E. B. G., San Jose.

We have not the data for definite comparisons. It is our judgment that the common California preference for dent varieties is well based on superior size, yield, less suckering and California's long growing season. The exact size of ears, however, depends upon growing conditions and culture. Distance in planting should be determined on soil and moisture; closer planting, of course, for richer, moister soils. Set your planter according to the soil. We should expect more ears on the dent and would prefer it unless earliness is a matter of importance to you.

California Weather Record

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., April 10, 1917:

STATIONS	Past Week	Rainfall Data		Temperature Data	
		To Date	Normal To Date	Max'm	Min'm

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Sorghum Smut.

To the Editor: I planted Egyptian corn last year and there were several smutty heads scattered around in different parts of the field. If I plant the same field to the same kind of corn again this year, is it apt to be smutty again? The same field previously has always been cropped with small grains and has shown no smut at all. Does the smut come from the seed, the ground, or the weather? And would it affect field corn in the same way as Egyptian?—H. M. W., Wheatland.

Smutts of grains and grasses are caused by fungus plants which live as parasites upon the substance upon which they appear. Scientifically, there are different smut plants, but practically they are similar in form and operation. They all grow from very minute spores, which behave like seeds. These spores may come to the grain head from the ground or they may come with the seed or they may come from some distant place on the wings of the wind or of bird or bug. By whatever way they may come to the growing head of grain, they start to grow on the substance of the head (if growing conditions are right) and in building up their own substance they deform and destroy the substance into which they enter and produce myriads of spores to continue their species. They cannot be caused by the weather, though the character of weather often has much to do with their growth. Though the spore is so small that you cannot see a single one without a microscope, it is just as much the progenitor of the mass which you do see as a cocoon is the progenitor of a palm tree. The common smut of Indian corn is not the same as the smut of sorghum, but the chances of getting smut on Indian are usually better than of getting smutty Egyptian. The chance of a clean crop following is somewhat improved by cutting out and burning smutty heads as soon as you see them. What you get this year by replanting Egyptian cannot be prophesied exactly, but probably you will get no more than last year and you may get less or none that you will notice. Your infestation is certainly not bad.

Cruelty and Bird Killing.

To the Editor: Is there anything more cruel than trapping birds by means of holding them by

the feet to a limb of a tree until they starve and die? I refer to the article in the March 24th issue, "Tanglefoot for Birds."—Subscriber, Visalia.

It is surely very cruel. In the case of trapping or otherwise destroying marauding birds and animals, there is, however, to be alleged the promotion and protection of human interests, which often require cruelty. Besides, birds themselves are very cruel. The English sparrow destroys the eggs and young of other birds; the butcher bird impales large insects on thorns to die and become "gamey" for its own purposes, etc., etc. We dare not base an argument on this fact because our querist would reply that man, being endowed with moral sense, cannot be excused for cruelty because birds, which do not know better, are bad. There is, in fact, no use arguing about it. Inside the laws for the protection of animal life which represent, perhaps, the general human sentiment on the question, every one has to do as his own conscience dictates in sacrificing inferior lives when they interfere with his human duty to provide for his family and to do his share in feeding mankind.

Another point, of course, is that trapping or poisoning birds, destroys innocent and guilty alike. From that point of view we are more disposed to agree with our correspondent's condemnation of the tanglefoot method.

Sorghum Hay.

To the Editor: What variety of sorghum should I plant in this locality for cow feed? Also can sorghum be successfully sown broadcast and cured for hay? I have plenty of water for irrigation. What time and how much should I plant?—Subscriber, Pixley.

People and localities do not yet agree on just which sorghum is best for them. So far, growers are naturally apt to favor this and denounce that, according as one or the other gets more moisture or better culture. There has not yet been widespread, comparative test, under similar conditions, to demonstrate the matter. All of the sorghums, saccharine and otherwise, have been successfully grown for hay both in the South and in California, and they are grown in rows, in drills and broadcast. With ample moisture on good land the

The Laboratory as an Adjunct to the Farm

[Written for Pacific Rural Press by Miss Margaret Honeywell.]

HOW to reduce the high cost of living, how to make a good jelly when the weather is cool and sugar is cheap, how to guard against ptomaine poisoning, and how to best use the by-products of the farm—all these interesting problems and many others are being worked out under the direction of Professor Wm. V. Cruess of the University of California. This institution is conducting an experiment and research laboratory at its Berkeley location for the benefit of the farmer's household, and to further scientific and commercial ends. Questions concerning special processes are received from all over our State, the neighboring States, and from far-off Florida and Canada. These questions are cheerfully answered when possible, and special experimentation is entered upon to solve special problems arising.

A series of experiments on the pickling of olives has engaged the attention of the department lately, because of the widespread demand for a satisfactory method adapted to home use. Matters of more immediate interest to the housewife which have been worked on recently are the proper care of fruit juices, jellies and jelly stocks, candied fruits, fig preserves, canning of vegetables, of fruit and of meat, olive pickling, and the making of vinegar from cull apples.

Purposes of the Laboratory Work.

The aim of the department in carrying on this work is to establish a laboratory which will help the farmer in profitably solving the problem of disposing of his waste grapes, apples, citrus fruits, and the by-products of the canneries. On the average farm there are small miscellaneous plantings of fruit trees and berry bushes for home use. There is in these cases not enough fruit to market in the regular way, and yet more than can be consumed by the farmer's family. Every member of the household is busy at the ripening period, and much deplorable waste results. The culls, fallen fruit, fruit too ripe to ship, but in prime condition for immediate use—all this can be utilized. The means of saving this hitherto wasted food-stuff has been discovered and formulated by this wonder-working laboratory. The work here outlined is divided into several fields:

Teaching.—A laboratory course, which is not highly technical, but very practical under farm conditions. This course deals with farm products and the means of utilizing them all to the best advantage. The value of this course is not yet fully realized by all attending students. Many Japanese, however, are highly interested and enthusiastic students—mainly for the sake of Japan, their native country, where the large population and relatively small area of productive land make the fullest use of the harvest necessary.

Research Work.—This is carried on for the solution of special problems. One student, a Japanese, especially interested in rice, has discovered a method of hydrating that cereal so that it will cook in two or

three minutes, and when so cooked will be beautifully white and dry, with each individual kernel standing out separately from its neighbor. This process is to be patented before being made public.

Investigation of Fruit Products.—This comprehends efforts to discover the principles underlying the processes, and then standardizing them for use in the household and for commercial exploitation.

Correspondence.—As mentioned before, letters are received from all over California, the adjoining States, Florida and Canada, asking questions or soliciting recipes. These questions cover all sorts of appropriate subjects, and are answered forthwith, or made the subject-matter of experimentation.

Canning Beans and Other Vegetables.—Select young, tender beans; the smaller and more tender the pods, the better. String if necessary. Place in a wire basket or cloth bag and immerse in boiling water for two to five minutes. Remove from basket or bag and allow to cool. Pack into glass jars. Prepare a brine consisting of 6 ounces of lemon juice, 3 ounces of salt and 1 gallon of water. Fill the jars of beans with this brine. Place covers on jars loosely. Make a sterilizer from a wash boiler by placing a piece of heavy wire screen or a wooden grating to fit on the bottom of the boiler. This protects the jars from the direct heat of the fire. Place the jars of beans (covers on loosely) in the boiler on the false

so well as the pomelo. Cut the fruit in half, squeeze out the juice and strain. Add sugar to taste. Heat the juice to 185° Fah. in an agate-ware or aluminum kettle. Pour the juice into bottles, filling them full. Cork immediately with corks previously sterilized in boiling water. Tie the corks down with string. It is essential that no air space be left in the bottle below the cork, else the color and flavor of the juice will deteriorate. Heat a large pot of water to 175° Fah. and immerse bottles of hot pomelo juice in the water. Leave them for 10 or 15 minutes at 175°. When removed, the corks should be sealed with paraffine or sealing wax. This makes an appetizing "before-breakfast" drink, and also is suitable for

Student Examining Fruit for Bacteria in Laboratory, University of California.

The laboratory does not undertake extension work, being hampered for lack of time, and for the further reason that Miss Clark and Mrs. Fowler of the University Extension Department cover this field.

Work Already Accomplished.

This department works in conjunction with other departments and experiments on current problems. For instance, the State Board of Health has been working on ptomaine poisoning, its causes, etc. The laboratory has discovered that in the country this results oftentimes from improper canning in the home. The old methods of heating to boiling, and then putting the vegetable in cans, does not destroy the bacteria, but seems, rather, conducive to growth. Work was begun at once to find a new recipe that would be entirely safe. The discovery was made that a small amount of lemon juice, sterilizing the vegetable for two hours in the can, and then cooking the vegetable before using it, eliminated danger of poisoning. Inasmuch as this question is of paramount value and the recipe easily followed, it is worth knowing, and so is here reproduced:

Put in enough water in the boiler to come half way up the sides of the jars. Place cover on the boiler. Heat water to boiling and boil two hours. Remove cover from boiler at once and screw or clamp down the covers of the jars immediately, while the brine is still boiling hot. Remove the jars; turn them upside down on a table to circumstances omit the lemon juice in the above formula. If it is not used there is serious danger of ptomaine poisoning. Never use any canned vegetable with a bad odor. Always cook canned vegetables before using; there will then be no danger of poisoning.

Details for cooking other vegetables similarly will be found in Circular 158, which the department will furnish.

Unfermented Pomelo Juice.—For communities interested in citrus products there have been worked out numerous recipes for marmalade, candied peel, etc. But one of the most interesting recipes, giving something different, is that for unfermented pomelo (grape fruit) juice. The same method may be applied to orange or lemon juice, but these do not retain their flavor

punches of various kinds. A chemical thermometer is best to determine the temperature, although a good dairy thermometer will answer.

Apple and Other Jelly Stocks.—Very often it is inconvenient to make up jelly when the fruit is in season. It is perfectly feasible, however, to extract the juice from the fruit, sterilize it in bottles and keep it until it is desired to make the material into jelly. Fruit juice may be made into jelly very successfully if the following directions are followed:

Crush or slice the fruit and cover with a small amount of water. Boil apples 15 or 20 minutes, berries 3 or 4 minutes, and citrus fruits about one hour. Add water to the material and keep the fruit covered. Suitable fruits are apples, currants, loganberries, cranberries, blackberries, lemons, and oranges, mixed in the proportion of two oranges to one lemon, or pomelos and lemons mixed in the proportion of two pomelos to one lemon; or quinces and apples mixed in the ratio of one quince to one good-sized apple. Other fruits do not contain enough

(Continued on page 471.)

Fruit Crops in Good Condition.

[Written for Pacific Rural Press.]

The Monthly Crop Report, compiled by Geo. P. Weldon, Chief Deputy State Horticultural Commissioner, from reports submitted by County Horticultural Commissioners April 1, which include forty of the counties of California, show almost a full crop of all fruits excepting apricots and almonds. Fresno, Santa Clara, Sonoma and San Benito counties did not report.

Apricots seem to have suffered more than any other tree crop. Almonds were also nipped by the frost of March, although not so severely as apricots. Of the counties producing a large percentage of the almonds, Contra Costa reports a 50 per cent crop; Yolo, 65 per cent; Sutter, 85 per cent; Sacramento, 90 per cent; Butte, Colusa and San Joaquin, 100 per cent. These counties report 77 per cent of the entire crop of the State. The following counties produce 81 per cent of the apricot output and the reports vary from 30 per cent to a full crop: Alameda, 75 per cent; Kings, 60 per cent; Los Angeles, 30 per cent; Orange, 100 per cent; Riverside, 50 per cent; San Benito (no report); San Bernardino, 95 per cent; Santa Clara (no report); Ventura, 70 per cent; Yolo, 50 per cent.

Mr. Weldon has wisely confined his report on crop prospects to those crops where there were some prospects when the report was made. The reports on crop conditions, however, are also interesting if not taken to mean that such crops are assured. The almost universal report of 100 per cent on apples means simply that enough fruit buds for a normal crop had been made and had not yet been injured. The reports from Humboldt of 90 per cent, Napa 90, and San Luis Obispo 80, indicate damage already done to the relatively small number of apples grown there. The 75 per cent on berries in Monterey and Santa Cruz counties may mean reduced acreage as well as damage by cold weather. Cherries had been hurt in Humboldt, Riverside and Shasta counties, Riverside reporting only half a crop possible, as observed late in March. Fig and grape fruit trees were in normal condition everywhere. Lemons were reported in a condition below normal in Los Angeles, Yuba, San Diego and Ventura counties, where most of the lemons are grown. The condition of olive trees and fruit wood was normal everywhere except in Los Angeles. Oranges were reported already below normal in Riverside and Los Angeles counties. Peaches had been hurt in the lighter producing counties and also in Tulare and Kings. No damage had come to pears, whose fruit buds were in good shape. Plums had been hurt in several small-producing counties, and were reported 90 per cent in Sacramento and Tulare. In Placer, other parties report that a freeze March 31 killed 60 to 65 per cent of fruit in Loomis district, 20 per cent at Penryn on the lower land and in the Newcastle-Lincoln district. Tulare prunes were injured, Napa prunes still in shape, the other higher-producing counties did not report, but the conditions are good.

Only one very small-producing county reported any damage to walnuts.

CHERRY GUMMOSIS.

[Written for Pacific Rural Press.]

Cherry trees afflicted with bacterial gummosis to serious extent will be showing the results very soon. The disease has worked through winter and in some cases has girdled the trunk or large limbs. These will die when their stored-up moisture and food are gone. There may not be much gum, or it may break out from the bark at considerable distance from the point of infection. The disease does not progress much in summer time; and, if found, should be thoroughly cut out some inches beyond the edge of apparently diseased bark. When this has been done, trim off the edges smooth to make healing easy and disinfect the entire wound and tool with corrosive sublimate, one part to 1000 of water. The tree thus treated this spring will have good chance to resist the disease next winter.

NEW WHITE PEACH.

[Written for Pacific Rural Press.]

A new white freestone peach has been produced by Joseph Rossie of Inyo County, who says it is a cross between the Strawberry and the little-known "Sunland Queen." The "White Prince," as the new variety is called, grows very large, some of last year's crop measuring almost four inches in diameter. The flesh is pure white, firm, and fine grained.

White peaches must necessarily compete with yellow ones, in favor of which there is a pretty strong feeling among consumers because the best known varieties are yellow.

Mr. Grape-Grower

It is almost time for **MILDEW**

"A Puff in Time Saves the Vine"

Dry Sulphur Applied with

The American Beauty Dust Sprayer

will positively save your grapes from damage by mildew or red spider. Why? Because it is so finely divided and so evenly distributed. It covers every inch of leaf surface on every vine at a single stroke.

Red Spider and Mite

on vines and fruit trees, such as Prune, Almond, Citrus Fruits

can be easily controlled by the use of dry sulphur applied with an American Beauty.

Don't waste valuable time tinkering with a poor machine. Buy an American Beauty now, and be ready for emergencies.

For Sale by All Progressive Dealers

If your dealer does not carry it, send us \$11.00 for a vineyard size, or \$13.50 for an orchard size AMERICAN BEAUTY DUST SPRAYER, and we will ship it to you at once, all charges paid. Try it a week. If it is not entirely satisfactory, return it at our expense and we will cheerfully refund your money. Send for our circular and price list today.

Fertilizers Used by Peaches and Apples.

[Written for Pacific Rural Press.]

More plant food is required for a 500-bushel crop of peaches than for the same crop of apples or a 50-bushel crop of corn, according to experiments at the Arkansas Experiment Station, covering nine years from planting of the trees. The apples produced 3,675 pounds dry matter per acre; peaches 3,500 pounds, and corn 2,503. The apples used 6.61 pounds phosphoric acid in the crop; peaches 11.90 pounds, and corn 19.88. The apples used 13.45 pounds nitrogen in the crop; peaches 22.30, and corn 46.20. The apples used 43.05 pounds potash in the crop; peaches 59.50, and corn 15.96. The 500 bushel apple crop used a total of 63.11 pounds of the three plant foods; the peach crop 93.7 pounds, and the 50-bushel crop of corn 83.04. In the trees themselves, and their leaves, bark, etc., the peach trees retained at the end of the ninth growing season 27.67 pounds phosphoric acid, 87.97 pounds nitrogen, and 60.18 pounds potash per 100 trees per acre. The apple trees (planted 40 per acre) retained 6.73 pounds phosphoric acid, 15.26 pounds nitrogen, and 14.25 pounds potash. The peach trees had used and returned to the soil as leaves, prunings, etc., about double what they retained. The apple trees had returned less than they retained.

If in the nine years the peaches yielded 1500 bushels per acre, they took from the soil a total of 63.37 pounds phosphoric acid, 154.87 pounds nitrogen, and 238.68 pounds

potash per acre. Whatever of these elements were in the ground when the trees were planted and whatever had been applied later, over and above what the trees and crops took from the soil, had been leached away, evaporated, or still remained in the ground available or unavailable.

The apple trees, if they bore 1500 bushels per acre during the nine years, took from the soil 26.56 pounds phosphoric acid, 55.61 pounds nitrogen, and 156.27 pounds potash. All excess of these amounts originally in the soil or applied later, was not yet used by the trees.

Nine 50-bushel crops of corn, if the stalks were returned to the soil, would have taken 178.92 pounds phosphoric acid, 41.58 pounds nitrogen, and 143.64 pounds potash. It is scarcely fair to compare the corn with the fruits without having actual yields of the fruits rather than assumed total yields, but the figures on which the above calculations are based lead the experiment station to conclude that apple production exhausts the soil much less than corn or grain. In presence of sufficient moisture and other conditions suitable for fruit culture, 8 or 10 tons of barnyard manure applied per acre every three years, followed by green manure crops and proper tillage, is considered sufficient. Meanwhile, in the use of commercial fertilizers much less would be needed if they were kept available to the trees and not leached away.

Give Almonds Moisture, but Not Too Much

[Written for Pacific Rural Press.]

"Too many growers are inclined to use too much irrigation after planting, and little or no cultivation," says P. D. Bane, veteran almond grower of Glenn county. "The almond root requires less moisture than any other tree root; consequently it takes less to kill it. Water used at the proper time and in the proper amount is of much value. Good cultivation will bring better results than too much irrigation. I would recommend at least two or three cultivations per irrigation."

Yet even an almond cannot send roots where there is no water, and the subsoil ought to be kept moist from winter through summer by always getting the irrigation water down to the moist subsoil as quickly as possible, to avoid keeping the up-

per ground soaked a long time. J. T. Caldwell of San Joaquin county found almond roots 14 feet below the surface; and experiments indicate that they go much deeper if there is moisture and no hard pan. By every foot that the roots extend downward they open to use new stores of fertility. This is much cheaper than to buy fertilizers and keep working them in top soil, where roots cannot exist on account of cultivations and periodic drying. Mr. Caldwell's orchard is on sandy loam, 14 to 16 feet deep, underlaid by clay or shaly hard pan. He irrigated by a double furrow down the center between trees, not caring for the water to soak much sideways until it had gone deep below the surface, in order to make the roots go down.

Sandy Subsoil Reduced Apricot Yield.

[Written for Pacific Rural Press.]

Knowing your water-table often explains why fruit buds cannot set and mature fruit, or are not made at all. J. W. Murphy of Tulare county is one who will adapt his irrigation intelligently to the conditions. In the center of his 10-acre Tilton apricot orchard are 240 trees, on rather cementy, decomposed granite soil four feet deep over a subsoil of pure sand. There is plenty of subirrigated moisture in the soil all spring and summer until late July and August, when the ditch water gets scant. Then the trees on

this spot dry up and lose their leaves two weeks earlier than the rest. They try to make fruit buds in extravagant numbers, but are so dry that the buds later "fall off like hail." This 240 trees yielded about a ton of fruit, while the rest of the orchard yielded five or six tons. There would have been still less fruit had not the orchard been spring-toothed four or five times to help save moisture. The remedy is to irrigate this spot in August and September, while the fruit buds are forming and developing.

Apple Culture Affects Fruit

[Data by J. P. Stewart, Pennsylvania, in Experiment Station Record.]

The experiments involved a comparative test of mulch, sod, tillage, and cover crop treatments, both with and without fertilizers in bearing apple orchards in 1907-1915.

Summing up the results thus far obtained it is found that the mulch treatment reinforced by outside materials has been most efficient in improving the yield, growth and average size of the fruit in orchards up to about 20 years of age. It has also been most efficient in conserving moisture in all cases that have been determined. For orchards over 20 years of age tillage and cover crops slightly surpassed the mulch treatment, unless it was accompanied by adequate fertilization.

The sod treatment has usually given the lowest results in yield, growth and average size of fruit in orchards of all ages, except when aided by special conditions. On the other hand, it has excelled in color of fruit and in freedom from blight. Fertilized sod plats have generally given better results than unfertilized plats receiving a mulch or tillage. Both the sod and the mulch treatments require thorough protection against mice.

Tillage has generally done best in the fully matured orchards, where it is especially efficient in stimulating growth. Tillage has done well in the younger orchards when accompanied by proper fertilization. The experiments with tillage as a whole indicate that plowing deeper than four inches is probably undesirable and that most of the cultivation should be done with disk harrows, or similar shallow-working cultivators, rather than the plow. Cover crops have not proved especially beneficial unless the moisture supply was unusually good or the amount of food added was extra large.

In most of the experiments there has been a very close correlation between growth and bearing, except in the older orchards, when it is often possible to secure more growth than is necessary to maintain the best yields.

Two of the experiments indicate that annual crops may be maintained by such biennial bearers as Baldwin and Spy in the presence of ample food and moisture supply, by regulation of the yield in any year to prevent overbearing and by preventing injury to the root systems.

In some cases there has been a very marked correlation between the amount of fire blight and the rate of growth. The greatest damage has occurred uniformly on the trees making the most growth. In view of the fact that weakly growing trees have also been attacked, it appears that it is the intermediate growth that is most resistant to this disease.

Color.—Red colors in apples are developed primarily by sunlight in the later stages of maturity. Hence conditions favoring either of these factors, such as late picking, open pruning, long growing season, sparse foliage, fully developed fruit, light soils, or sod culture, will increase this color, while all opposing conditions will decrease it. By a proper utilization of one or more of these conditions it is believed that the customary harmful effects on color of heavy tillage or too much nitrogenous fertilizer may generally be overcome.

The size of the fruit is determined chiefly by the moisture supply, hence the cultural methods that conserve moisture most efficiently will normally produce the largest fruit. Other influences of importance are the number of fruits on the tree, supply of plant food, and the temperature and length of the growing season.

The Laboratory as an Adjunct to the Farm

(Continued from page 468.)

pectin (or jelly-making material) for the purpose, and must, therefore, be blended with equal quantities of apples, loganberries, or currants; for example, strawberries, apples, and currants used in equal quantities will make a good jelly stock; or loganberries, apples and strawberries in equal quantities; or apricots, figs and apples, one part of each. Various combinations can be made to suit the fancy of the maker of the jelly stock. Press out the juice from the hot fruit and strain it until thoroughly clear.

To test the stock, place one glass of juice and one glass of sugar in a small pot and boil until the liquid will sheet from a spoon freely, as in ordinary jelly-making. Pour the jelly into a glass and note if it becomes firm or not in a few hours. This is to make sure that the jelly stock contains enough pectin and acid to make a satisfactory jelly so that you will be certain that the material you are bottling will give satisfactory results. The jelly test made in this way should give a firm jelly within six or seven hours. If it does not "jell" satisfactorily, it should be boiled down until it gives a jelly.

Then proceed: Scald jars. Place the juice in a pot and heat to boiling. Pour it boiling hot into the jars and seal hot.

To Use Jelly Stock.—Whenever it is desired to make jelly from this fruit juice, merely take one part of juice to one part of sugar. Mix in a pot and boil down until the liquid sheets freely from a spoon or until it will boil at 221° Fah. Pour the jelly into glasses in the usual way. Jelly stock thus prepared has been kept in the laboratory for over a year, and has made very satisfactory jelly. It obviates the necessity of having a large number of jars, and allows the housewife to take advantage of the low prices of sugar after the season is over and to have freshly-made jelly for special occasions. It also distributes the cost of jelly-making over the entire year, and in this way makes the cost of the jelly seem less burdensome. Labor is conserved and material is used which might otherwise be wasted.

Thus the primary aim of the laboratory, to help solve the problem of utilizing the by-products on the farm, is in process of accomplishment.

Save Money Cultivating

With a

Bean TrackPULL SIX HORSE Tractor

For pulling a cultivating tool, the Bean TrackPULL Six-horse Tractor hasn't an equal. This little machine also excels at plowing, discing, harrowing, spreading and other farm, orchard or vineyard work.

THIS IS WHY

The Bean TrackPULL Six-Horse Tractor is superior because its weight is only 2875 lbs.; does not sink in or pack the softest soil. Efficiency: It is the Tracklaying type, traveling on its own track, giving long traction, and responds quickly when a turn is to be made. Power: It does the work all day long that six hard working horses can do working continually, and it never wants to loaf when the hot days come. Superior construction: It is equipped with Le Roi 4-cylinder vertical type, 4-cycle motor, Donaldson air clarifier, Bosch ignition, Famous Hyatt Roller Bearings and New Departure ball bearings throughout, Perfex radiator, water cooled with centrifugal pump and fan, combination splash and pump lubrication, and is so simple a boy can operate it.

Completely circling a lemon tree with a 6-ft. Double Disc.

Pulling 12-ft. Forkner Cultivator, making difficult turn. Distance between tree and fence, 12½ ft.

Write us for the name of nearest TrackPULL agent and other information.

Although we have just finished a big addition to our plant to supply the ever increasing demand of Bean Tractors, every indication points to a demand very much in excess of the possible production, and we urge you to get in your order early.

Fruit Markets Spoiled by Poor Quality.

[Written for Pacific Rural Press.]

The above head does not refer to last season, but to the season before. The reasons for that "season of very low prices for California fresh deciduous fruits" may well be taken as a warning even in these times of abnormal demand. Fresh fruit shipping will begin within a month; and now is none too soon to be preparing to pack our fruit right. Bills in the Legislature likely to become laws will also require stricter fruit packing. The author of the article below is an authority of many years' successful experience in growing and shipping California fruit to Eastern markets, a consistent fighter for honest packs, held in greatest respect by all who know him. His long experience leads him to think not only in detail, but also in broad terms of permanence for our fresh fruit markets:

"First and foremost, the quality of California fruit shipped east during the first part of the season was exceedingly poor; very much below average quality, and it killed the Eastern markets, and would have killed the Eastern markets under any conditions.

Inedible Fruit Shipped.—"The 'five weeks of rain in May' retarded normal development of peaches and plums; incidentally during that time ruined the entire crop of strawberries in the shipping districts, and a large part of the cherry crop. When those late rains ceased, June weather was warm and normal, resulting in early plums, such as Clyman, Red June, and Climax, ripening up more or less quickly, but before they had sugared or matured properly. Those three varieties, this season, were hardly edible. I saw Climax, which were packed for Eastern shipment, and held here until they had turned red all over, which had no flavor whatever—in fact, could hardly be eaten. This same thing applies also to Triumph peaches.

"One district started these shipments very early and sent a large quantity of that trash into the auction markets, which sold, after the first few cars, for almost nothing. Another district followed in due course with more trash, though I believe a little less 'trashy'.

Should Have Thinned Fruit.—"Another cause of the inferior quality of these early varieties was the excessive crop; and growers all over this county did not thin properly. Even our own orchards, under the direct supervision of our orchard superintendent, should have had two-thirds of the fruit thinned off, but it was not properly done; and that applies to the whole district up here.

"Before the California shippers had discovered the effects on Eastern markets, the damage had been done.

"By the time Santa Rosas, Placer County Burbanks, etc., were ready to move, Californians had discovered the real conditions, and, at least from this county, greatly improved the pack. Shippers set higher standards; and, when buying, set prices according to quality, with the result that the last half of the season,

quality has been very fine.

Proper Care Made Profits.—"From all I can hear, shippers and growers alike have all learned a bitter lesson, and it is driven home to them by the exceptions to the rule. By this I mean that we have a few growers who did thin their fruit properly, and who did wait until the stuff was actually edible, well colored and matured, before packing—the fruit from these few people, showing up for itself in the boxes, being fine size, etc.

"Even in the midst of gluts and slumps, when fruit was hardly paying freight charges, these few bright lights showed up with normal prices and they have made money where others have lost.

Eastern Competition.—"Another big contributing cause to low prices this season, as you know, is the enormous competition from home-grown fruit in every district of the United States and Canada. I have found many growers who have no conception of the thousands of carloads of peaches offered for sale in the United States this season, to date.

Must Leave Poor Stuff at Home.—"Quality of California fruit is the prime requisite for success. William Sproule said, 'California is the champion long-distance shipper of the world'. I always have been convinced that we should leave our poor stuff at home. But this year I have clinched that conviction.

"If all the growers this year had properly thinned their crops, and shipped East only fruit that was really matured and sized up, so that it would attract the trade, both from its intrinsic value as food and from its appearance, there would be much more money in circulation here as a result of the sales, and we would not hear so much of disaster. Now I claim to know that it is possible to raise high-class fruit in the California shipping districts; and that growing inferior fruit is nothing but suicide."

PREPARE FOR FRUIT THINNING.

Very soon it will be time to thin peaches and apricots. F. F. Ebert of San Diego county proposes to wait until a heavy crop is safely set, then cut out the slender fruit wood, leaving the most vigorous. The fruit on this will have to be thinned by hand just as the pits begin to harden.

SPLIT ORANGES REDUCED.

[Written for Pacific Rural Press.]

Reduction of the number of split oranges is credited by Adolph Butze of Tulare county to the even supply of moisture given his trees, in connection with a straw mulch put on the ground in June and July.

"I think there were not over four splits per tree out of their crop averaging five hundred oranges per tree," says he, though neighbors have a much larger percentage.

"Many folks allow five or six weeks between irrigations and then give lots of water. I think that causes the splits which we find, especially in August and September."

Mr. Butze uses 35 inches of water ten days per irrigation on twenty acres. He waits only twenty days between irrigations; and less in July, August and September. On

a ten-acre piece he turns the water into 116 furrows at once, allowing it to soak deeply and slow. The soil is a tight red clay, which dries and bakes easily.

Get the Right Kind of Powder for Stumping

"The farmer needs to know that he is getting quality in the powder that he is purchasing," says the *Western Farmer*. "If he secures the right kind of powder, the cost of removing stumps is greatly lessened."

The right powders to use for stump blasting are

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

made especially for stump blasting and other work on Pacific Coast farms. "What the farmer should do," says Prof. G. E. Bailey, "is to use an explosive especially prepared for his work; one that stands all ordinary shocks of handling and does not easily freeze. He should not use expensive nitroglycerine explosives."

The Giant Farm Powders—Eureka Stumping for dry work and Giant Stumping for wet work—meet these requirements. They save work in land clearing because they lift and heave over a wide area, and get out roots and all. They save money because they go further than dynamites that merely shatter. Write us if your dealer cannot supply you with the genuine.

Five Books Free

Quick Sulphuring for Grape Mildew.

To the Editor: It was with interest that I read the article on "Grape Mildew Annihilated." It seems to me that Mr. Schleuter worked too hard. I always consider sulphuring my five acres of vines a "before breakfast job." It takes me two hours to apply each of the first two treatments, and three hours after the shoots have grown out. My vineyard is trellised, which makes two-thirds more work than with staked vines.

The difference between his and my experience lies in the machine used. I just know from his letter that he used one of those dinky little Italian machines. They give about one and one-half pints of air at a puff, which necessitates sticking the tube into the vine in order to get the sulphur there.

I have had twenty-four years' experience in vineyard culture, and have employed every method used for applying sulphur. I believe that it pays the farmer, as well as any business man or manufacturer, to discard his old machinery and buy new, improved types. It enables him to do his work quicker, easier, better, and at less expense.

It is of the utmost importance to be able to sulphur quickly when the need arises. Ill timed applications of sulphur are responsible for a very large percentage of crop failures due to mildew. After the sprouts are out three inches it is time for the first treatment, and one must begin to watch the weather. When two weeks have passed, it will be time for another treatment.

Suppose, on looking around the horizon a week or two after your first sulphuring, you see the old familiar signs which mean a change for cool or foul weather. This, you can then know, is perhaps your last day of warm weather for who knows how long. If you can get the sulphur on before noon, the warm air and sun in the afternoon will vaporize the sulphur, and clean up your vineyard before the spell of cool weather, when it would be useless to put out sulphur. Hence the necessity for a machine that will do your work quickly.

I have used all makes of sulphur machines in my vineyard, trying always to find one that was satisfactory. Last spring I got hold of one of the new American Beauty sprayers, and it is absolutely satisfactory in every way. I can sulphur thoroughly a staked vine at one stroke. I do not use a spreader; just take a shot at the vine and let the leaves spread it in forty-seven directions. I attribute the success of this machine to its large bellows and perfect feeder.

Reedley.

Chas. E. Dailey.

Well Intercropped Orchard.

[Written for Pacific Rural Press.]

Making a small piece of land yield as much gross as a large piece costs more per acre but is likely to total more money in your pocket and less in that of the man to whom you would be paying interest on the larger acreage.

L. M. Hartwick and his partner, Mr. Boulanger, set out about three

and a half acres of walnuts and one and a half of blackcap raspberries in the Van Nuys colony and piped water to it for irrigation from standpipes.

The walnuts were planted about 50 feet apart and the land had to produce something to pay for water and interest. Potatoes yielded ten sacks, onions yielded over three tons, sweet potatoes were planted on ten ridges in one center, Persian and other melons and squashes yielded luxuriantly, strawberries in several centers did well on ten flat rows per center, and a few yellow raspberries and Eastern slip-skin grapes were tucked in.

DON'T ALLOW PRUNES TO LACK WATER.

If a prune orchard dries out in April or May so the fruit suffers, irrigation in June will crack the fruit to pieces, said Mrs. E. McLeod, who lived many years among her Santa Clara prune trees and attended them like children. June watering is all right if the ground has been kept moist.

A winter so dry as the last one is likely to leave the "ground moisture" separated from the surface winter moisture by a layer of dry dirt which ought to be wet by early spring irrigations. The only way to know that the "surface" and "ground moisture" have met is by use of a soil auger or shovel.

SPRAY RED SPIDERS EARLY.

Dry sulphur for red spider on peach trees will work fine if put on as soon as the spiders come; but it doesn't work so well on old spiders (and brown mites) says John Armstrong of Fresno county. He uses a horse power blower to be sure the sulphur gets there with less work and better guidance.

Corn Binder Hastens Ripening Corn

"How to get Indian corn ripe 15 to 20 days earlier and to make a very large percentage of it marketable without being put into the crib at all, is a matter of machinery," said G. R. McLeod of the Sperry Flour Co. at their Corn Day program March 31.

"Last fall, when the ripest corn in a field near Stockton was commencing to get hard and of as deep color as when thoroughly ripe, some of the greenest stalks in the field, the ears of which were just beginning to glaze, were cut and bundled and placed in an open lot to mature. After 25 days, this corn grain was more mature than the ripest of that left standing in the field.

"One of the greatest troubles we have had," said Mr. McLeod, "is that corn delivered in the early part of the season arrives at the mill with a moisture content ranging from 16 to 22 per cent." (E. J. Luke, manager of the Sperry Co., had already pointed out that 15 per cent is about as much as corn can contain without spoiling, and that his company pays on a basis of 15 per cent, deducting from the price if moisture content is higher, and adding to the price if lower).

The K-T Alfalfa System of Irrigation

In spite of the high prices and shortage of all manufacturing materials, we have a full supply of

Irrigation Appliances

on hand at convenient distributing points all over the Pacific Coast, and are prepared to make prompt deliveries throughout the season.

We are the pioneers in this business—equipped to make the best possible goods at a fair price. We make appliances for every kind of irrigation. The advice of our experts is yours for the asking. Write today for our booklet on Irrigation—or for any specific information you may require.

"If the grower allows his corn to stand on the stalk and can market a small proportion of it late in November with 16 to 22 per cent moisture, by harvesting with a corn binder, when the kernels are glazing, he ought to be able to market a large proportion with 15 per cent moisture two weeks earlier.

"The best market would be at the latter end of the old crop in the East, which would be in October, November and December. If you are able to market your corn at this time, you are going to get high prices and do away with a great deal of cribbing and the interest on your investment from that time on.

"A gentleman of Black Station had quite a patch of corn just beginning to glaze late in September or the first of October. It was about 14 feet high and the ears on the corn were completely shaded. He cut the corn when it was in heavy glaze and shocked it. That corn you have seen running through the husker and shredder today (March 31), you see that it is fully matured and has a better color than some of the corn harvested the other way. This corn was planted about the last of June and would not have matured at all if it had not been harvested with a corn binder. Early planted corn begins to glaze pretty well about the middle of September in the Delta and could be cut then."

Tomato Beetles Conquered

[Written for Pacific Rural Press by W. S. Booth, Mountain View.]

Last year I planted a few acres of tomato plants. A week later I found a third of them dead or badly damaged, some by the small darkling ground beetles, Eurymetopon bicolor, which attacks them just below the ground, but mainly by the flea beetles, which eat the leaves, leaving only half a skeleton. For description of these see "Insects of California," published by State Horticultural Commission, Sacramento. This and a pamphlet by the Bean Spray Pump Co. recommended neutral arsenate of lead. I obtained a pound of it and mixed a portion with water at the rate of one pound to thirty gallons of water. I would recommend mixing about ten gallons at a time to keep the solution clean. This amount would be enough for about 3,000 plants. Frequent stirring is necessary, as lead arsenate does not dissolve much better than fine sand. Taking thirty to fifty plants in a bunch, I dipped the tops clear to the roots in the solution just before taking them to the field. Following this treatment, I did not lose one-half of one per cent of my plants from insects, while a Japanese who had several acres near by had to replant more than one-half of his ground because of the small darkling ground beetle.

DAISY FLY KILLER

MELILOTUS FOR RICE LAND.

To the Editor: We wish to determine the practicability of growing Melilotus on adobe soils, well drained. (Rice stubble). We have obtained seed of both the M. alba and the M. officinalis in sufficient quantity for limited experiments. We have grown M. indica on very heavy rice soils in the tropics, but we know nothing about its behavior in the Sacramento valley. Will you give a very brief synopsis of commonly known facts regarding the sweet clover in California, particularly as to the proper season for planting and seed production. A big problem in rice culture is finding a satisfactory legume for culture during the season when rice land is laid over.—H. O. J., Butte City.

If you want a winter grower melitotus indica, planted on well prepared, well drained, non acid soil, at the earliest possible moment after rice harvest is likely to give you a good crop to turn under. So far as we know, no one uses this variety for hay or pasture, since it is bitter. The seed are obtained principally as a by-product of the Sacramento valley grain fields, and the plant grows well on heavy soil. It should get several leaves in fall before cold weather or it will not grow much top until the warmth of spring. Roots, however, are made all winter. Broadcast or drill 20 to 25 pounds per acre. If the soil is sour, apply a ton or two of hydrated or airslacked lime per acre before plowing to get it well mixed with the sour soil.

If you are willing to forego a crop of rice and want to grow a summer legume, melilotus alba, sown 20 to 25 pounds of hulled seed or 25 to 30 pounds of unhulled seed per acre as soon as the ground is warm, will make two cuttings of hay the first season and three or four the second season, if irrigated. Stock soon learn to like it for both pasture and hay, and it does best on moist lowlands, where water is not far away. H. E. Butler plans to grow sweet clover on watergrass-infested land to make the watergrass grow tall enough to cut for hay. Alba does not seed until the second year, when the plants usually die. A hay crop can be cut before allowing it to seed.

FENCES.

The average life of fence posts from the following kinds of wood is: Osage orange, 30 years; locust, 23½; red cedar, 20½; mulberry, 17½; catalpa, 14½; burr oak, 15½; chestnut, 14½; white cedar, 14½; walnut, 11½; white oak, 11½; pine, 11½; tamarack, 10½; cherry, 10 1-3; hemlock, 9; sassafras, 8 9-10; elm, 8¾; ash, 8½; red oak, 7; willow, 6¾.

The average life of a cement fence post is 48 years and a steel post 30 years.

Split the posts as soon as the trees are cut, and give them a chance to season well before using.

Fasten an iron rod about one inch in diameter and two or three feet long, so that it stands firmly upright in a hole in the bench of a mud boat or a log skipper. Slip spool or reel of fencing down over the rod and fasten the end of the reel to the post. Drive the boat down the fence row. Keep your eye out for low places in the fence.

Don't Overwater Alfalfa

If you want to grow the heaviest possible crops of alfalfa, and get the largest money return from the water used, don't apply more than thirty to thirty-six inches of irrigation water a year, under such general conditions as those, for instance, of the loam soils of the Sacramento valley. To apply more than thirty-six inches usually does not produce corresponding increase in yield. Most California alfalfa growers over-irrigate.

Such is the information made available through a report issued by the University of California, covering six years of experiments carried on jointly by the University of California, the California State Department of Engineering, and the Office of Public Roads and Rural Engineering of the United States Department of Agriculture. Copies of their Bulletin No. 3 may be obtained from the University at Berkeley or the State Department of Engineering at Sacramento. Demonstrations will be shown at the University Farm picnic at Davis on Saturday, April 28.

Four applications of seven and a half to nine inches each year are recommended for Sacramento valley alfalfa fields in general, this irrigation to be given immediately after cutting. However, it is pointed out that alfalfa planted on very open or very impervious soils should be irrigated more than once between cuttings.

Soil Auger.—It is urged that the farmer should use a soil auger frequently, to find out whether he is keeping his soil moist enough, and moist deep enough down, to get the best results from his alfalfa. Alfalfa begins to wilt when silt loams contain less than 10 per cent water, and clay loams, 16 per cent. The soil moisture should be kept four to six per cent above the percentage at which wilting occurs. This can be brought about by applying six to nine-tenths of an inch of irrigation water per foot of soil for loam soils, and seven to twelve-tenths inches per foot of soil for heavier clay loams and clays. To apply more than these amounts is not only a waste of water, but threatens positive damage to the crop and permanent damage to the soil.

The reason many farmers apply excessive irrigation is that they have been using too small irrigating heads, or too large checks. Irrigating heads not large enough to enable alfalfa checks to be watered evenly with six acre-inches of water per acre per irrigation are too small, and the remedy is either larger irrigating heads or smaller checks—preferably the latter, especially in the case of the smaller holdings.

These conclusions come from six years of experimenting on the University Farm at Davis, and 40 or 50 other farms near Willows, Gridley, Los Molinos, Orland, Woodland and Dixon.

Beans and Melilotus Among Valencias

[Written for Pacific Rural Press.]

Beans for summer cover crop in ninety acres of Valencias, and melilotus for winter are adding fertility to the soil of the thrifty three-and-a-half-year-old orchard belonging to the Carroll ranch in Orange county. The bean straw is plowed into the heavier soil. Last July the Carrolls sold 610 sacks of 1915 limas at the high price of \$6.35 per 100 pounds, a cash income from the ninety acres of \$3,873, or about \$43 an acre. Some forty or fifty sacks were sold for seed and twenty-three sacks kept for 1916 seed.

"It's good trees we are after," says one of the Carroll brothers, "but the beans not only add fertility and improve texture of the heavier spots, but they help along with the expenses." The trees will be too big next season, however, to grow a cultivated intercrop. They are uniform, vigorous, with large dark green leaves. The bean crop in 1916 was only 295 bags, due to wire worms and fewer rows between trees.

The orchard is set in 24-foot squares. On thirty acres there were in 1915 six rows of beans 33 inches apart, in each center, leaving them four feet from the trees. On sixty

acres there were only four rows. In 1916 there were three rows in part and four in the rest.

The 1915 crop was planted about May 10, using about forty bags of seed. The crop was cultivated twice, irrigated late in July, cultivated, and then laid by, for the vines prevented further cultivation. Meanwhile the oranges were irrigated by furrows outside the beans in the usual way and neither interfered seriously with the other. In September the vines were cut with a sled cutter, dried, and threshed late in the month at a cost of 20 cents per sack for the machine, besides the hauling which brought the cost 10 cents higher. Sacks cost Mr. Carroll 7½ cents each.

Winter Cover Crop: When we visited the Carroll ranch late in September, 1916, they were irrigating by flooding. They expected to spring tooth it both ways three or four days after the irrigation, broadcast melilotus, harrow it in, and then ridge at least one way for irrigation. Unless rain should come early, an irrigation would be given in October; and if desirable to delay plowing in the spring, they would be able to irrigate at any desirable time.

ARRESTING SAND-STORM DAMAGE.

[Written for Pacific Rural Press.]

Strong north winds often do much damage to summer crops in sandy districts early in the spring, when the small plants are just coming out of the ground. To overcome this, E. G. Cross of Manteca finds that

early preparation of the land for such wind storms is effective.

Instead of planking the land after planting to make a solid top surface, he rolls the ground thoroughly and then harrows. This leaves a top mulch with a solid packed foundation and prevents heavy drifting in his tomato fields.

We are undoubtedly facing a great general food shortage. For the sake of the hungry world, as well as that of your bank account, you ought to make every foot of your land as productive as you possibly can. You cannot do this without fertilizing or feeding your soil.

GOLD BEAR FERTILIZERS

BIGGER AND BETTER
CROPS

Address

Fertilizer Department,

WESTERN MEAT COMPANY
San Francisco, California

Why Europe Makes Bigger Crops Than the United States

Average Production of European Crops is as Follows:

Wheat 33 bushels per acre
Oats 45 " "
Potatoes 199.84 " "
Cotton in Egypt, 400 pounds "

Average Production of American Crops is as Follows:

Wheat 14 bushels per acre
Oats 40 " "
Potatoes 97.15 " "
Cotton 185 pounds "

European farmers use about 600 pounds to the acre of a Home-Mixed Nitrated Fertilizer containing 8 per cent of Phosphoric Acid and 4½ per cent of Nitrated or Nitratable Nitrogen.

American farmers apply 200 pounds to the acre of a Fertilizer containing 8 per cent of Phosphoric Acid, together with 2 per cent of Nitrogen which is mostly unavailable.

The difference in results is largely due to the large amount of Nitrated Nitrogen used in Europe per acre as Nitrate of Soda. Our pitifully small American yields are due to failure to appreciate the necessity of using Nitrated Nitrogen.

Write for "What Nitrate Has Done in the Farmer's Own Hands"

Dr. WM. S. MYERS Director Chilean Nitrate Propaganda 25 Madison Ave., New York

Powdered mica is blended into Mica Axle Grease to fill up the invisible roughness natural to all metal surfaces. Results—far better lubrication, and the grease lasts twice as long.

MICA AXLE GREASE

We Must Relieve the Alarming World Food Shortage

(Continued from first page.)

For the armies, grain, beans, onions, potatoes, dried and canned fruits, meat, wool, cotton, etc. To save as much of these as possible for use of the armies, let us use vegetables, fresh fruits, cuts of meat which could not so readily be cured. The armies should have first choice of food stuffs, for they must be kept in condition.

Grain grown for hay may be allowed to mature the grain, which must command high prices anyway. Grain that goes to distilleries and breweries may be saved for food for man and beast; land devoted to hops will grow most anything of greater food value. Ditch banks allowed to grow and spread weeds may produce sheep for wool and mutton.

With Livestock we cannot afford to waste good grain and feed on ill-bred animals that cannot make the best use of it. We cannot afford to waste labor on poor-producing hogs and cows. We can scarce afford to let scrub beef eat up our pastures when purebred sires would make more and better meat from the same pasture.

With field crops we must devise rotations that will keep up fertility, and reduce disease; we cannot afford to plant ill-matured or diseased seed. We need separate plots on which to grow selected grain for seed; we cannot afford to waste good seed on ill-prepared ground. Fallow ground must be intelligently cultivated to make it hold the moisture and make its locked-up fertilizer elements available while the land rests. Better yielding varieties must be sought and tried out judiciously. Seed must be treated to avoid disease where this is possible. Trees must be more persistently sprayed in order to save the other labor put on them. The depth to which irrigation goes, and the distance sideways from furrows to which it soaks, must be learned, usually with soil or post hole augers.

Suggestions for Practice.—Get seed potatoes if possible that are certified by the State to be true to name and free from disease; do not plant any with blackened, rotted, or spotted flesh; treat scabby potato seed with formalin or corrosive sublimate. Treat beans and peas with carbon bisulphide to avoid planting live weevils with them. Do not plant tomatoes where blight has injured a previous crop. Rotate crops to avoid disease. Treat spring and summer sown grain for smut with formalin. Cut out smutted corn stalks and burn them before the

smut sacks burst. When beans come on, sulphur them if red spiders appear. Plant Indian corn for silage wherever it will grow.

Spray apples and pears for codling moth, mildew, scab, etc., at just the time and with just the sprays required. Persist in spraying apples for codling moth. Watch peaches, apples, pears, cherries, prunes, walnuts and plums for aphids, and when you see one spray before they protect themselves with curled leaves and before they have multiplied greatly. Remove borers from apple and stone fruit trees now or sooner with wires. Do not let red spiders damage almonds, citrus fruits, and stone fruits. Give them dry fine sulphur on the first hot day after you find the first of them. Persist with sulphur treatments for grape mildew. Don't let scales overrun citrus, olive, and deciduous fruit and ornamental trees.

Vaccinate hogs and calves with reliable vaccine to prevent loss by disease. Test cattle with tuberculin. Segregate tubercular and abortive cattle; take their calves away and give them commercial feed or the milk of healthy cows immediately. Test all dairy cows to get rid of those which do not produce enough milk or butter fat to pay for their feed and labor. Breed your mares to purebred stallions or jacks. Study feeds and feeding. Raise good poultry and pay attention to it.

Support the University in its costly experiments to gain accurate knowledge to solve farm problems.

Join Your Neighbors in marketing organizations, which will prevent willful destruction of food-stuffs to raise prices, such as has been practiced when chaotic distribution prevailed. Put some of the middlemen out of jobs so they will get into producers' ranks. Get accurate crop reports, both as to condition and total production, on which you can base your plans for the next year's crops. Control the prices and distribution of your crops by co-operation to attain "our first duty," which, according to Mr. Lubin, is "to prevent manipulation of our food supplies" by those whose only interest in the food is in the margin they can skin from it by handling it once more. Get behind your growers' organizations even at temporary sacrifice to yourself, for both patriotism and ultimate profit demand it. Don't stay outside because of poor management of the organizations, but get in and set up a legitimate heller if you have ideas that will improve the management.

Tepary Beans with Poor Cultivation

[Written for Pacific Rural Press.]

Fifteen sacks of tepary beans to the acre without any cultivation was the yield secured by Elbert R. Lindsey on land near Ripon last year. He will plant 200 acres of the same variety of beans early in May.

The land on which Mr. Lindsey grows beans is the sandy loam char-

acteristic of the section. Before planting last year, he plowed the land deep and harrowed it thoroughly before planting. But owing to other work, he was unable to do anything more except to get them hoed three times to rid the land of wild sunflowers.

A part of last year's crop was

planted in April and part in May. Those planted in April made a slower growth, but did not differ materially in yield, although Mr. Lindsey believes May planting preferable. He prefers teparies to black-eyes, because they are earlier maturing, do not shell out so badly nor crack as much in threshing; and he finds that they yield heavier and sell for more money. While he secured good results last year without cultivation, he believes he would

have added a number of sacks to the acre had he cultivated thoroughly and often.

[Tepary seed is scarce this spring on account of the difficulty met last year in marketing tepary crops.—Ed.]

In treating the fence or vine posts with preservative, the posts should be dry, well seasoned and carry no bark. The preservative is applied hot to penetrate better and to kill germs of decay.

General Agricultural Review

GRAINS AND FIELD CROPS.

Misses Jennie and Blanche Lamb, after a year's roughing it on a relinquishment secured by them in Ventura county, are "making good." They have sixty acres of wheat, with a number of fruit trees. Last year they cleared from their property \$1,100; and expect to do better this year.

It is said that, believing that cotton will go to 25 cents per pound for the short staple, Imperial Valley growers are preparing to plant 130,000 acres. Eastern buyers are offering to contract the crop before it is planted at 18 to 20 cents per pound, but planters are refusing to sell.

The Lincoln Cannery Association expected to can 10,000 cases of tomatoes, but now propose to can 20,000 cases, due to frost damage to peaches in the Loomis district.

Warden J. A. Johnston of San Quentin prison advises grain and rice growers to place orders for bags now at 10 cents, to be delivered August to December.

The Texas Bermuda onion crop for 1917 is estimated by U. S. Department of Agriculture at 12,050 acres, an increase of nearly 20 per cent over the 1916 estimate.

James Milligan, a bean grower of Oxnard, has contracted his crop of 1917 limas to be delivered at the maturity of the crop at \$7.25 per hundred pounds.

Reports say that farmers in the Coachella Valley have put out the largest acreage of sweet potatoes ever planted; and that there will also be a big acreage of tomatoes.

A carload of Egyptian cottonseed has been imported to the Bard district of Imperial county for this year's planting.

Beet planting around King City, Monterey county, is practically finished. It includes about 3400 acres.

Unless good, soaking rain comes to Stanislaus county within a week the barley and dry land bean crops will be very small, according to R. M. Frazer. A lot of bean growers are plowing unirrigated land, hoping to catch more rain.

A twelve-year lease on 353 acres of Tyler Island in the San Joaquin delta has been signed for \$107,000 by R. M. Durbin, who will plant it to asparagus. The crop has already been contracted to a cannery.

J. E. Bennett of Turlock says he cut seventy tons of oat hay from ten acres last year and followed it on the same ground with 150 tons of silage. He figures his silo paid for itself in one year.

News comes from Fullerton that cabbage growers in that section are reaping a rich harvest. It is said that shippers are paying \$85 to \$90 per ton.

It is reported that Mayor H. E. Hyde of Marysville offered \$1 prize for the largest potato and got three sacks of entries valued at over \$12.

Turlock cantaloupe acreage is being reduced for fear of difficulties of transportation and because more concentrated food is needed.

Canners are buying surplus asparagus in the San Francisco market at five and six cents per pound. Retailers were paying seven cents for better grades.

A fire at Vladivostok, Siberia, destroyed 50,000 bales of cotton last week valued at \$10,000,000.

First crop Stanislaus alfalfa is about two weeks late on account of the cold winter.

New potatoes are commanding nine and ten cents per pound in San Francisco.

Alameda county green peas have been selling at eight cents per pound.

There are nearly 4000 acres of cantaloupes in Imperial county this year.

Grain hay in Stanislaus county is selling at \$30 and alfalfa at \$25.

May wheat in Chicago has gone above two dollars per bushel.

California rice has been going to Honolulu and Buenos Ayres.

A. Biggs, rice grower, has refused \$2.50 for paddy.

CITRUS AND SEMITROPICAL.

The three packing houses of the Escondido Valley, it is said, are paying out \$1,800 per week in picking and packing citrus fruit. Growers report fairly satisfactory prices for both oranges and lemons. A total of 123 cars or about thirty per cent of the crop has been packed, fifty-eight cars of oranges and sixty-five cars of lemons.

May 1 is the final day when all the money and time and work and news space will have been wasted unless enough prune and apricot growers sign up with the Association. Every member gets all his crop sells for except the smallest kind of a charge for Association expenses.

The earliest caprifigs found by Prof. I. J. Condit in San Joaquin Valley were recently located in Merced county. He recommends for trial the pseudo-carica caprifig, which has proved so successful on the first Smyrna crop in Imperial county.

If a tree is found to be infected with citrus canker the wisest course to pursue is to burn it at once. This method of eradication is used throughout the affected region of the South.—U. S. Dept. of Agr.

When plants are shipped from one county to another, a copy of the invoice should be sent to the horticultural commissioner, where the plants are received, not to the county commissioner where the consignee resides.

It is announced from Riverside that eight orange packing houses in that city will close down as soon as the present supply of citrus fruit is packed, owing to a strike by the packers.

A new species of codling moth infests the persimmon in Japan, but Horticultural Quarantine Officer Frederick Maskew is on guard to prevent its introduction to California.

Santa Cruz County Horticultural Commissioner W. H. Volck says that the dry spring reduces chance of damage by apple scab, especially in the valley orchards.

The Whittier Citrus Association closed its navel season last week. Its business for the past six months totalled \$470,000, an increase of \$155,000 over the same time last year.

The Santa Clara apricot crop is very spotted, some places having a fine crop, others practically none.

Banning apricots have been selling at fifty dollars per ton to canners.

Plant Your POTATO Land When Crop is off to

RHUBARB

If planted then you can expect BIG PROFITS by fall or early winter. OTHERS MAKING \$1,000 PER ACRE ANNUALLY—SO CAN YOU. Don't put it off any longer. April-May-June positively best months to plant. WRITE

J. B. WAGNER

"Rhubarb Specialist" CALIF. PASADENA,

Save Expense and Trouble

It means a lot more than the purchase price to the man who buys an unreliable pumping engine. The time, worry and expense involved trying to get the engine to run right must be added to the first cost. And finally, more time and expense with your pumping plant out of commission while the engine is being changed for another.

Get the Right Engine First

Install a Commercial Engine and you will have no trouble or needless expense ahead of you. Write today for our handsome new catalog and post yourself on all the superior features of Commercial Engine construction. Remember; an ironclad written guarantee protects the purchaser of every Commercial Engine.

WHAT ABOUT YOUR IRRIGATION PIPE?

Owing to conditions existing in the Iron market and also to weather conditions, we suggest you order early

AMES IRVIN IRRIGATED PIPE.

We have a complete stock, and can make immediate delivery. AMES IRVIN PIPE is solid and strong, with no holes in steel. Each sheet is edged-locked together, and then set down under 3500 pounds pressure. Such seams will not break or leak. Send for booklet giving complete information about Irrigation Pipe and its construction. Get it today.

AMES IRVIN COMPANY

8th and Irwin Street,

San Francisco

Lock Seamed and Soldered

There is a tremendous difference in surface pipe. This is appreciated most by the man who has wasted time and money on inferior makes. If you want absolutely the strongest and best surface pipe you can buy, select

Madewell Surface Pipe

It has many distinctive important advantages you can't afford to overlook. The Madewell Long Lock Seam is made doubly sure and strong by soldering the entire length. A better seam can't be made. The Madewell Lock Seam Sleeve—used in Madewell pipe only—is decidedly stronger and smoother than the old fashioned lap and riveted seam used in other pipe. This feature alone puts Madewell Pipe in a class by itself.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

HONEY NOTES.

Hess Elkins, one of the biggest honey producers in the Fillmore district, has sold his 1917 honey crop at nine cents per pound. It is said his crop will yield him several thousand dollars.

Secretary Richter of the California Bee Keepers' Association, writing to the Western Honey Bee, says: "There is a San Francisco buyer here (Stanislaus county) trying to contract our white honey (extracted) at six and a half cents per pound; light amber, six cents; amber, five cents, for the coming season. This man recommends arbitration should there be any differences over standardization."

The Western Honey Bee says: "Our opinion as to the standard of color for honey has never changed. We should be our own arbiters. If the directors of the State Association will prepare two chemical samples and say, 'this is light amber' and 'this is amber' and put their seal to it, the thing is done. Every buyer in the State will respect it, because it will be the first step toward uniformity, which they need as badly as we do."

It is just between seasons. Old stocks are exhausted and it is too early as yet for the new crop. One of the largest Los Angeles buyers has just returned from a two weeks' trip among the honey producers of Southern California. He says he found the season very backward. No extracting has been done as yet. With a good shower the next two weeks the indications are that the crop will be a very good one. Without rain, however, the yield of honey will be short. So far no prices have been named for new honey, though the prevailing impression is that it will rule higher than last year. The market will be late in opening.

News comes from Santa Ana that the long dry spell has dried up the annual flowers, especially the wild heliotrope and the dandelion; hence it is thought the honey crop of Orange county will be pretty much a failure.

GRAPES AND SMALL FRUITS.

James Madison was not re-elected manager of the California Associated Raisin Company.

The California Associated Raisin Company has named opening prices for the 1917 crop of layer and cluster raisins three-quarters of a cent higher than 1916 opening prices, but the same as prices set after the rains last year. Thus does this growers association show that co-operation does not raise the price to consumer, though it does raise the price to producer.

MISCELLANEOUS.

D. O. Lively Stock Farm reports the recent sale of twelve young mares to the Hawaiian Islands; Holstein cow to Mexico; two Jersey cows to J. V. De Laveaga; a Ring Master Shorthorn bull to the Rodgers Ranch Company at Lovelock, Nevada; ten Duroc Jersey sows and a boar to Major Brooks; twenty-eight Flemish Giant hares to the Whitehall Ranch at St. Helena. They also report the receipt of twenty registered Hampshire ewes and a ram from Illinois.

Approved grazing allowances for the National Forests during the coming season provide for the pasturing of 8,400,155 sheep, 2,120,145 cattle and horses, and 54,680 swine.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

TRUCKS INSTEAD OF AUTOS FOR TRUCKING.

"What a certain small car is to the pleasure car industry the light truck will be to the commercial car," says G. Edgar Busch of Santa Rosa.

"When I say a 'light truck,'" he continued, "I mean a sturdy strong vehicle especially built for trucking purposes, not a pleasure car made over into a truck by putting a truck body on it; nor yet a pleasure machine of the five-seat type with the back taken off and a receptacle for parcels placed thereon. The day of this feeble compromise is about over. Users are finding that the pleasure car chassis is altogether too light to stand the racking strains of delivery work. Besides, every now and then, when a little extra load has to be carried, the pleasure machine cannot get away with it. The cars are geared at $2\frac{1}{2}$ to 4 to 1, while industrial vehicles properly designed run from $4\frac{1}{2}$ to $6\frac{1}{2}$ to 1, power may be there all right, but the machine being built for high speeds with a light load cannot get away with the heavy load. Pleasure or even lower.

"The Vim half-ton truck, for instance, is geared at $4\frac{1}{2}$ to 1. With this gear it can run up to 30 miles an hour if pushed, and yet can climb any hill with its load on the low gear.

"The chief point that I would like to make, however, is that for real lasting service in delivery work, a machine must be designed as a truck, and built as a truck, from engine to back axle."

DYNAMITE.

Don't use a smaller cap than number six.

Don't keep dynamite too long. It deteriorates.

Don't jam the cap on the fuse.

Don't try to draw a misfired charge from a hole. Shoot another off alongside of it.

Don't thaw dynamite by putting it in hot water or before an open fire.

Don't cut the fuse with dull tools.

Don't crimp on the caps with

Don't have anything except a watertight connection in wet work. Smear the joint with laundry soap, tallow or axle grease.

PLOWS WITH A THIRD LESS POWER.

[Written for Pacific Rural Press.]

Improvements can be made in mold-board plows to do better work with less power. A case was recently observed where the power required was reduced about one-third on a 16-inch plow, operated by R. M. Frazer of Stanislaus County.

There is no land side to the plow. Instead, a solid sheet metal wheel about a foot in diameter is fastened so that it not only bears the downpush of the plow, but also rolls against the land side of the

furrow to keep the plow in line. How much difference in friction on the bottom of the furrow there is, was shown by hooking a rod into the wheel and letting it drag. But the advantage of doing away with much of the side friction of the ordinary long wide landside of a plow is even greater. In this plow, the wheel is fastened securely, right under the curve of the mold-board so that in plowing crosswise of ridges, it follows the contour of the ground very nearly the same as the point, not lifting the point out of ground when the wheel passes over the ridge as it would if the wheel were back still further.

POWER FOR SMALL PUMP.

To the Editor: I have a centrifugal pump, $2\frac{1}{2}$ inches suction and two-inch discharge. Twenty feet to water. I wish to force to water into a tank 30 feet high. What size electric motor will it require? Would it require less power if I put a $2\frac{1}{2}$ inch pipe above the two-inch discharge?—J. A. M., Wheatland.

[Answered by Prof. J. B. Davidson, University Farm, Davis.]

There is one factor missing in connection with the problem set forth in the above pump installation. That is, the length of pipe through which the water must be pumped. This is needed in order to determine the friction loss in the pipe. If we assume that there is a 20-foot loss of head due to friction in the pipe making a total lift of 70 feet, we find upon referring to a table of power requirements for a pump manufactured by a prominent firm that a No. 2 pump discharging 120 gallons per minute will require 6.3 actual horse power. To guide the correspondent in connection with the last phase of the question will say that the loss of head with a flow of 120 gallons per minute in a two-inch pipe is 36 feet per 100 feet, while in a $2\frac{1}{2}$ inch pipe it is only 12 feet per 100 feet of length.

CHEAP FEED GRINDING.

[Written for Pacific Rural Press.]

By having a five-ton feed grinder and a twenty-five horse power electric motor, the New England-California Corporation are able to grind all of the grain fed on their ranch, for a dollar a ton. As a part of the 1500 head of hogs fed on the ranch are getting some grain all of the time, the saving runs into many hundreds of dollars each year.

They have the grinder set in a large barn, where there is ample room for the storage of grain and plenty of room for the two workmen who operate the grinder to move about. Early in the spring

1 Row Beet Plow

KILLEFER
QUALITY

KILLEFER
EFFICIENCY

The strongest one row beet plow on the market. It will stay in the ground and get all of the beets; is easy to guide, and the compound lever makes it easy to lift. The shifting hitch is simple and strong. Get your orders in early, as the price on all grades of steel is advancing, and there must be further advances in the price of implements. We build two and four row plows for tractor use.

Our guarantee of quality and work goes with any of these implements; don't experiment; buy guaranteed tools; it costs you less at the end of the season.

LAYNE & BOWLER

Pumps

High-priced Crops Assured

Your crops are going to sell at top-notch prices this year. There is every indication that this will be the most prosperous year for ranchers in the history of the country. Are you well prepared to produce your BIGGEST crop? Are your irrigation facilities what they should be? An inadequate system may cause the failure of your crops. Don't take chances. Install the Layne & Bowler Pump and be absolutely assured of plenty of water all the time at the lowest cost. Our Catalog No. 25 is yours for the asking.

GASOLINE ENGINES

Inquire of your local Dealer for full particulars.

power was being furnished by a motor that is used during the irrigation season to pump water for the ranch from the river.

ELECTRIC MOTOR HINTS.

Install the motor on a level. This saves repairs.

Don't allow tools or metals to come in contact with live parts of the motor.

Don't attempt to make adjustments on the motor while running.

Don't fail to inspect the motor before running to ascertain the possible presence of foreign matter in proximity to the running parts.

Don't neglect to clean brushes and commutator if sparking is observed. Also insure a proper tension on the brushes. If this does not stop the sparking, shift the brushes backward and forward until a point is found where the sparking ceases. Don't allow moisture to reach any part of the motor.

Don't allow dust to accumulate on the interior. It may cause overheating, and short circuiting.

Change the oil at intervals, to prevent ruined bearings.

Don't turn the full power into the motor at once if a rheostat or controller is used. This causes excessive heating, strains bolts and machinery and consumes an abnormal amount of starting current.

Don't leave the switch in if the motor will not start. Open the switch and investigate.

STOPPING RESERVOIR LEAKS.

[Written for Pacific Rural Press.]

Irrigation reservoirs in sandy land are often unsatisfactory because of excessive leakage. Crude oil is sometimes an effective cure; but even that will not always stop the leakage.

After all other attempts had failed on a ranch in the San Joaquin Valley, the owner planted grain in the bottom of his reservoir and kept it good and wet. When it got up good he turned a bunch of sheep in it and in eating the feed they did such a thorough job of soil packing that all seepage was overcome. Another reservoir owner used hogs in the same manner.

GASOLINE PRECAUTIONS.

Do not bring or allow exposed gasoline or anything covered with gasoline in a room where there is a lighted stove or lamp.

Use care in rubbing any article soaked in gasoline or in cleaning with gasoline. The friction may cause a spark that will ignite the gasoline.

If gasoline stoves are used, the smell of gasoline should be a danger signal and all fires should be put out at once and not relighted until the trouble has been remedied.

Never put gasoline in a can unless such can is painted red and plainly marked gasoline.

WHY YOU SHOULD USE CONCRETE.

It is easily made sanitary and kept so.

It is always cheaper in the end.

It utilizes home labor and materials.

It takes no paint or repairs.

It is wind and earthquake proof.

It is warmer in winter and cooler in summer.

It can be made fireproof.

POWER NOTES.

A 20-passenger automobile with flanged wheels is to do rapid transit work on the V. & T. Railway in Carson Valley, Nev.

The main point in trying to avoid pinching the inner tube of an automobile tire is to make sure that the valve stem is pushed back as far as possible when applying the casing to the rim, according to a Fisk Rubber Co. official.

Six tractors are plowing a tract of several thousand acres for a rice and bean project near Gridley.

A bushel of "alcohol" potatoes are said to produce about 18 quarts of 160 to 180 proof alcohol, which Henry Ford says is best in motor cars and tractors. The day of alcohol fuel in the United States is approaching, according to Mr. Ford.

The manager of the Belgian Government factory says that American machinery is practically alone in the field on fine automatic work, replacing the dexterity of hand work.

DEEP WELL TURBINES

No valves to pack or plunger to get out of order. For use in any well ten inches in diameter or over.

A complete line of irrigating pumps of all descriptions, horizontal, and vertical for belt drive or direct connection to electric motor.

Prices as low as are consistent with good quality and workmanship.

Pioneer Breeder Gone

[Data supplied by Wm. A. French, Stockton.]

The man who made Kings county the cradle of the Poland-China in

Elias Gallup, Hanford.

California has passed on. Elias Gallup bred Poland-Chinas before he came there in 1876. In 1879 he made the first exhibit of Poland-Chinas at the State Fair. In 1880 he became a charter member of the American Poland-China Record Co. by purchase of the first share sold west of the Rockies. Several years he judged Poland-Chinas at the State Fair. He was the first man to register a Poland-China from California. He must have been glad recently to see organized in his home town the State Poland-China Breeders' Association. He must have been proud these past years to see the name his county has made for breeding champion Poland-Chinas.

Mr. Gallup was also a purebred sheep and dairy cow breeder, besides special interest in fancy poultry.

Good Stock Rations

When the cow is giving a large quantity of milk, supply nearly one-half of the protein, carbohydrates and fat required in the grain part of the ration, except in cases of forced production when a somewhat larger percentage of concentrates may be profitably used.

To be economical a considerable part of the ration must be of a succulent nature.

Where feed is rather scarce it will be advisable to plant soiling crops for cows.

Sorghum and corn are the surest and best crops for soiling purposes.

If feed is short, sell part of the herd and give those remaining full rations.

In calculating a cow's feed, figure on one pound of grain to every two and one-half to three pounds of milk produced, and all the roughage she will eat.

The ration for a beef steer for one day is about 20 pounds of dry matter per 1,000 pounds live-weight. This should contain about 16 pounds of digestible matter, 1.25 to 1.75 of which is digestible protein. Under average conditions 100 pounds of grain should be obtained from 150 pounds stover, or about the same of silage, 325 pounds of hay, 775 pounds of corn and 75 pounds cottonseed meal.

WEIGHT OF SILAGE AT VARIOUS DEPTHS.

To the Editor: How much does a cubic foot of silage weigh at different heights in the silo, after it has settled?—G. R. C., Escondido.

We reprint figures taken from Wisconsin Bulletin 59, showing the weight per cubic foot at different distances below the surface two days after filling; also the total weight per square foot of the column of silage above various depths:

Feet below top surface of silage.	Weight per cubic foot of silage at different depths—lbs.	Total weight one square foot area to depth given—lbs.

SUDAN GRASS PASTURE.

[Written for Pacific Rural Press.]

Sudan grass on light, sandy, irrigated land made excellent pasture for both the Guernsey cattle and Berkshire hogs on A. B. Humphrey's ranch at Escalon last year.

The Sudan was drilled in as soon as frost danger was over; but this year it will be broadcasted, so the stems will not grow so coarse, and it will make better pasture. Chas. Maurer, superintendent of the livestock department of the ranch, says that both brood sows and young pigs did fine on it last year when fed a little rolled barley. When irrigated, the yields are considerably heavier than when dry-farmed.

WHEAT, BARLEY, AND SILAGE FOR SHEEP.

To the Editor: How many sheep can I feed on the wheat one cow consumes in one year? Also, will sheep do well on barley straw and corn silage?—E. Z. S., Escondido.

[Answered by Prof. R. F. Miller, University Farm, Davis.]

It is very difficult to make any statement regarding the pounds of wheat that may be consumed by either a cow or sheep per year, as this would depend entirely on specific conditions. However, we usually figure five to six mature ewes equal to one cow.

Sheep are not especially adapted to such coarse roughage as barley straw, and we seldom see a flock of

Saves Time!

The faster you turn the Sharples, the quicker you finish skimming! For instance: If by turning a Sharples at 45 revolutions per minute you get through separating in 15 minutes, you can get through in 10 minutes by simply increasing the speed to about 55 revolutions. The Sharples is the *only* separator that can be "hurried"—a mighty handy thing when you are hurried.

Now consider the time saved in cleaning the Sharples. The bowl is the most simple in existence—just *one* piece in it, no discs or blades. Simply run a brush through it once or twice—and cleaning's done!

Furthermore, the Sharples requires oiling only *once* a month—and in only *one* place. Just pour a little oil into the enclosed gear case—more time saved!

SHARPLES

Famous Suction-feed
"Skims clean at any Speed"

SEPARATOR

- the *only* separator that skims clean at widely-varying speeds
- the *only* separator that delivers cream of unvarying thickness—all speeds
- the *only* separator that you can turn faster and finish skimming quicker
- the *only* separator with just one piece in the bowl—no discs, easiest to clean
- the *only* separator with knee-low supply tank and a once-a-month oiling system

Remember that all separators lose considerable cream when turned below speed—*except Sharples!* The Sharples gets all the cream no matter whether you turn it fast or slow. It saves up to \$100 a year more than other separators. Cordially welcomed by women, owing to its easy turning and easy cleaning. Over a million Sharples users. Write for catalog to Department 31.

BAKER'S TRACELESS HARNESS

Best plow rig. **NO WHIFFLETREES—NO TRACES.** Handiest farm harness. Indispensable in the orchard with special fitness for all low down work. You can hitch closer to your load, plow and cultivate close to the row and save all the worry to man and team. No weight of whiffletrees for man to lug. Everything clear behind team. Use our outfit and save your trees. Highest endorsement of farmers and fruit growers. Write now. **B. F. BAKER CO., NUMBER 1220 MAIN ST., BURNETT HILLS, N. Y.**

sheep hovering around a straw stack as is so common with hogs. However, in feeding corn silage, some straw could be utilized to good advantage (preferably oat straw), as this is free from beards and more relished by stock. At the University Farm the sheep are wintered on corn silage and alfalfa hay, which we find a very satisfactory ration.

Let the boy practice on the cows that are being dried off.

The manure should be removed daily and the manger kept clean.

The Farmer's Duty to the Nation!

IN THE PRESENT situation, clearly the farmer's duty to Our Nation is that he produce foodstuff in the largest quantities possible—that he use every means available to conserve this food supply. Also, his duty to himself certainly demands that he produce his own needs as economically, and on as little ground, as possible, so he may have a maximum amount of farm products to sell at prevailing high prices, thereby securing greater profits from his labor.

Never was the need for a silo more apparent than under present conditions. Silage crops, on account of their greater tonnage, enable the farmer to produce his own feed on a comparatively small amount of ground, and very cheaply. Thus he has more ground to devote to crops for the market—crops that mutually benefit himself and his country. Silage, being a succulent feed, helps secure increased results from dairy herds and beef stock, adding more foodstuff of this kind to our national surplus.

Any GOOD silo will more than pay for itself every year in the hay and grain its use will save. The—

INDIANA SILO

is a GOOD silo, as is shown by the splendid record it has made the past **FOURTEEN YEARS** on over 60,000 American farms, a record that has proven the methods and materials used in its construction to be right. Add to this the fact that it is fully covered by the Spaulding Guarantee—backed by our great resources—and you will realize your money invested in an Indiana Silo, known and used in every State in the Union, must be better invested than it could be in one of the unproven types found everywhere.

The Indiana Silo is within **YOUR** reach, for our service covers the entire Pacific Coast. Our terms will permit you to pay for your silo out of the money it saves for you, and Indiana Silo Service will enable you to get results without experimenting. A postal sent us will bring our silo book—just off the press—and complete information in regard to prices and terms; it will also be your first step toward greater profits from your farm, and the production of greater food supplies for our country. Won't you take this step today? Thankyou.

Succulent Feed the Year Round

[Written for Pacific Rural Press.]

Whenever one finds heavy producing herds of dairy cattle he also finds as a rule a good feeder. This rule holds true with John Guill of Chico, whose grade Holsteins averaged 10,170 pounds of milk and 346 pounds of butter-fat in the Gridley Cow Testing Association last year.

The importance of succulent feed, which has at various times been emphasized in these columns, is well brought out in Mr. Guill's feeding operations. While alfalfa hay is the basic ration during the entire year, succulent feeds are also provided during most of the time. Silage with Mr. Guill is no new fangled idea, his first silo having been erected in 1897; and another one soon afterward. One of these is no longer used; but the other one has been relined with building paper and resaw and still preserves the silage in a satisfactory manner.

Indian corn is the principal silage crop, being planted as soon after April 1 as possible. Leaming Yellow Dent is the variety used, the yield on unirrigated land averaging about 10 tons to the acre. By August 1 the corn is ready to silo, but before that time a few loads are cut and fed green to the cows. As soon as the silo is filled, silage feeding is begun, 30 pounds per head per day being the usual amount fed in the barn together with what alfalfa hay the cows will clean up in the corral.

During the time the corn has been growing, another later crop of silage is also under way, a patch of milo always being grown for this purpose. This is not ordinarily ripe enough to silo till the latter part of September or the first of October. By that time, the corn silage has

been fed out to a considerable amount and there is room in the silo for a good deal of milo. This is added in a sufficient amount to again fill the silo, care being exercised against siloing the milo before it is well ripened. Mr. Guill explains that while it takes the cows a day or two to get accustomed to the change from Indian corn to milo silage they do as well on one as on the other in a short time.

Even with Mr. Guill's extra precautions, his silage supply begins to run low early in the spring. For succulent feed in February, March and April he plants a field to rye each October. On new land, it is necessary to give the field a full seeding, but the next year it is allowed to volunteer with a little additional seed harrowed in. The rye field furnishes a good safe pasture for the cows; and when the season is favorable and the growth rank, it is sometimes cut green and fed to the cattle in the corrals. It is an inexpensive crop to grow and provides green feed till well along in the summer, without danger of bloat.

Being an advocate of good feeding practices, Mr. Guill naturally realizes the importance of good alfalfa hay, believing that good alfalfa can be seriously damaged in the hay making process. He cuts his alfalfa just as it is beginning to blossom and puts it into the shock before it has had time to dry out badly on the ground. By this method the greater portion of his hay cures in the shade. By putting into the barn while there is still considerable moisture in it, the loss of leaves is reduced to the minimum; and it is much more palatable to the cattle.

Mixing Barley and Alfalfa Hay for Cows

[Written for Pacific Rural Press.]

While some barley has been advocated for the dairy cow ration in connection with alfalfa hay and silage or beet pulp, it has probably been seldom furnished in the way that A. J. Morey of Orland fed it to his dairy cows the past winter. Ordinarily Mr. Morey depends upon alfalfa hay as the sole roughage for his cows; but last fall he had a small lot of barley hay which he mixed with his alfalfa in the proportion of about two parts alfalfa to one part barley hay. In feeding this mixed hay ration the past winter, together with about one pound of dried beet pulp to every four or five pounds of milk a cow produced, he has had surprisingly

good results; and in the future he expects to continue mixing the two varieties of hay in the barn.

Another benefit which results from the use of barley hay in the dairy ration on Mr. Morey's 20-acre ranch, is its adaptability as a rotation crop. With Mr. Morey rotation of crops is an important factor, as with all alfalfa farmers; but because of his small acreage, it is difficult to rotate and at the same time provide sufficient feed for his herd. With the barley hay followed by a crop of corn for silage, Mr. Morey believes he can solve his problem in this regard and expects to erect a small silo the coming year on that account.

SAVES LABOR FEEDING CHOPPED FEED.

[Written for Pacific Rural Press.]

The awkward way some people have of handling silage and chopped hay when feeding to cows, makes them complain of the high cost of labor because they make that labor inefficient. S. J. Smith of Stanislaus County wastes no labor in this respect. The hay barn is separated from the milking barn by only an alley. A wooden track four feet wide runs from under the chopped-hay storage straight through the

center of the cow barn where two lines of cows face the center alley, which is very little wider between mangers than the car. At the other end of the cow barn the track runs straight to the silo, so the car can be run directly under the chute. The car is 4 feet deep, 4½ wide, and 8 feet long, holding a day's silage feed for 72 cows per load. In the morning after cows are turned out, the silage is distributed, and then chopped hay put on top.

It is all important that the cow relish her feed. Feed her both roughage and concentrates.

Borrow Money at 6 per cent and make 30 per cent with an IDEAL GREEN FEED SILO

Now is the time to place your order for an IDEAL GREEN FEED SILO. Put that first crop of alfalfa into it. It won't make good hay, but the alfalfa, foptail and weeds will make excellent silage. Have silage to feed this summer when green feed is gone. You can thus increase your milk profits 25 per cent and reduce feeding costs 15 to 20 per cent during the coming dry season. The silo will be empty in time to fill with corn this fall for winter feeding.

Refrigerator Type Doors; Air and Water Tight Foundation Joint; Proper Design; Selected Materials and Painsstaking Workmanship make the Ideal Green Feed Silo a Safe, Profitable Investment for the Dairyman or Stock Raiser. Send for Catalog.

Selling Cows on Testing Records.

[Written for Pacific Rural Press.]

If anyone has any doubt of the benefits of cow-testing associations they should have talked with A. J. Morey of Orland, Glenn County, early in March of the present year, at which time he had just sold four grade Jersey cows for \$150 each.

Two years previous to that time Mr. Morey had paid a good long price for these same four cows himself, having purchased them from N. H. Locke in San Joaquin County because of the high yearly production they had made in the San Joaquin County Cow Testing Association.

During the two years Mr. Morey had them they each made approximately 400 pounds of fat a year and it was this fact that resulted in the high price received for them.

"All I did was to set a price on the pick of my herd and turn the testing book over to the buyers. They selected them on the records, and while they were the best cows I had, I have heifers from all of them that will be freshening next fall. Naturally I hated to part with them and had to get a good price, but I consider them cheap cows to the buyer just the same."

When Mr. Morey started dairying a few years ago on his 20-acre ranch, he picked up the best looking grade cows that he could find in the district; but discovered through private milk weighing and testing that his herd average was only about 250 pounds of fat a year. At that time

there was no cow-testing association in his district.

Deciding that a 250-pound cow was not good enough, he sold the lot and purchased a smaller number of higher producing cows. He bred these to as good a bull as he could get; and as soon as the Glenn County Cow Testing Association was started he entered his entire herd. Besides increasing the value of his good cows, as shown above, he has weeded out his poor ones, with the result that his herd average is now better than 315 pounds in a ten-month lactation period.

While he could have weeded out the poor cows just as well with his own weights and tests he realizes that such records are not given the consideration that those of a disinterested tester are. By making use of testing records in both his buying and selling, Mr. Morey has been enabled to buy a number of purebred heifers, expecting ultimately to have nothing but purebreds.

MENDOCINO STOCKMEN ORGANIZE.

[Written for Pacific Rural Press.]

About sixty of the prominent stock raisers of Mendocino county met at Ukiah last Saturday and organized the Mendocino Stock Raisers' Association by adopting the by-laws of the Humboldt Stockmen's Association with but few changes.

The primary object is to prevent stealing; and Secretary T. B. Hicks stated that coyotes, sheep-killing dogs, and trespassing would come in for consideration.

C. E. Robertson, organizer of the Humboldt Stockmen's Association, explained the objects of the meeting and spoke of the benefits that the peach growers, raisin growers and the musco ranches had received by co-operation in selling their respective products.

District Attorney Hale McCowan stated how hard it is to get the necessary evidence to convict stock thieves.

J. D. Coffman, of the Forest Service, made an address, and his suggestion that the association pass a resolution in regard to ground squirrels and coyotes was adopted.

Most of the members present handed in a list of their marks and brands to the secretary; and it is the intention later to have all the members' marks and brands compiled in book form and a copy given to each member to make it easier to trace each other's stock when they stray from their own range. About 45 per cent of the range stock of the county is already enrolled.

ALFALFA AND COCOANUT.

To the Editor: How much alfalfa meal can be fed to a milk cow when only alfalfa and cocoanut meal is used in connection with hay.—A. C. C., Hayward.

[Answered by G. A. Brown, El Monte.]

If you are feeding grain hay, 20 pounds daily of alfalfa meal could be fed to good advantage. Soak 12 hours and mix the cocoanut meal with it at time of feeding. I use chop to lighten the beet pulp and cottonseed meal, which I feed together, and to make them more digestible.

The Supremacy of the NEW DE LAVAL

THERE may be some question as to who makes the best wagon or the best plow or the best watch, but when it comes to cream separators the supremacy of the De Laval is acknowledged at once by every fair minded and impartial man who is familiar with the cream separator situation.

Thousands and thousands of tests, the world over, have proven that the De Laval skims the cleanest.

The construction of the New De Laval keeps it in a class by itself.

It outlasts and outwears all other makes by far, and can be run with much less cost for repairs.

The world-wide De Laval organization, with agents and representatives in almost every locality where cows are milked, ready to serve you, insures that the buyer of a De Laval will get quick and valuable service when he needs it.

More De Laval's are sold every year than all other makes combined.

The New De Laval has greater capacity than the 1916 style, is simpler in construction, has fewer and interchangeable discs, is easier to wash, and the skimming efficiency is even greater.

Each New De Laval is equipped with a Bell Speed Indicator.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or if you don't know him, write to the nearest De Laval office as below.

New Catalog will be mailed upon request

DAIRYING.

The Willowwood herd of 60 registered Jerseys, owned by C. G. McFarland, Tulare, is to be dispersed at public sale, May 17. Mr. McFarland recently sold his place near Tulare and bought 160 acres near Waukena. He has for several years kept up regular Register of Merit test work, and has a fine, high-producing herd. The sale will be under the management of California Breeders Sales and Pedigree Company, and Colonel Ben A. Rhoades will be auctioneer.

The Merced County Cow Testing Association was organized late in March.

The Holstein Friesian Association of America offers a trophy or silver cup for the best herd of registered Holsteins at the Butte County Spring Exposition; and 15 per cent cash on the general classification at the State Fair. The first prize winner in the State Fair butter-fat contest will get a trophy or silver cup if a registered Holstein.

On April 1, 1916, the average production of the ten highest cows in the aged class (five years or over) of Guernseys was 18193.4 pounds of milk and 948.98 pounds of butter fat. On April 1 of this year the production of the ten highest cows in the same class is 19056.8 pounds of milk and 976.15 pounds of fat, showing an increase of 863.4 pounds of milk and 27.17 pounds of fat. During the year there has been an increase of 300 records in class A with an increase in fat of 6.27 pounds.

A new world's champion junior four-year Holstein is Wandermere Belle Hengerveld, owned in Michigan. Her record is 42.64 pounds butter from 570 pounds milk in a week.

De Lancy Lewis of San Jose reports three good records for three-year Holsteins: Tulista Johanna Princess, 27.90; Finderne Soldene Fayne Korndyke, 21.25; Miss Wayne of Yuba, 25.33. The Tulista heifer was taken direct from pasture for the test. She produced 98.1 pounds milk in a day and over 100 pounds of butter in the month. She freshened with twin heifers.

E. R. Frey of Byron, who has bred pure-bred Guernsey cattle for a number of years on a small scale, is contemplating the enlargement of his herd.

The Bridgeford Company of Knightsen expect to consign twelve

of their choice registered Holsteins to the Holstein sale to be held at the University Farm at Davis the first week in June. Among the lot will be a two-year heifer, whose four nearest dams average 34 pounds and a yearling heifer out of a 29-pound cow and sired by a 30-pound bull. All of their female offering will be bred to their senior herd sire, King Segis Pontiac Alcartra Abbeckerke.

McAlister & Sons of Chino report the record of K. P. Tola, junior four-year daughter of King of the Pontiacs: 26.94 pounds butter in seven days and 108.64 pounds in thirty days.

Gotshall and Magruder of Ripon have had enough confidence in the pure bred dairy business to establish a herd of registered Holsteins and develop one of the most modern dairy ranches in the southern part of San Joaquin county. During 1916 this firm purchased foundation cows at most of the Holstein sales, selecting animals carrying the blood of King Segis and of King of the Pontiacs whenever possible, they being mostly A. R. O. cows. For a herd sire they purchased King Pontiac Ormsby Segis, by King Pontiac Netherlands Segis and out of Cristeria Overton Mechthilde Fourth, with a record of 31.70 pounds butter and 463 pounds milk. The herd now numbers 35 head, but this will be increased to 100 head.

C. H. Geer of Modesto has completed his third 250-ton silo this season. He finds corn silage and alfalfa a fine ration for the 210 cows he is milking.

The Humboldt County Dairymen's Association is resisting the proposition of buyers of dairy stock for beef, to consider the loss in butchering 54 per cent instead of 50 per cent.

Guy H. Miller of Modesto reports sale of the registered Jersey bull Juanita's Interested Fox, first prize as a junior calf at Sacramento last year and out of the cow Juanita of Venadera, rst in Register of Merit class at 1916 State Fair, to J. H. Holgate of Turlock. He has also recently sold bulls to parties in Winton, Merced county, and at Denair.

E. E. Freeman, Holstein breeder of Modesto, has recently purchased the bull Segis Pontiac De Kol Burke Dutch from A. W. Morris & Sons to use as herd sire on his choice lot of registered females.

Purebred Stock Sales a Specialty

Sales Conducted in All Parts of Calif.

Ben A. Rhoades, Auctioneer

1501-3-5 So. Main St., Los Angeles, Cal.

M. M. Holdridge, proprietor of the Creamcup herd of registered Holsteins, reports the sale of two registered bulls to Mr. Avilla of Los Banos. Some very creditable records were made in this herd during the early winter months.

Goldie Donald, purebred Hereford heifer, to be sold among others at the D. O. Lively sale, Mayfield, May 3, 1917. Remember the Hereford breeders' meeting at the Palace Hotel, San Francisco, on the evening of May 2.

Innisfall Farm, Alexander & Kellogg, report the sale of two bull calves last week, one out of an imported heifer, to C. J. Kingry of Highland Springs, and the other out of an Eastern cow to A. G. Watkins of Bellots. As there is to be a classification for milking Shorthorns at the Chico Fair in May they will show a representation from their herd there, including their herd bull Glenside Royal, and two imported English cows. Bellvue Daisy, who won the silver cup at the Solano County Fair last year, has just completed her year's record of 8468.7 pounds milk and 321.67 pounds butter fat. In addition to this she suckled her calf for a month before beginning the record. Her heifer calf weighed 880 pounds as a yearling. They have a four-year cow that is now milking 50 pounds a day on dry feed. She has a fine roan bull calf that they will show at the State Fair.

A. B. Humphrey of Escalon reports that he has eight of his registered Guernsey cows on yearly test and that he expects to complete some very creditable records during the next couple of months.

W. J. Hackett of Ceres now has eight of his registered Jersey cows on yearly, semi-official test.

C. D. Hayworth, Jersey breeder of Modesto, has made recent sales as follows: A yearling bull, sired by Polly's Fancy Interest Lad, to O. McGee, Modesto; a nine-months bull, to Henry Knowland, Modesto; and a six-months bull calf to Robt. Rupp of Siskiyou county. Mr. Hayworth now has sixteen Register of Merit cows in his herd.

J. W. Benoit of Modesto, breeder of registered Holsteins, has a fine lot of young heifers sired by his herd bull, El Preda Wayne Colantha. This bull is characterized as the only one living whose dam and sire's dam average 5.1 per cent fat. Through this bull Mr. Benoit feels certain that he will develop a strain of high testing cows.

D. C. Carmode of Bishop, Inyo county, is getting started with registered Ayrshires. His herd sire is Willowmoor Sentinel the Fourth. Three females are also of Willowmoor blood; and the young bull Sierra Peter Pan is sired by Willowmoor Peter Pan the Twenty-sixth.

BEEF, HORSES, SHEEP.

W. E. Premo of Porterville has recently sold 1,000 steers to the Western Meat Company at \$120 per head.

E. H. Murphy of Perkins writes: "We have just shipped seven young Shorthorns to the Little Shasta Valley in Siskiyou county. I went with this stock to see the conditions of that locality and the stock they raise. Cattle raising is the principal industry of the valley. The native grasses, which carpet the floors of the valley, are just starting to grow. This feed grows three to five feet high and makes excellent hay as well as pasture. We are shipping a bred gilt to Nevada and a bull to Edinger & Johnson of Sacramento."

Wealthy livestock men of Colorado are in trouble, being charged with replacing sound horses accepted for war purposes with a cheaper lot, the difference in value being estimated at \$400,000.

CARRUTHERS SHORTHORN OFFERING.

[Written for Pacific Rural Press.]

One of the Shorthorn attractions of the year is promised at Mayfield, May 2, when W. M. Carruthers will hold his first annual auction sale of registered Shorthorns.

With unusual care and judgment Mr. Carruthers has selected in the past two years as choice a lot of foundation stock as can be well gotten together; and it is largely the progeny from this selection that will be offered in his first sale.

Being a strong believer in Scotch-bred Shorthorns, Mr. Carruthers has assembled animals from such great tribes as the Orange Blossoms, Ringmasters, Whitehall Sultans, Nonpa-

rells, and Choice Goods. The mature cows in the offering are all bred and safe in calf to his herd sire, Count Glory, a son of Count Avon, who was by Avondale, and he by Whitehall Sultan, and to Sultan Mayflower, a grandson of Whitehall Sultan, now in use at the University Farm at Davis.

At least four striking young herd headers of straight Scotch families are found among the bull offering, which also includes some two-year old straight Scotch bulls of a useful sort.

But it is in the heifers that one finds the greatest prospects; and it may be honestly said that never have as many choice Scotch heifers been offered to California buyers. With the exception of three head, all of last year's crop of heifers are included in the sale. Of the thirteen head, ten are by Fair Knight, a son of Choice Goods, and the others are by Sultan Mayflower, a son of Sultan Stamp. There are several likely show prospects in the lot; and all hold out great hope for the future. The entire offering is made up of individuals which cannot help but benefit the breed if intelligently cared for.

A NEW CALIFORNIA CHAMPION.

Pauline Inka Dekol Creamelle, a senior yearling Holstein heifer, owned and bred by F. Stenzel of San

Lorenzo, has completed a seven-day official test with a record of 423.4 pounds milk, 24.43 pounds butter, test 4.62 per cent, beating by over a pound all previous State records for the junior two-year old class.

This heifer's dam is Pauline Inka Dekol Kate, who has a record of twenty-six pounds as a four-year old. Her sire is Stenzel's young herd bull, Dutchland Sir Pietertje Creamelle, who was selected for the high test breeding in his pedigree. That he has power to transmit high production is proved by the fact that his ten daughters now in milk have records at two years or younger averaging twenty pounds. The best five of these average 22.22 pounds. They include two California champions, the present title holder and Clothilde Pontiac Creamelle, who last year made 22.52 pounds.

Mr. Stenzel and his manager, J. J. Sullivan, are justified in their expectation that Dutchland Sir Pietertje Creamelle will make Holstein history in California. He already has a record to be proud of.

STANFORD RANCH HOLSTEIN SALE.

Great interest has been aroused among breeders and dairymen by the announcement that the entire herd of 300 pure-bred Holsteins on the Stanford University Ranch at Vina, California, is to be sold at auction, June 5, 6 and 7, with M. H. Tichenor of Palo Alto as sales manager. Recent tests in the herd have developed a number of fine records.

The following statement by Geo. W. Wendt, chief herdsman at Vina, will be of particular interest: "After spending practically all my life among Holstein cattle, among some of the greatest herds in the East as well as the West, and after three years in charge of the Stanford herd, I am prepared to say that it is doubtful if ever before in the history of the breed in this country has a herd of its high standard been placed at public auction. I base my judgment upon my thorough knowledge of their production as well as their quality and individuality. It is what must be expected as a result of thirty-two years of constructive breeding."

During the summer months cows should not be kept in the barnyard over night. They should have a clean place to lie.

All cows should be treated with uniform kindness, and fed and milked at regular times by the same person, if possible.

GREATEST SHORTHORN SALE

ever held in the West from one farm. In this sale will be cows of rarest of Scotch breeding. Such stock can not be bought in the East, as there never before has been Count Avon stock sold at public auction.

There are eight yearling Bulls and Heifers sired by Sultan Mayflower—a bull purchased at the Harding sale by Leslie Smith, to head the Great Meadowlawn herd, which was known all over the United States for its great collection of Shorthorn matrons.

There will be ten Cruickshank Cows in the sale, which will be hard to duplicate in any herd for conformation, smoothness, size and finish.

The yearling heifers and bulls sired by a grandson of Choice Goods are large, smooth and thick, mostly all of Scotch breeding, and ought to please the eye of the most critical judge.

All the cattle are in good flesh, and anyone making a purchase to strengthen their show herds this year will have no trouble to get them in shape by fair time. This is foundation stock, tuberculin tested, and vaccinated for blackleg.

Visitors will be welcome at the farm any time before the sale.

Fast Cattle Vaccination.

[Written for Pacific Rural Press.]

Vaccination was under way at the rate of 50 head per hour on the Four C ranch in Inyo County when seen by the writer, March 23.

About 35 steers are first driven from the large corral into a small corral, 28x12 feet. At one end of the small corral, is a gate which opens into a gangway, 28 feet long and two feet wide.

About seven steers are driven into the gangway at one time. At the head of the gangway is a planked door, three feet high with a V in the center to fit the under side of the animal's neck. Directly above is a swinging iron bar with a V upside down, to fit the top of the animal's neck.

As the steer advances, a sliding bar is placed across the narrow

gangway behind him, thus preventing his retreat. When as far as he can go, with his head hanging over the door, the iron bar is brought down over his neck and clamped. Sufficient space has been left in one side of the gangway for the vaccinator's convenience. When vaccinated, the iron is raised, the door opened and the animal allowed to go free.

A similar iron, which is hung on the front or face of the door, with a V in the center to fit the animal's nose, is used in addition to the other for dehorning.

Four men, including the vaccinator, with a little added effort, could easily turn out 60 head per hour. The idea is claimed by Mr. Farrar, the foreman.—H. J. B.

Girl Wins in Hog Contest.

[Written for Pacific Rural Press.]

The Imperial Valley's first annual hog raising contest, held the middle of March, was a very interesting affair. Miss Barbara Leach of Westmoreland carried off first prize with 54 contestants. Miss Leach is a school girl 18 years old, yet she has proved herself the most successful hog raiser in the Imperial Valley. She won both in the profit per hog and in the increase in weight since the contest began. She has shown the older hog raisers of the valley that it does not pay to put a pig on alfalfa and rolled barley alone. She made a profit per hog of \$7.55 by feeding ground milo maize, tankage, and alfalfa. The cost of feeding under this method

per pound of gain was 6 cents. She has been offered 14 cents per pound for her herd of Durocs and has made more than 100 per cent by studying the feeding of hogs. Miss Leach started last year to keep accounts of what it cost to feed per pound of gain. She found that by feeding rolled barley and alfalfa pasture, it cost her 7.6 cents per pound the pig gained, the profit per hog being \$1.95. She next tried rolled barley, coconut meal, and alfalfa. This cost 6.7 cents per pound of gain. The profit on these hogs was \$4.37. Then she tried her present method which put her in the lead as a hog raiser in the Imperial Valley.

More Profit From Same Pasture.

[Written for Pacific Rural Press.]

One of the most serious conditions confronting land owners in most all of the older hill dairy sections along the coast is how best to restore the pasture lands that were once so productive of green feed but which are yearly growing less productive on account of over-pasturing.

It is admitted by those with experience that the problem cannot be solved in one or two years; but that it will require much time and study; and there is nobody more thoroughly convinced of the logic of this statement than J. D. Williams of Bodega, Sonoma county, who is admitted by people in his district to be one of the best farmers as well as one of their most successful dairymen.

Mr. Williams started a good many years ago to conserve the fertility of his pasture lands by reducing rather than increasing the number of cattle carried on a given amount of land. He realized that close feeding of grass during the growing season not only damaged the plants themselves but prevented them from re-seeding the land for future years as well. From early observations he saw that in many cases half the number of cattle on a given piece of land would produce as much or more because the larger number had to exist on the same amount of feed as the smaller number, and as a result were not nourished as they should be.

Pasture on Wornout Grain Land.—But simply being conservative in the number of cows he kept was not alone sufficient to guard against the future. He believed that the continuous cropping of the more level lands to grain and hay must some time wear out the soil; so he introduced a system of pasture rotation on his lower lands that has been highly satisfactory. The first field to receive this treatment was seeded twelve years ago to a mixture of Italian rye grass and clover seed, seeding being done after the first rains of the fall. There were twenty acres in this field, which had quit growing good grain.

The first year after seeding the entire field was allowed to ripen so that it might become better seeded before pasturing, as the stand was rather thin. For the next twelve years that piece was pastured, sometimes heavily, and besides it always grew a good crop of wild hay till 1916, when it was again getting pretty thin. A part of the field was plowed up that year and seeded to oats, which yielded a good crop, and the rest of the field was left to re-seed itself, which it did, with the result that it will produce a heavy growth of grass the coming spring.

Mr. Williams believes that by rotating pasture lands with grain and by spreading the manure with a manure spreader before the heavy winter rains start, most of the hill pastures can be kept producing good crops. But he is also firm in his belief that it is penny wise and pound foolish to overstock pasture under any circumstances.

CUTTER'S BLACKLEG PILLS

"California's Favorite" for nearly 20 years
For the Prevention of Blackleg in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only." Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock. Use any Injector, but Cutter's simplest and strongest.

Prices:
10 dose pkge. Single pills \$1.00
50 dose pkge. Single Pills 4.00
10 dose pkge. Double Pills 1.50
50 dose pkge. Double Pills 6.00
Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

The Cutter Laboratory, Berkeley, Calif.

The Cutter Laboratory of Illinois, Chicago

Soy-bean flour can be used successfully in making muffins, bread and biscuits much in the same way as cornmeal is used.

Veterinary Queries

Thousands of Cows Tuberculin Tested.

To the Editor! What has the State Veterinarian been doing about tuberculin testing under the new law?—Subscriber.

[Answered by State Veterinarian Chas. Keane.]

We are able to give you this information as we compile the work done each month. Consequently the following figures show the work which has been completed since the time the law became effective, October 1, 1916, up to and including February 28, 1917: Total number of animals tuberculin tested, 15,439; total number of reactors, 2,618; total number of premises on which tests were made, 348. When tests are applied in a dairy herd all animals in a herd are tested, including cows which are milking, as well as the dry stock.

The work is running along very smoothly and there is apparently, so far as we can learn, no decided opposition to the enforcement of the tuberculin testing provisions of the law. Unfortunately our facilities are inadequate in as much as the appropriation provided for this work, namely \$10,000, is so small that we can only cover a small amount of the ground. At the present time we have some 7,000 requests on hand for such testing, and strange to say many of these requests come from dairymen who do not have to comply with the tuberculin testing provisions of the law, in other words, from dairymen who sell milk wholesale or who sell cream to creameries. If the Legislature provides us with the appropriation that we are asking to cover all this work properly, we hope to be able to comply with all requests, whether from those who are affected by the tuberculin testing provisions of this law or otherwise, as we feel that it will be a means of showing many dairymen the conditions of their herds, and with the encouragement and assistance that this department can lend them will afford such dairymen the opportunities of cleaning up tuberculosis in their herds at minimum expense.

March 13, Sacramento.

Teats Do Not Give Milk.

[Answered by Dr. H. B. Winttingham, Petaluma, Cal.]

To the Editor: A young cow had her second calf a month ago. Three teats have not given any milk; the fourth is O. K. A veterinarian drew the milk with a tube and we used it for a week. A few days ago her udder seemed to fill and now we get a little from the teats, but it is not milk. We have doctored her all the time—camphor and oil on the bag night and morning. Has good appetite. Udder still caked badly on one side. Would the milk from the one good teat hurt anything if fed.—J. E. P., Suisun.

Do not use this milk. Give two drams potassium iodide in water twice a day.

Horse Thin and Coughing.

[Answered by Dr. H. B. Winttingham, Petaluma, Cal.]

To the Editor: A horse grows thinner all the time and coughs. The discharges from the mouth are very free.—M. H. L., Santee.

Any animal which harbors a disease dangerous to human beings should be destroyed. Have a qualified veterinarian examine this animal. An application to the State Veterinarian should bring results.

INNISFAIL DAIRY SHORTHORNS

GLENSIDE ROYAL 408155.

Our herd of registered Shorthorns has been carefully selected from the leading milk producing strains of the breed and is being developed along the same lines in our hands. The herd is headed by

GLENSIDE ROYAL

a prize-winner at the 1913 International and grand champion at Panama-Pacific Exposition.

Sired by him and out of large cows of good milk production, we offer for sale a few choice young bulls.

Our entire herd is tuberculin tested.

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Coulson Poultry & Stock Food Co., Inc., Petaluma.

Raising Poultry for Profit

COLONIZE THE SITTING HENS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

This month the hens will want to set; and if there are several of them, it makes quite a chore to look after them in separate places. Nearly every farm has an old shed or out-building that can be used for this purpose; and if it is fixed up right, a great number of chicks can be hatched with a few good hens. I have hatched as many as 400 chicks with hens, and they are always the best and strongest chicks, better than any incubator that ever was invented. I will give you the dimensions for making a 12-foot incubating box, and if you need a larger one you can add on to it. Now if you happen to have a shed that is 12 feet each way, it can be made to accommodate 20 hens, and 20 good hens can hatch enough chicks to pay for all the trouble of making the box. For a shed 12x12 feet, build a box 18 inches high, 10 feet long, and 8 feet wide, without top or bottom. Run partitions a foot apart the 8-foot way, making compartments 12 inches by 8 feet. Divide these compartments in two, at the center, making them 12 inches by 4 feet. The divisions can be made of wire if liked. This will give you 20 compartments. Nail an inch board 6 inches wide and 10 feet long across the top, 18 inches from each side, tacking it to each partition. Hinge doors to these boards, having the doors 18 inches by 3 feet, except one, which will have to be 18 inches by 4 feet. In this way each door covers three nests, except one which covers four nests. The space in the center, between the two 6-inch boards, may be covered by 2-inch wire netting, laths or strips of boards. This makes the top. The bottom is the ground, which should be clean and a little moist, but not cold and wet.

When you want to set a hen or two, raise up your covers and put your nests in. Use a couple of bricks or stones to keep your nest material from working away. Put a few tobacco stems or a little insect powder in the dust or dirt underneath and if there is any danger of mites or ticks put half a gunny sack in each nest that has been well sprinkled with coal oil. Over this put a shovelful of dirt and a little soft straw; then your eggs. Put feed and water at the other end of each run and dig up the ground so that each hen can dust herself when she gets off to feed. Change the water every day and when the hens are off take a look at the nests to see that there are no broken eggs. This gives a cool, light, quiet place for your hens. If they are put on these nests clean, they will keep clean and hatch the chicks with a minimum of labor.

Give the hens the same chance you would an incubator, test the eggs out and double up. Say you set three hens at one time, test the eggs about the fifth day for white eggs, seventh for brown, and if there are several infertiles, give all the eggs to two hens and reset the best

hen. Mark each nest with the date of setting and date they should hatch; then if memory plays you false, the record won't. If a hen breaks an egg, wash it off the other eggs as soon as discovered and see that none of the egg is left on the hen's feathers, as this may stick to more eggs and be the means or cause of more being broken.

CAUSES OF SMALL EGGS.

[By Susan Swaysgood.]

There are several reasons why hens lay small sized and unsalable eggs. They may be bred from a strain of hens that laid small eggs; and the remedy is to change strains. The next, and most frequent cause, is the too early maturing of the pullets, by feeding a ration that is too carbonaceous. In this case the remedy is to feed the chicks a rational, bone-making diet instead of a fat-making diet. A lot of people are feeding corn-meal and beef-scrap as a mash, and this matures Rhode Island Reds and all the larger breeds too soon before the frame is built. The result is weakness in legs, small eggs, and rather small body. Strange to say, it does not affect the size of body so much as it does the bone and size of egg. Another reason for small eggs is too fat hens. Some hens lay soft shelled eggs in a case of internal fat, others shell the eggs but they are small and almost devoid of yolk. In these cases, give your hens a dose of epsom salts every day for a week and feed a little less fat-making food and these hens will soon be normal.

COLORED MUSCOVY DUCKS—Quiet, quackless. Weigh up to 10 lbs. Good layers. Eggs, \$1.00 for 12. P. M. Cox, Sonoma, Cal.

PEKIN DUCK EGGS—\$1.00 per setting; Toulouse geese eggs, \$3.00 per doz. L. D. Collins, Denair, Cal.

PEKIN DUCK EGGS—\$1.00 per setting. L. D. Collins, Denair, Cal.

*Mrs. Best's Letter.***LATEST IN KITCHEN FURNISHINGS.**

Dear Friends: A furniture shop lately displayed a kitchen in its windows which had some novel features of which I thought you would like to know. The color scheme was blue and white. It may sound impossible for a kitchen, but was very light and pretty and easily cleaned. The woodwork was white. This is an advantage, I believe, because if enameled it can be washed. On the floor was linoleum of a white field with blue squares in designs. Other linoleum was displayed, too. The inlaid linoleum sells at \$1.25 and up per square yard. It is more expensive, but the color of the design goes clear through, so as it wears the design remains. It pays in the long run to put down this kind in places where it is to be permanent. It also comes in softer colors and prettier designs.

Up from the floor about four feet was put a lighter linoleum of white with blue lines imitating bricks. This finished in a board around the room and from there to the ceiling the space was covered with oil-cloth in all-over patterns of Dutch tiles. Each square outlined a Dutch figure.

The windows had flounced muslin curtains with a short valance across the top.

The ordinary kitchen chair was painted and enameled white, and around the edge of the seat blue squares painted so that there was a blue and white border. An old-fashioned New England chair was also painted white and a small footstool of simple design was there to enable the little ones to lift things from the high oven. The gas stove was enameled white also and the tea kettle, pans and coffee pot also were white enameled with blue trimmings.

Before the war this white ware was easily procurable from strainer to water pitcher, but this last winter has seen a scarcity of it.

On the wall near the stove hung a wooden rack that held white crockery decorated with blue for sugar, salt, tapioca and all the spices. Nice cookie jars and jam pots come in the same ware. When one is outfitting a kitchen this white and blue ware is very attractive and not very much more expensive than the ordinary agateware. Especially for the bride such a kitchen as described would appeal to fit up and own.

There are many new labor-saving inventions on the market now to help make kitchen work easier and more agreeable. A mop or cloth of copper and twine woven together removes the stains from pots with scarcely no effort. A plate scraper with rubber edge is quiet in use and saves the nerves. A metal scraper, an inch broad, removes the burnt particles on the bottom of a sauce pan with ease. And then there are strawberry hullers, which you hold between thumb and forefinger to save staining the hands. Apple corers and potato eye removers, too, lessen labor. Sanitary baking testers come in paper packages to obviate the use of straws from brooms.

THE HOME CIRCLE

There is also a small flat bottomed egg beater which fits into a cup which enables one to beat a single yolk without wasting all of it. Doughnut cutters, too, are shown, from which the center piece, which cuts the hole, may be removed, leaving a round cookie cutter. All these and other novelties lessen the steps in the kitchen.

Rosabella Best.

HOUSECLEANING HELPS.

Draperies that cannot be taken down may be freshened by brushing them with a whisk broom lightly dipped in gasoline.

In washing windows, it is a great improvement to use the powdered article rather than the Bon Ami brick. Shake the powder into a pan of water and then wash the windows. As they dry there will be a fine coating of powder left on them, which is easy to remove and does not scatter and whiten the ledges, as often happens when too much is rubbed on from the brick.

Matting on the floor should be swept with a broom dipped in hot water and then sponged with a flannel cloth dipped in salt and water. Do not allow the matting to become wet, but wipe quickly.

Mahogany, or well-finished oak furniture if scratched and soiled is improved by washing it with warm water and a good white soap, followed by an application of furniture polish. Wash only a small part at a time, dry quickly and rub with the polish before washing more of the surface.

Window shades that are soiled or worn at the bottom are much improved by cutting off the old part and making a new hem for the stick. Lay the shade out on an ironing board and press with a hot iron. Then turn the hem and stitch on the sewing machine. Use a long stitch, so as not to cut the curtain.

THE HABIT OF HAPPINESS.

Among the many things that children should be taught is the habit of being happy. Every mother desires that good trait in her children, but not every mother realizes how largely it lies with her own training to produce it.

The small baby should be cared for in a manner to keep him in a normal condition. Feeding and sleeping should be regular habits and if made comfortable the baby will be happy.

The mother's own manner can do much to develop a serene disposition in the child and care should be taken that the mother's work does not tire her too greatly, or the child will suffer.

As the child grows older, crying or fretting should be discouraged and one way or another should be checked. Pouting or sulking are just disagreeable habits that it is the duty of the mother to stop—not only for her own comfort, but for the later happiness of the child.

As the child grows older, the atmosphere of the home will have its effect upon him—a quiet, harmonious, happy home cannot help but make a child sunny and sweet.

NEW KITCHEN UTENSILS.

A new model laundry basket has compartments at each end to hold clothes pins.

For mixing pie crust there are paddles with raised disks on their surfaces to properly combine the ingredients.

A new flatiron holder is on the market that clamps onto the end of the ironing board.

A glove with a dust cloth attached is expected to appeal to the housewife who is careful of her hands.

There is a new dish-washing machine that can be placed on the sink shelf, that draws its water supply from the water faucet through a rubber tube. It also drains into the sink.

*Floral Department.***CHRYSANTHEMUMS.**

You can begin putting in cuttings of chrysanthemums now, especially of the dwarf growing varieties, such as Major Bounafore, Lady Hopetown, Gockets crimson, Neary Mason, etc.

Do not plant divisions, for you can never get large flowers from them. To get large blooms, the growth should always be soft wood, and by planting divisions you start with a hard-wooded plant. As to the location of a chrysanthemum bed: It should be in an open, sunny position, and sheltered from strong winds. The soil should be enriched with well-rotted manure, as chrysanthemums are very gross feeders. Never grow "mums" in the same location two years running, as they exhaust the soil, and you will have inferior blooms. If you want to grow large single-stemmed flowers, make your bed four feet wide and as long as desired.

Put in the cuttings now in sharp sand, in a warm but shaded situation; a small greenhouse, or a cold frame is an ideal location. In making the cuttings, take the tips, and what is still as good, make one or two eye cuttings; that is, cut off just below a bud and leaf, and just over a bud and leaf cut off the lower leaf. Your cutting should not be over one inch in length; and if the growth is long jointed, one-eye cuttings will do just as well. Put in cuttings so that the top eye is level with the sand. In a short time this eye will develop a shoot, and the cutting will root in from three to four weeks. Do not let them remain long in the sand after rooting, or they will grow spindling. It is advisable to pot them into two-inch pots, and as soon as established plant them in the bed where they are to bloom. Do not leave them in the pots till they get pot-bound, for this checks them and if they receive a check they never make a large flower. If you do not care to pot them, they can be planted in the bed where they are to bloom as soon as rooted, but they should be watered and sprayed when they are set out and shaded for a few days till they get established.

Plant small leaved varieties, such as chrysolord, Bounafore, Alice Day, etc., in rows ten inches apart, and eight inches apart in the row. If you make a cheesecloth house, six feet high, and as wide and long as you require, you can grow as good flowers as can be grown under glass, but my advice is to grow early blooming varieties. Those that flower in October. If you grow the large leaf kinds, such as Mendon, Earl Kitchner, Wm. Turner, etc., plant in rows twelve inches apart and twelve inches apart in the rows. If you do not want to grow single-stem plants, you can pinch them out when they are six inches high and they will throw up from three to six shoots, which you can let flower, in sprays, or you can disbud each shoot and get a good flower. These should be planted farther apart.

"That sermon you preached the other Sunday on Thrift had a great effect on me," said Griggs to his minister. "I went out before the collection."

To a Child Who Inquires

Composed by Olga Petrova.

HOW did you come to me, my Sweet,
From the land of no man knows?
Did Mr. Stork bring you here on his wings?
Were you born in the heart of a rose?

Did an angel fly with you down from the sky?
Were you found in the gooseberry patch?
Did a fairy bring you from fairyland
To my door that was left on a latch?

No! My Darling was born of a wonderful love,
A love that was Daddy's and mine,
A love that was human, but deep and profound,
A love that was almost divine.

Do you remember, Sweetheart, when we went to the Zoo
And we saw that big bear with a grouch
And the tigers and lions and that tall kangaroo
Who carried her babes in a pouch?

Do you remember, I told you she kept them there safe
From the cold and the wind, till they grew
Big enough to take care of themselves, and Dear Heart,
That's just how I first cared for you.

I carried you under my heart, my Sweet,
And I sheltered you safe from alarms,
Till one wonderful day the dear Christ looked down,
And, my darling, you lay in my arms.

The Lost Pan of Candy.

Charlie Gray and his sister Florence stood by the back kitchen window. This window looked out at Bennie Ware's back door, only one could not see the door now because there was a big snowdrift in front of it.

"Where did that pan of candy go, if Bennie Ware didn't take it?" cried Florence.

A few minutes before, she had set out a pan of hot molasses candy to cool on top of that big snowdrift, and now when they looked it was gone.

"I shouldn't wonder a bit if he took it," muttered Charlie. "A fellow that's too lazy to shovel snow away from his back door would be glad to get candy made by other folks, I guess."

"Sh!" whispered Florence, suddenly remembering that Bennie could hear them if he happened to be listening hard, for the two houses were very near together. "I guess he took it in fun and meant to bring it back. Let's wait awhile and see."

They waited and watched the top of the big snowdrift as if they expected to see the lost pan of candy come back to the place where they had left it.

"I know what I'm going to do," said Charlie at last. "I'm going over and tell his mother."

"Oh, Charlie!" Florence opened her eyes wide. "You wouldn't dare, would you? Just suppose he didn't take it!"

"Of course he took it." Charlie was quite sure about it by this time. "He could reach it by just opening the back door, and nobody else has been around."

Charlie looked very fierce as he jammed his cap on his head, but Florence stood looking at him doubtfully.

"The snow is so deep," she said, "you'll get in up to your chin."

"I'll take a shovel with me. I guess I'm not afraid of a little snow."

He got his snow-shovel from behind the door and began digging a trench through the big drift, so as to get to the back door of the Ware house. It was slow work, and after awhile Florence came to help with an old broom. The snow was light and dry, and it would have been no fun if they had not felt so vexed and worried about that lost pan of candy.

"It was going to be the best I'd ever made," said Florence. "And mother told us we could pop corn and roast apples after supper. It would have been as good as a party."

"Somebody's digging to meet us from the other side," whispered Charlie, stopping to listen.

They were half-way through the drift now, but it was still so high that they could not see over the top. They could hear the scraping of a snow-shovel on the other side.

"S'pose it's Ben?" asked Charlie in a whisper. "Maybe he's heard us shoveling and is ashamed of being so lazy, so he's trying to show off what he can do. I'm going to ask him what he's done with that pan of candy."

He had opened his mouth to call out, but Florence put her mitten

over it, and pointed with the other hand to something in the snowdrift right in front of them.

It was the lost pan of candy, all safe and ready to eat. The heat of it had melted the snow away under the pan, and it had kept sinking till it was quite out of sight from the window.

"I'm pretty glad we didn't say anything to Bennie about it," muttered Charlie, "or to his mother, either. Come on, Floss, let's hurry up and meet him before he gets through his side of the drift."

They set the pan of candy in a safe place, and dug away so fast that in a few minutes they could see who was working at the other side of the drift. And it was not Ben, but his mother, looking very hot and tired.

"Thank you ever so much for helping me," she said. "Bennie twisted his ankle this morning and can't stand on it, so I had no one to make a path for me, and Bennie couldn't see over that drift to your window. It's company for him to be able to look over your way."

"Oh, we would have helped before if we had known," cried Florence.

"Say, it's too bad about Ben's ankle," added Charlie, getting very

red in the face. "If I get my ailed, Mrs. Ware, couldn't we just haul him over to our house? We're going to have the kitchen all to ourselves this evening, and here's a pan of candy Floss has put in the snow-bank."

"Ask him," laughed Ben's mother. "I don't believe you'll have to ask twice. My, but it's nice to have such good neighbors."—Mabel S. Merrill in Zion's Herald.

The Only Way to Keep Up.

Philadelphia is to teach geography by moving pictures. That, says the Indianapolis News, is about the only way to keep up with European geography.

Good Faith

The Fair Treatment Guarantee—the *pledged* good faith of The B. F. Goodrich Rubber Company—takes the slightest shadow of a risk off Goodrich Black Safety Tread Tires.

You must get full value service from a Goodrich tire, or Goodrich wants it back forthwith.

Then Goodrich FAIR TREATMENT steps up and squares the debt of that tire—squares it gladly and generously with a liberal adjustment, bound to satisfy you.

For Goodrich accepts as the Company's *debt of honor* an obligation of tire service, worthy of the best fabric tire made.

There are no conditions, no catch words to Goodrich's world wide invitation:

**"Send back to Goodrich
ANY Goodrich tire you
believe owes you anything."**

"Best in the Long Run"

Good Health.

[By H. E. Pastor, M. D.]

Care of Young Children.

The Children's Bureau of the U. S. Department of Labor is issuing a series of weekly articles on the care of young children. This is a subject of important and widespread interest. Much of the illness and suffering among babies commonly attributed to the "second summer," or to teething, is really due to errors in feeding.

The following list shows the day's meals for a baby in his second year:

7 a. m.—Milk, zwieback, toast, or dried bread. 9 a. m.—Orange juice. 10 a. m.—Cereal, cup of milk. 2 p. m.—Broth, meat, vegetable, stale bread, baked apple. 6 p. m.—Cereal, milk, toast or bread. 10 p. m.—Milk (may be omitted).

Milk.—At this time the baby should be taking about one quart of milk in 24 hours; part of this may be poured over the cereal.

Cereals.—Oatmeal should be cooked three hours with a little salt in the water. It should be served without sugar, or with a very little only. The lighter cereals should be cooked at least an hour.

Breads.—Bread for young children must have been thoroughly baked and should be quite dry when used—that is, at least two days old. Tender toast is made by cutting thin slices from such a loaf and allowing them to dry still more, then toasting them to a delicate brown over a quick fire.

Fruit.—The child may have a small portion of baked apple or prunes once a day in addition to his morning feeding of orange juice. The apple should be baked very tender, and all the skin, seeds and hard parts should be removed. Prunes should be very carefully washed, soaked all night, then cooked until very tender with very little sugar.

Meat.—The child may have about a tablespoonful of scraped meat, or a soft-boiled or coddled egg once a day. Beef, boiled or roasted, the tender part of a lamb-chop, or the delicate meat of chicken or fish may be used.

Vegetables.—A small portion of some properly cooked green vegetable, like spinach or tender string beans, may be given. Such vegetables should be fresh. They should be cooked, then drained and mashed or strained through a colander.

Cancer in Drinking Water.

Some time ago we read a statement in the Engineering Record to the effect that cancer is water-borne and will some day be included along with cholera, typhoid and a number of other germ diseases in the list with which the water analyst has to deal, is suggested more strongly than ever before by the investigations on cancer in trout by the director of the State Institute for Malignant Diseases at Buffalo, and by the United States Bureau of Fisheries. Every one of the nineteen hatcheries examined from Maine to Sissons, Calif., had cancer incidence, and the same thing is said to be true of hatcheries in all parts of the world. Dogs drinking the water develop the growths, and so do rats fed on the scrapings from the hatchery troughs. Should filtering and chlorinating the water or

any other chemical water treatment prove beneficial, the fact would be of tremendous import to the water-works field.

California's Mineral Springs.

Among the resources of California of both actual and potential value are the mineral springs which abound in all parts of the State, says a report of the United States Geological Survey. Streams of pure water issue in large volume from the northern lava fields, but some of the desert springs yield strong brines. Some mountain regions yield springs of ice-cold water in midsummer, and in the same vicinity are pools of vigorously boiling water. Water so corrosive that clothing soon falls to pieces under its action, is common in some localities; in others issue springs of hot, soft water, excellent for laundry use. Several of the more noted springs are mere trickles of pleasant-tasting carbonated water; other and larger springs of more delicious natural "soda water" are at present remote from roads and are known only to the hunter and prospector. Many springs form deposits of salt that are welcomed by cattle and wild animals as "deer licks"; others are a menace to small life because of the purgative salts they contain or of the great amount of carbonic acid gas they give off. The chemical constituents produce notable coloring in many waters, giving in some springs shades of yellow, green or blue, and even milky and inky-black streams.

This is Styleplus Week from Maine to California!

The price remains the same!

Leading merchants the nation over are this week featuring Styleplus Clothes \$17. Today more than ever before this price stands out to the nation. Our Style, our Quality, our Guarantee of Satisfaction have created a new standard of value at \$17 from Maine to California!

Styleplus \$17 Clothes

"The same price the nation over."
(Price in Cuba \$23)

By contracting for great quantities of cloth at the outbreak of the war, by doubling our output and so decreasing our costs, by our scientific plan of concentrating on this one-price suit we have effected great economies and kept our price the same. The same style in the fabrics—all-wool or wool and silk. The same honest, sincere workmanship throughout. The same smooth fit and splendid wear. The same guarantee! The same price!

Of course you realize how big an advantage it is to see and try on the clothes before you buy them. If you buy direct from the nearest Styleplus dealer, you know exactly what you are getting. Look for the Styleplus Label in the coat collar. If there should not be a Styleplus Store in your town, ask your favorite dealer to order a Styleplus suit for you.

Trade Mark Registered

SAN FRANCISCO.

San Francisco, April 11, 1917.

WHEAT.

Trading in wheat the past week has been of a very nominal order, due to the scarcity of stock for general offering. Some re-cleaned Sonora wheat went on sale at \$3.75@3.85 per cental, while both California Club and the Northern Red varieties were higher.

Sonora Wheat, re-cleaned.....\$3.75@3.85
Northern Club, none up and.....\$3.25@3.35
California Club, per ctn.....\$3.25@3.35
Northern Red, none offered
Northern Red.....\$3.50@3.55

BARLEY.

While country reports indicate a fair barley crop this year, the situation of the local market during the past week has been the steady and rapid rise of the December option. Spot barley held unchanged in the face of light offerings, but very active business in futures was reported. It is reported that some producers have already contracted their next year's crop at \$1.90@2.00. Many herd owners in the interior have been forced to continue their purchases of feed barley at the present high prices, owing to the slow development of green feed.

Shipping, ctn.....Nominal
Brewing, ctn.....Nominal
Choice feed, ctn.....\$2.50@2.60

OATS.

Buying for feed and shipping purposes put the quotations on oats up again this past week, and local reserves are of the opinion that the end is not yet reached.

Red feed.....\$2.25
White.....\$2.50@2.55

CORN.

The Eastern corn market is so unsettled that no reliable quotations on to arrive goods can be given in this market. Several lots were reported to have been bought at \$3.35@3.50 per cental, although this has not been verified. However, California sacked goods advanced sharply this last week, with Milo maize and Egyptian corn a close second and third.

(First-hand prices on strictly first-class grain, San Francisco.)
Eastern Yellow, ctn., bulk.....Unsettled
California, sacked.....\$3.00@3.10
Milo Maize.....\$2.75@3.00
Egyptian.....\$2.90@3.10

BEANS.

Red kidney beans failed to advance during the past week, this being the only variety to hold steady. There is an especially good call for large and small whites and the local trade looks for a still further advance on these varieties. The East is buying here in large quantities as can be had, there being no big lots left in this market. Several of the brokers here are very active in trying to line up future contracts, this business being said to come from the allied governments. It is known that Great Britain has contracted for a very large supply from this State next season, and there is every reason to believe that they are after more stock. Reports from producing sections indicate that very few of the producers are accepting the present bids, which would indicate that they are alive to the situation.

Bayos, per ctn.....\$ 8.50@ 9.00

Mexican Reds.....9.00@ 9.25
Tepary beans.....9.00@ 9.25
Garbanzos.....4.75@ 5.25

HAY.

Receipts of hay in this market fell off last week, mainly due to buyers from one section of the country shipping direct to another country section instead of here. Arrivals were 1,711 tons, as compared with 2,063 tons the week before that and 1,683 tons on the preceding week. All grades and varieties of hay have been advanced again and almost daily changes are reported in this market. The pasture situation is the worst seen in some years and even belated rains cannot help in the way that the farmers of this State need. With the cold weather holding back the new crop of hay, little relief from high prices can be expected for some time.

(Price per ton, car lots, San Francisco.)
Wheat, No. 1.....\$23.50@31.00

Straw, per bale.....1.00@ 1.25

FEEDSTUFFS.

Very sharp advances on feed stuffs have been the general rule this past week, with the exception of a few of the less called for lines. Even these are expected to advance this coming week, as their lower price makes them an attractive buy at present. The heaviest gain was made on cracked corn, which is now commanding the almost prohibitive price of \$65 per ton.

(Per ton, San Francisco.)

Beet Pulp, per ton.....\$33.00@34.00
Alfalfa meal, per ton.....26.50@27.50

POTATOES, ONIONS, ETC.

New crop vegetables are becoming more and more of a market factor. New Summer squash from the Imperial Valley is now being offered here in a small way at \$3.25@4.00 per twenty-pound box. Green onions are selling at \$1.00@1.25 per lug box and small lot of crystal whites from the Imperial Valley brought 14 cents per pound. Australian stock is again furnishing the bulk of the trade at \$7.00@9.50 per cental. New potatoes command

THE MARKET REPORTS

Figures Given Are Independent and Reliable.
Prices Quoted as Paid to Producers.

as high as 8 cents per pound for very fancy, although the general top is 6 cents. Old potatoes are being shipped in good-sized lots and the quotation on this offering has advanced. Delta celery is bringing up to \$2 per crate on salable stock, with considerable off-grade stock put on sale. Peas have gained a cent under short receipts, with most offering of only fair quality. Asparagus is commanding 4@6 cents per pound, with receipts averaging 5,200 boxes per day.

BUTTER.

While quotations on butter closed a cent off from the opening prices, this is only to be expected when the increase of 200,000 pounds in receipts over the preceding week is considered. Present prices are too high to warrant storing and it was necessary that prices should drop to such a level that shipping could be attracted. The only butter in local ice houses at this time is some "short-held" goods intended for government contracts. The East has again been a customer in San Francisco and Northwestern points are also buying fairly freely.

Thurs. Fri. Sat. Mon. Tu. Wed.
Extras.....40 40 40 38 39 39
Prime firsts.....39 39 39 37 38 38 1/2

EGGS.

Last week's receipts of eggs were about the same as for the week before, but a better shipping call was ruling, and prices have been steadily advancing. Storage holdings at present run, in the neighborhood of 38,000 cases, or about the same as for the corresponding date last year. Seattle has again been buying eggs in this market and Los Angeles interests have taken several carloads of storage packed eggs from Petaluma. With quotations on eggs holding steady throughout the entire country, there is every reason to believe that poultrymen of California are to enjoy a prosperous year.

CHEESE.

Slightly lighter receipts, said to be the result of the shipment of four cars direct from the factories to Eastern points, con-

tributed to a firmer cheese market last week. Old style Fancy Flats closed the week a cent higher at 21 1/2 cents and Young Americas fancy added a half cent. Y. A's.....24 1/2c
Fancy Calif. Flats, per lb.....21 1/2c

DRIED FRUITS.

An advance of 1/4@1/2 cents per pound on futures peaches was the principal development of the week in the dried fruit market. There is still a tendency on the part of both buyer and seller to hold back, both anticipating a better market from their viewpoint. Some apricots were contracted for at 15 cents in Orange county.

LOS ANGELES.

Los Angeles, April 10, 1917.

Receipts of week ending April 10.....301,190
Receipts of past week.....505,500

While the general tone of the market here the past week was firm and last Friday extra on call was bid up to 40c, and this advance maintained on Saturday, this strength was due to a temporary scarcity caused by an accident on the Southern Pacific Valley line. Chicago advanced 1c up to Monday and New York 1c. With the opening of the current week Monday, a number of delayed shipments made the receipts heavy and on call extra sold off 3c and the market closed the same as a week ago. As San Francisco went off 2c and altogether the tone of the market was easier and buyers less anxious for supplies, now that receipts have become normal again. Tuesday brought no change. San Francisco was up 1c, but as the receipts were liberal and the eastern markets unchanged, this had no influence upon the market here.

EGGS.

Receipts (railroads) for week ending April 10, 1917, 3,231 cases.
Receipts (railroads) for week ending April 10, 1916, 4,469 cases.

Not so many coming in the past week and San Francisco was higher. This with a good consumptive demand and lighter production of local eggs than a year ago caused a higher market throughout the week. Extras were bid up 2 1/2c up to Monday, case count 1c and pullets 2c. Case count are now 9c higher than this time last year. Chicago declined 1c during the week and New York 1 1/2@2c. But this had no influence upon the market here. The face of light arrivals. While the local trade took eggs fairly well at the prices, there was but little doing by the cold storage people at the advance.

Imperial Valley, 7 mos.....30@35c
Newlands, year's.....35@40c

HIDES.—Tanneries are showing more anxiety to get hides, but are not yet coming up to packers' prices and there is practically no movement.

Los Angeles, April 10, 1917.

CATTLE.—A firm and steady market was had the past week for all good killing steers. A more quiet beef market and the Eastern markets unchanged caused a weaker feeling among buyers, though for what steers and cows that suited they paid steady prices, as the offerings were not heavy. California and Arizona furnished most of the supply and the quality was about as usual for this time of year.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs.....\$9.50@10.00
Prime cows and heifers.....7.50@8.00
Good cows and heifers.....7.00@7.50

HOGS.—A firm market and fair demand was had the past week. California fur-

nished most of the hogs coming in, and as last week a big part out of the receipts were light weights. Hogs that were being forced to market by the high price of feed and before they were matured. Not many good packing hogs in and the few brought a premium over quotations in sympathy with the high markets East.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 300-350 lbs., \$11.50@12.00
Mixed, 200@250 lbs.....12.00@13.00
Light, 150-200 lbs.....12.00@13.00
Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP.—While this market the past week showed no change, the demand was hardly so urgent, the high prices inducing lighter killing; the market having quieted down. Lambs are coming in more freely and the high prices caused killers to hold back and do more or less picking around. Heavy sheep continue rather scarce and the market for them fully steady under light offerings.

Per cwt. f. o. b. Los Angeles:
Prime wethers.....\$ 9.00@10.00
Prime ewes.....9.50@10.00
Yearlings.....10.50@11.00
Lambs.....13.00@14.00

CALVES.—Market dull and weak;

a good many being driven to market by the high price of feed. Selling slowly at \$8.50 @ \$9.25 per cwt.

No. Portland, Ore., April 9, 1917.

CATTLE.—Today's receipts of cattle were about 700 head, which included only three loads of good topy beef. The balance of the run was of light medium and ordinary beef and a good supply of stocker and feeder cattle. The market opened briskly, there being a large list of buyers here.

BEEF STEERS.—Prime beef steers are getting to be a scarce article around the yards, only two loads of real fat beef steers being on the market today. There was an excellent demand for all grades and an active and higher market ruled. One load of heavy grain-fed steers brought \$9.75, which was about 20c higher than last week, while a load of good light Idaho steers sold for \$9.75. The top on the day's trade was \$10.00, one bunch from Bend. The big end of the medium to good beef steers brought \$9.00 to \$9.50, while ordinary grades brought from \$8.50 to \$8.75. Several loads of feeding steers brought \$8.40, with stockers from \$7.00 to \$8.00. Prices on all beef steers were mostly 25c higher, with feeding steers selling from 10c to 15c higher.

COWS AND HEIFERS.—There was an excellent demand for the light supply of cows here; the prices were all 15c to 25c higher than last week. Prime cows, which were here only in small bunches, sold at \$8.50, while several loads of good beef cows brought \$8.25; medium grades from \$7.50 to \$8.00.

BULLS.—Bulls were in good supply, with a fairly good demand at steady to higher prices. A number of good heavy bulls brought from \$7.00 to \$7.50; medium heavy ones sold from \$6.50 to \$7.00.

HOGS.—There was a good supply of porkers over 1500 head. Demand was good, and prices, after being at a standstill for over a week, took another spurt to a new record level. The quality of the run was fairly good, although no real topy hogs were included. The best load in the trade brought \$14.65, while the bulk sold from \$14.50 to \$14.60. Trading was quite active.

SHEEP.—There were no sheep received today. Prices remain steady.

better. Turkeys, ducks and roasters continue steady and in fair demand. The high prices in the Central West shutting out shipments from there.

We quote from growers:

Broilers, 1 1/4 to 2 lbs.	30@31c
Fryers, 2 1/2 to 3 lbs.	28c
Hens over 4 lbs.	23@24c
Hens, under 4 lbs.	20@21c
Ducks	22@23c
Geese	18@19c
Roosters, 3 lbs. up (soft bones)	26c
Turkeys, heavy, 12 lbs. and up	29@30c
Turkeys, light	24@25c
Squabs, live, per doz.	\$1.50@3.00
Dressed	3.75@4.85

BEANS.

There is no change to note in this market since our last report. With light stocks and planting yet to be done, holders are firm in their views. Buyers, however, took hold sparingly, as might have been expected at the high prices.

We quote from growers:

Limas	\$13.00@13.50
Large white	12.00@12.50
Small white	12.00@12.50
Pinks	9.50@10.00
Blackeyes	7.50@ 8.00
Tepary	9.00@10.00

HAY.

A very firm market and fair demand was had the past week for most offerings, as the week before the enquiry was mostly from the country and for horse hay, which found ready sale at full quotations. The dairy people continue to use mostly green alfalfa or prices would have been higher. Receipts light; only 16 cars.

We quote f. o. b. Los Angeles:

Barley hay, ton	\$21.00@23.00
Oat hay, ton	22.00@24.00
Alfalfa, northern, ton	20.00@22.00
Alfalfa, local, ton	22.00@23.00
Straw, ton	11.00@12.00

CABBAGE.

The scarcity of good cabbage noted a week ago continues. The season is very backward for new cabbage and all winter cabbage is gone. Shippers are in the market for all good firm heads and are paying as high as \$4.25@4.50 per cwt. to growers. Poorer and less firm heads that depend upon a home market, \$3.50@3.75 per cwt.

BERRIES.

More strawberries in the past week and the quality was very good of most offerings. Imperial Valley and local both on the market. With freer offerings lower prices prevailed, putting them in the reach of a greater number of consumers, hence a more active movement.

We quote from growers:

Poor to choice, per crate of 30 baskets	\$2.50@2.75
Fancy, per case of 30 baskets, case	3.00@3.25

ASPARAGUS.

The market was well supplied the past week and with increased offerings prices ruled lower. Demand fair, however, for all good "grass," Imperial Valley bringing 9@10c per pound; Grand Island 10@12c per pound, and local 8@11c per pound.

Special Citrus Market Report

Los Angeles, April 10, 1917.

Shipments of citrus fruit from Southern California from November 1 to April 8: Oranges 17,324 cars and lemons 2,960 cars. Same time last year: Oranges 14,324 cars and lemons 2,435 cars.

Shipments from Central California from November 1 to April 6: Oranges 4,055 cars and lemons 164 cars. Same time last year: Oranges 4,243 cars and lemons 146 cars.

Shipments from Northern California from November 1 to April 5: Oranges 844 cars and no lemons. Same time last year: Oranges 610 cars and lemons 1 car.

More active shipments and heavier offerings on the eastern markets the past week caused a break in prices of both oranges and lemons. Still prices of all good fruit and the best known brands were fairly good. While the shipments were the heaviest for a long time the trade absorbed them without any serious loss and prices have been averaging higher than a year ago. Locally the situation is much the same as a week ago. All highly colored large oranges were in good demand and brought a little more money. Small sizes, however, were dull and weak. The demand seemed to be mostly for the larger oranges. Local packers were paying 1 1/2@2c per pound in the grove picked for oranges, the latter price for nice big oranges. Grapefruit was quiet, though what selling brought last week's prices 2@2 1/2c per pound in the grove picked. But few tangerines in and they were dull at 1@1 1/2c per pound in the grove picked. Lemons continue to drag. Offerings good and only the best bring 1@1 1/2c per pound in the grove picked. All else have had to be sold for what they would bring.

AUCTION SALES.

New York, April 9.—Forty-nine cars of navel, one car of bloods, six cars mixed navel, bloods, tangerines, St. Michaels and Valencia and four cars lemons sold. Market lower on both oranges and lemons; weather fair, preceded by heavy snowfall. California navel averaged \$1.80 @ \$3.35. Lemons averaged \$2.00@ \$3.35.

RAISIN PRICES NAMED.

Raisin shipments first three months of 1917 were three times as great as same period of 1916. James Madison was not re-elected manager. Opening prices for 1917 layers and clusters same as named after last fall rains. Sunmaid layers, 20-pound box, \$1.50; 6-crown Imperial clusters, 20-pound box, \$2.60; fancy Sunmaid clusters, four 5-pound cartons, per case, \$2.60. Prices f. o. b. California. Biggest advertising campaign planned for raisins. United States exports, seven months ending January, 1915, 18,567,342 pounds; same period, 1916, 58,615,974 pounds; same period, 1917, 38,523,386.

Bloods, halves, averaged \$1.15@ \$1.70 and tangerines averaged, halves, \$1.15@ \$1.70. Boston, April 9.—Thirty-two cars sold. Market slightly lower on both oranges and lemons. California navel averaged \$2.20@ \$3.75. Lemons averaged \$2.85@ \$3.35. Philadelphia, April 9.—Twenty cars sold. Market 10 @ 20c lower on oranges; unchanged on lemons. Snowing. California navel averaged \$1.50@ \$2.90. Lemons averaged \$2.35@ \$3.25.

MISCELLANEOUS.

FOR SALE—Flour Mill Rolls, 4 inch each. Stand. Allis Chalmers Co. pattern. Rolls 9 in. diam. x 18 in. long, all complete with shaker, feed counter, shaft driven and differential pulleys. Suitable for grinding or crushing barley, wheat, rye, corn or rice for feeding horses, cattle, or hogs. For prices, capacity and particulars, write H. B. Barkis, Lodi, Cal.

EVERY SIZE WROUGHT IRON WATER PIPE and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a Square Deal. Weissbaum Pipe Works, 160 Eleventh St., San Francisco.

GROCERIES WHOLESALE—Our prices are the lowest and our quality the highest. Dollars saved on every order. Freight paid within 100 miles. Send for catalog. Freese and Company, Mail Order Grocers, 1264 Divisadero St., San Francisco.

SECOND-HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. Shecter Pipe Works, 306-S Howard St., San Francisco.

AT LAST THE PERFECT SILO—THE Star Round. No hoops. No bolts. No experiments. Any one can erect. Close price. Address D. O. Lively, 215 Hobart Bldg., San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency, Savings and Loan Building, Stockton, California. Established fifty years.

FOR SALE—Stock ranches and orchard; 20 Durham bulls, 60 dairy cattle. Fred W. Willson, Box 582, Gilroy.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. Smiths' Cash Store, 106 Clay St., San Francisco.

SEEDS, PLANTS AND TREES.

FOR SALE—Walnut Trees. Magnolia Nurseries, Whittier, Cal.

ALFALFA SEED—There is a difference in the varieties and strains of alfalfa seed. Send your address for sample and our low price, and we will tell you just how our seed is selected—and why. Bomberger Seed Co., Modesto, Cal.

JUST ARRIVED, another car fine low-top Burbank seed potatoes; special hill selected; fine strain. A few sacks of American Wonder. H. A. Hyde, Watsonville, Cal.

WANTED.

WANTED—Young men and women to attend the Western Normal Courses—Normal and Academic. The Normal Course gives an adequate preparation for teaching at a great saving in time and money. Academic course gives practical finish to education. Write for Bulletin "A," Western Normal, 524 E. Market St., Stockton, Cal.

WANTED—Capable, energetic man to take charge of our business in California. Must have Ford automobile and \$300 in cash. National Development Company, Bedford, Virginia.

COUNTRY LANDS.

ORCHARDISTS AND DAIRYMEN—Before you invest, investigate Mountain View, in the center of Santa Clara County's fruit and dairy section. 5 miles from Stanford University, 35 miles from San Francisco. Rich soils, abundance of water. Ideal climate. Write for catalogue, "California's Choice Acres," William P. Wright, Mountain View, Santa Clara Co., Cal. The Oldest Real Estate Office in Northern Santa Clara County. Established 1901.

ALFALFA LAND FOR DAIRYING—Also first-class orchard land. 10 acres and up. Brentwood irrigated farms in Contra Costa County, 63 miles from San Francisco. Easy terms of payment. For prices, etc., address Balfour, Guthrie & Co., Land Department, 350 California St., San Francisco.

\$5,450.00—Andrew Linquist, 20-acre Peaches and Grapes ranch, two miles west Kingsburg, California. Improvements. Half interest. Pumping plant. See Linquist, C. E. Robertson, 105 Montgomery St., S. F.

B. S. COELHO, CORCORAN, CAL., Owner—150 acres improved, subdivided alfalfa dairy. Stratford. Keeps 85 cows. C. E. Robertson, 105 Montgomery St., San Francisco.

STEVENS COUNTY—Logged-off land where stock-raising and dairying pay. Free booklet. Phoenix Lumber Co., Crop Department, Spokane, Washington.

WANTED to hear from owner of good ranch for sale. State cash price and description. D. F. Bush, Minneapolis, Minn.

FREE NEW BLUE BOOKLET—State, Government and Indian Lands. Bargains overlooked. Joseph Clark, Sacramento.

FISK Non-Skid TIRES

They have the stamina, the strength and the endurance of blooded stock. Our long experience in tire making enables us to build Fisk Tires with a pedigree and get those qualities which stand for real dollar-for-dollar value to the man who buys them. *Fisk Tires are pure-bred tires.*

Every user knows it and knows too that there is no greater tire value on the market.

Buy at least one—compare the value you get in Fisk with any other make of tire—thousands of Fisk buyers began to use Fisk by making that dollar-for-dollar comparison, and they are using Fisk today.

“When you pay more than Fisk prices you pay for something that does not exist”—that’s something to remember when buying tires.

A special feature of Fisk Tire Value is the policy of Free Service through Fisk Branches in more than 125 principal cities throughout the country. There are Fisk Branches in your State,

where your home dealer buys direct and is always sure of promptest attention to your wants. And when the Branch is convenient you can go there any time, *whether you use Fisk Tires or not*, and make use of the only uniform and complete Free Tire Service in the country. There is no charge at any time except for supplies and actual repairs. Take the first opportunity to get acquainted with *Fisk Service*, Fisk Organization, Fisk Methods and Fisk Products.

If you do not find a Fisk Branch in the partial list below that is convenient to where you live, write for complete list—there may be one nearer you.

Apricot Blossom and Twig Blight and Sour Sap.

[Written for Pacific Rural Press by Prof. R. E. Smith, University of California.]

MANY inquiries are being received regarding the sudden blighting of the blossoms and twigs of apricot trees in the San Francisco Bay region. The trouble is caused by a familiar fungus, the *Monilia*, which is best known as the cause of the so-called Brown Rot of the fruit of apricots, plums, cherries, peaches, and other stone fruits. This rot of the nearly ripe fruit occurs more or less every year throughout the region where the twig blight is now so abundant. One of the commonest effects of brown rot is the production of "mummies": dry, dead fruit which hangs on the tree all winter. In the early spring gray, mold-like spore masses of *Monilia* appear upon the surface of these mummies and cause more or less infection and blighting of the new blossoms. Usually this form of the disease is not abundant, but in certain seasons or certain orchards it develops to an unusual extent, reaching a maximum at times like the present when the fungus grows from the blossoms down into the twigs or even into large limbs, causing a blighting of the fruiting wood and considerable gumming on the twigs and affected branches. *Monilia* is not usually a very active parasite, confining its attacks to the ripe or nearly ripe fruit. The twig blight effect is usually the indirect result of cold weather and frosty nights during the blooming and fruit-setting period. When such weather occurs the blossoms and twigs are either slightly frozen or their resistance is lowered and the fungus is then able to attack the weakened tissue. This year we have had just the right combination to produce this effect, namely, plenty of *Monilia* spores on mummies and blighted twigs of last year, continued cold weather, and enough rain during the blooming period to give the fungus a good chance to develop. The fungous effect has also been complicated with straight frost injury, many orchards having been frozen to a greater or less extent. The amount of *Monilia* twig blight is everywhere directly proportionate to the amount of frost which has occurred in the orchard.

Spray and Remove Mummies.

Knowing the cause of the trouble, the orchardist is next most interested in the question of what to do about it. In such seasons as the present one, it is doubtful if any treatment would be practical in the worst affected orchards, since the fundamental trouble is climatic rather than fungous. It should be understood, however, that the injury is now about at an end, the affected twigs are sending out new growth below the dead portion and from now on the trees will rapidly improve in appearance. Another year, with more normal weather conditions, the trouble probably will not occur at all in most orchards. The experience of various growers has shown the following: No good is accomplished by spraying before the blossoming period. It is too late to spray for this blossom and twig blight after the trees are in full bloom. Apricots may be sprayed without injury at any time while in bloom with lime sulphur of a strength of 1-25 or even stronger. To control the brown rot of the fruit, spraying after the fruit is

half grown must be approached with great caution, as any spray is likely to show on the ripe fruit and injure its sale. The so-called self-boiled lime sulphur is commonly recommended for this purpose, but its use has been attended with more or less injury in this section. The same is true of the various sulphur paste preparations. Apricots may safely be sprayed at the present time with lime sulphur, 1-30. It is still an open question what spray can be safely used later in the season. All mummies should be removed from the orchard and destroyed in the fall and the blighted twigs should be cut out as thoroughly as seems practical. It would also be advisable to spray the trees next spring, just as the first blossoms are opening, with lime sulphur, one gallon to twenty-five of water. These efforts may be expected to give good results in a normal season, although with any such amount of cold weather as has occurred this spring no treatment would do much good.

Whitewash in Fall.

Another effect of cold weather this year is seen in the large amount of so-called "sour sap" and similar troubles in young apricots, peaches, cherries and other kinds of trees. This shows in a failure of the trees to start into growth, more or less gumming in spots or pockets on the trunk with a darkening or dying of the inner bark, especially on the sunny side of the stem, and fermentation of the sap. "Sour sap" takes many peculiar forms and the term includes a variety of troubles, but the prevailing disease in young trees, as just described, is undoubtedly a form of winter injury and a climatic effect. Young walnut trees are also very commonly affected this year, but without gumming or souring as in the stone fruits. It is extremely advisable that the trunks and first branches of all young trees be coated with a thick whitewash about November first, in order to prevent this sort of trouble as much as possible.

The dying and dropping of apricot buds is also prevalent this spring. This is another combined climatic and fungous effect, being usually due to cold weather and an attack of the peach blight fungus, *Coryneum*. Spraying with thick Bordeaux mixture or lime sulphur about November 15 will help to minimize this injury.

Spray Schedule.

The best known treatment for apricots in the San Francisco Bay region or other localities near the coast is as follows: For bearing trees spray with heavy Bordeaux mixture (6-8-50) or lime sulphur (1-12) between November 15 and December 15. The object of this is to prevent infection of the buds with the *Coryneum* (peach blight) fungus and also to clean up, as far as possible, the spores of this fungus and those of the brown rot (*Monilia*). Just before the buds open in the spring a spraying with 1-8 lime sulphur may be advisable, particularly if there is any trouble with scale insects, peach worm, or any of the various forms of shot-hole fungus. Then, just as the first blossoms are open-

(Continued on page 500)

Blossom and twig blight of apricots, which is so prevalent this year in the counties about San Francisco Bay. This is caused by the *Monilia* (brown rot) fungus infecting the blossoms and running down into the twigs. The extensive infection this year is due to the fact that the trees have been much weakened by continued frost; such trees may be expected to recover from now on without recurrence of the trouble another year unless similar frost conditions prevail.

EDITORIALS

PATRIOTISM.

OUR national share in the great war has given world-wide satisfaction. Rudyard Kipling has written a poem to us. Lloyd George says we have struck a greater line of throne-busting than we did in 1776. The Kaiser says: "Go to it, Sam: nothing you do will interfere with my plans." And so our part in the war seems to please everybody and incommode nobody. It reminds us of another sad event which was just as jolly. A tourist, with a taste for fatal-disease figures, stepped into a funeral which was being held near the highway, nudged one of the weepers, and, pointing to the casket, significantly whispered: "What complaint?" "No complaint at all," the sobbing friend replied: "Everybody perfectly satisfied." And this is surely our national attitude toward this new struggle for the supremacy of democratic principles. Everybody is patriotically behind President Wilson and loyal to his leadership. Even the foremost pacifists have heard a higher cry than peace, when there is no peace. Our Dr. Jordan has hurried home from Eastern peace platforms to get his gun and William Jennings Bryan has gone out on a hot trail after war-like conservation. And the two-fold reason for this universal satisfaction over our entrance upon this dreadful blunder of war is patriotism coupled with the conviction that the way to bring the world out of this gulf of inhumanity, perhaps forever, is to go through and not around it. The stronger the plunge the sooner the crossing: that is the way the American people are going in!

PATERNALISM.

BUT we are not so sure that we ought to be so complaisant over the way agricultural warthings are going. This is our part in the great tumult and we have a right to speak. All we have to look out for is not to get ourselves interned, with no paste-pot and scissors within our reach. And all the complaint we now have to make is that things are going our way so fast by aeroplane that our one-cylinder tin box can hardly keep us in sight of their great wings. Some of our readers have blamed us for doing too much paternalism. They have tried to show us that overhead influence for fair money, fair labor and fair trade for farmers would invertebrate the most independent and individualistic class of our American citizenship and that if we did not stop urging such things we would enserf the very people who have made our country great. This claim did not impress us much at the time and so we kept on, with others, doing our best to secure from financial and political higher-ups recognition of the farmer's right to have government influence and aid toward cheaper money, wider practical education, promotion, protection, and the right to organize to secure a selling-price above the cost of production. In all these things, and others like them, we insisted that Uncle Sam should see to it that his six million farmsteads should

have equal chance with his other nephews, and that farmers should be urged and inspired to organize to secure these things for themselves and make them work out safely and successfully. And we have resolutely claimed and demonstrated that such things would increase initiative and confidence among American farmers and could in no way transform them into a class of jelly-backed peasants. And we have recklessly declared that if such things constituted paternalism, we were for paternalism!

GRANDPATERNALISM.

BUT now we are a little scared lest, by the operation of the agricultural aeroplanes which the preparedness movements have set free, critics who were shocked by our simple and elementary paternalism, as above outlined, may be thrown into fits. For the powers that be of preparedness seem to be disposed to assume positions toward the upstanding independent American farmer which are not the discriminating and inspiring domination of a benevolent and quick-witted national uncle, but the overlordship of a doddering, but foxy, national grandfather—in short, there seems to be some danger that Uncle Sam may become Grandpa Sam!

Never has there been in this country such a talk-fest by near-farmers as during the last fortnight. If a man from Mars should drop on this continent, he would be forced to conclude that this nation stands on the verge of starvation because it has strangely omitted to develop a farming population and now, in a fancied extremity, it must mobilize from all kinds of ignorance and inexperience a multitude to do a farmer's duty to his country! Where is history, which has recorded the full competence in patriotic production of American farmers for a century and a half? Where is oratory, which has exalted the American farmer as the bulwark of the nation in all times of stress? Where is poetry, which has pictured the loyal hearts and the strong arms of men and women on farms as underlying national convictions of right and justice, and independence in material support of national life? All these things seem to have been forgotten and there has arisen all over the country a hubbub of grandpaternalism, urging not that Uncle Sam in his proper capacity should go on with his beneficent work of commanding that his farming nephews have a fair chance against imposition by the financial, manufacturing and commercial systems which have grown up during recent years, but imploring Grandpa Sam to look upon his farming offspring as feeble-minded and negligible and to create new methods and agencies of food production, which any person experienced in farming must consider as either impossible of immediate operation or permanently vain and unproductive.

MOBILIZATION.

WE are, of course, not trying to impeach the interest and spirit which prompt the current outcry for mobilization of fancied capabilities of food production, for this interest and spirit are genuinely patriotic and fundamental in our national strength. Our claim is that they are unconsciously unjust to the insight and capacity of the agricultural industry of the country and they worship notions and agencies which they mistakenly believe to be capable and practicable. They are half-truths and therefore most likely to deceive the unwise and unwary. The numbers of propositions which are burning wires and loading mail sacks are too great for even an attempt at a category. Their nature can, however, be indicated by a few references. The proposition to mobilize agricultural labor by accepting farm work as a patriotic service equal to military enlistment is sound and true, but it is linked with the mobilization of inexperienced people to be marched into the country and to be endowed by the government with materials and machinery to grow crops of which they know nothing—which is foolishness. To help wise and thrifty farmers to emerge from a burden of debt, at interest rates which are unwarranted and incapable of payment, is a long step toward national

competence, but to stake a throng of people who have only the physical semblance of farmers in the number of their arms and legs is silly grandpaternalism, and the more you mobilize of such the worse for the national strength. To help those who know land and the uses of it to bring larger areas under crop immediately, if the judgment of such men is that they can come through with it, will increase desirable production, but to exhort average persons to farm vacant lots in a town or to take up sections of desert land, is to invite either small or large catastrophes, as the cases may be. All these fallacies which are now being so widely exploited proceed upon the ancient error that the most important thing of the farm is the land. Adam thought so when he lived in the garden: he changed his mind when he homesteaded outside. The most important thing on the farm is the farmer.

AGITATION.

IN spite of the restrictions which we place upon the current agitation of the subject of food production, it will in the main accomplish its purpose, but not in the ways so glowingly anticipated. Though its exhortations are largely actuated by lack of confidence in the Lord God and in his chosen servant, for this line of activity, the American farmer, the harvest will come in largely increased volume. The data upon which shortage of food supplies for home use and export are predicated, are largely unwarranted. Departures from the steady increase of food production are but seasonal accidents, except in animal deficiencies which cannot be so soon recovered. The alarming condition of winter wheat reported last month has probably already been fully met by improved weather conditions and increased sowing of spring wheat. Prediction of shortage in summer crops, which will not be planted until next month or later, is gratuitous nonsense, if not actually impious, for the Lord's promise of seed time and harvest no crop statistician has a right to discount. Nor has any agitator, even through honest patriotic feeling, a right to take the ground that the American farmer is not sufficiently onto his job to get all the crops he can for the high prices which will prevail. It is perhaps the disrespect to the alert and capable farming industry of this country which nettles us most in the copious current discussion of food production. All concede that ample food supply is the principal thing in the present emergency and yet, so far as we have noticed, no notable assemblies of actual farmers have been called to resolve what can and should be done and how to do it. We have seen no note of action by national agricultural organizations, of which there are several very large and influential ones in this country, to set forth the patriotic and practicable effort which their constituencies should make. All we get by wire or mail are proclamations by near-farmers and non-farmers outlining public policies and duties which, if they could be achieved, would put the legitimate and immensely capacious farming industry out of business. But of course they cannot be carried out because they are largely visionary and fallacious. Two things which will work automatically, doing their own mobilization and agitation, are these: 1. Present prices are a spur to production to the limit of capacity. 2. Present prices are a check upon consumption to the limit of endurance. And there you have the right and left flanks of the food forces of the country!

THE PRESIDENT'S APPEAL.

AFTER being buffeted by the winds and waves of false farming doctrines, it is a great joy to hear the voice of the only one who is now in authority among us and whom all the world, except our mistaken enemies, now calls great and sincere and a friend of mankind. In his appeal to all classes to embrace patriotic duties, President Wilson thus presents a genuine agricultural exhortation:

I take the liberty of addressing this word to the farmers of the country, and to all who work on the farms: The supreme need of our own Nation and of the nations with which we are co-operating is an abundance of supplies, and especially of foodstuffs. The importance of an adequate food

supply, especially for the present year, is super-
relative. Without abundant food, alike for the
armies and the peoples now at war, the whole
great enterprise upon which we have embarked
will break down and fail. The world's food re-
serves are low. Not only during the present
emergency, but for some time after peace shall
have come, both our own people and a large pro-
portion of the people of Europe must rely upon
the harvests in America.

Upon the farmers of this country, therefore, in
large measure, rest the fate of the war and
the fate of the nations. May the nation not
count upon them to omit no step that will in-

crease the production of their land, that will
bring about the most effectual co-operation in the
sale and distribution of their food products?

The time is short. It is of the most impera-
tive importance that everything possible be done,
and done immediately, to make sure of large har-
vests. I call upon young men and old alike and
upon the able-bodied boys of the land to accept
and act upon this duty—to turn in hosts to
the farms and make certain that no pains and
no labor is lacking in this great matter.

Such an appeal needs no effort at enforce-
ment. It places the farm and the farmer in
proper relation to patriotic public service.

Winter-Growing Cover Crops.

To the Editor: My thought for this fall is to
either sow vetch or barley in my young orchard,
harrowing this in and letting it stand in the
spring just as long as possible before plowing
under. Or, possibly earlier in the season, plow
some ridges and then let the growth continue
until a proper height and irrigate and turn it
all under. I would like your opinion on this.—
J. C. A., Stockton.

Your plan for winter-growing cover crops is
one which we are almost continually urging in
these columns with much detail of successful
practice. Rye is, however, often better than
barley to grow with vetch because it is a surer
winter-grower and more likely to go straight
ahead even if the soil gets very cold and wet.
But do not let the crop grow too late in the
spring or you will lose too much moisture and
get the ground into bad shape, which will worry
you all summer.

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Cucurbits for Intercropping.

To the Editor: I have two small orchards; one
has trees planted in 1915, the other trees planted
this spring. The ground is in good condition,
level, and could be irrigated. I have been think-
ing of growing pumpkins in both pieces. Would
this take from the soil any vitality that other-
wise would go into the trees? I do not want to
in any way stunt the growth or development of
the trees.—Planter, Stockton.

The cucurbits as a class (pumpkins, squashes,
melons, etc.) are perhaps the most innocent of
injury to trees and soil of all the intercrops which
can be grown in young orchards. What they
take from the soil (except water) is practically
negligible and probably largely returned by their
own litter. Their use of water is very large, but
they partially atone for it by reducing loss by
evaporation through the sun-shade which they
spread over the surface. But the profit in growing
them is limited by their low selling value, which
also limits the distance they can be profitably
hailed. In a young orchard they are also ob-
jectionable because they make it almost impos-
sible to keep track of gophers, when these pests
are abundant, and some trees are almost sure to
be lost by them. Of course, if you have stock
to which the crop can be profitably fed, the in-
ducement to take chances with it is greatly in-
creased.

Feed from Rough Lowland.

To the Editor: I wish to grow cow or "hog-
off" feed of some kind on several acres of rich,
moist bottom land with considerable fallen tree
growth, with some open spaces for sunlight and
not much brush. I have no time to clear at pres-
ent. Would beets or pie-melons be likely to do
or what would you suggest for a try?—R. D. K.,
Tehama county.

If you cannot get in to cultivate, we doubt if
you could ever find your beets and pie-melons in
the mass of man-high weeds which such wild river
bottom is apt to send up. And if the land is
likely to do that, and there is not too much shade,
you have a gambling chance of smothering the
weeds by scratching in a broadcasting of "gyp"
corn or Sudan grass in the hope that it will
smother the weeds. In places where you can cul-
tivate the weeds out as they start and where
there is sunlight enough, you could get some tre-
mendous stock beets and pumpkins. But between
the shade and the weeds the situation does not
look very promising to us except as a park for
stock to lie in the shade and fight flies. If any
reader knows better let him go to it as part of
the preparedness program to which we invited
all to contribute last week.

Strawberry Aphis.

To the Editor: My strawberries, which are just
beginning to bloom freely, are covered with some
kind of aphis. Will they injure them? If so,
what can I do for them?—W. D. C., Stevinson.

Although the strawberry aphis cannot be
counted one of our great pests, it is capable of
distressing the plants considerably—especially
early in the season before its natural enemies,
lady birds, etc., get really busy. It should be
checked by spraying with kerosene emulsion or
tobacco extract, properly diluted, using a nozzle
which can be pushed under the foliage to shoot
a fine spray from below. If this is done early, as
soon as the pest appears, the chance of reducing
it is greatly increased. It will also be necessary,
probably, to repeat the treatment.

Poisoning Johnson Grass.

To the Editor: Noting mention, in your issue
of April 7, of the use of arsenite of soda for
Johnson grass, I wish to ask if this may be used in
a two-year-old orchard? I have perhaps an
acre of it in one place and a few scattered patches
in a 12-acre peach orchard. I have weed-cut
some years, but in rush of other work have not
succeeded in destroying the grass.—H. D., Marys-
ville.

We mentioned it in connection with an inquiry
for cleaning ditch banks, but we did not com-
mend it, because of the danger of killing other
plants to which it might be carried by water.
The same warning applies with greater force to
land set with fruit trees. There is no doubt of
its killing Johnson grass if enough is applied to
wet the ground deeply, but it will also kill all
other plants rooting in the same ground—trees
and all. Besides, arsenic compounds remain in
the soil for a long time and may kill the land
for years. It is a good weed-killer for walks
or roadways which are to remain clean, but not
for land which is expected to grow things.

Blister Mite of the Pear.

To the Editor: I am sending two diseased pear
shoots, from trees three years from bud. These
trees grew well the first year. Last year I no-
ticed the spots on the leaves, but most of the
trees made a good growth. This year they are
much worse and have swellings on top of shoots
as you can see by sample. What is the cause and
the cure?—S. L. P., Cordelia.

The raised patches or spots on the under sides
of your pear leaves are caused by the "blister
mite." The swellings of the twigs are not caused
by the insect. They seem natural to the pear;
at least, they have never been accounted for as
a diseased condition or the work of a pest. The
best treatment for the blister mite is spraying
with lime-sulphur when you see the buds swelling
and before green color appears. The female mites
hibernate under the bud scales and come out as
the swelling of the buds lifts them, and spraying
then cuts off their progeny. It is now too late
for such effective treatment. You may get some
of the pests by blowing fine sulphur on the damp
foliage.

Covering Pruning Cuts.

To the Editor: I planted young apricot trees
in February. They seem to be growing all right,
but several of them have started to split at the
pruning cut. What is the proper thing to do
with them?—A Subscriber, Los Altos.

The little sketch seems to indicate that you
may have left a little too long a stub above the
bud from which you wished to get growth. If so,
cut again nearer—say one-quarter of an inch
above the shoot—and cover the wound with graft-
ing wax or a little thick paint which will not
run down the bark. This will prevent checking
and the wound will soon bark over.

OUR READERS INVITED TO CRITICISE.

Here is your chance to talk back at our
editors! You may propose your ideas on
agricultural subjects, air your grievances,
criticise Pacific Rural Press articles, or say
anything you want to within the law. Just
tell it in less than 200 words and we will
print it without assuming responsibility.
We want the page devoted to this to be a
free expression of our readers' minds. Send
us your tummyaches or the remedies for
other people's.

Planting Dormant Potato Seed.

To the Editor: About February 15 I planted
40 sacks of "best seed potatoes"—at least that
was what I ordered. They are coming up only
now and then a hill. The ground was in perfect
condition and I begin to think they must be cold
storage or frozen before they sent them to me.
It's a big loss to me and I wish you would explain
the cause of it.—Planter, Sacramento.

Whether the seed potatoes were actually frosted
by too low a temperature in storage or not, we
cannot tell from the pieces which you send after
lying in the ground since February 15. It is,
however, clear from the condition of the eyes,
which can still be seen, that the seed was not
in proper condition for planting. Whether the
seed comes from cellars or from commercial cold
storage, it should be exposed to light and heat
for two weeks or so before planting to start
the eyes into green sprouts, or at least to start
them a little, before planting. This is always
desirable and especially necessary when planting
early when the ground is cold. Planting too soon
after storage is probably the trouble.

The Black Peach Aphis.

To the Editor: I am sending a peach twig in-
fested with small bugs. Are these the tree louse?
What is a good remedy to control these bugs?
They are spreading from tree to tree. I would
like also to know how to kill black aphis on small
poplars and rose bushes.—L. C. N., Kingsburg.

You have the black aphis of the peach, which
is a particularly bad pest because it attacks the
roots as well as the foliage. Spray at once and
repeat the treatment several times probably, using
one pint of 40 per cent nicotine or "tobacco ex-
tract" and one pound of laundry soap to 100 gal-
lons of water. Make a little basin around the
root crown and pour in enough of the same dope
to soak well down among the main roots. The
lice on the rose and the poplar are not the same
as on the peach, but you can use the same spray.
In the case of the rose and poplar, however, you
need not treat the roots.

Probably Not Ants.

To the Editor: We are bothered by red ants
eating up eggplants and other vegetables when
they are first planted out. Is there a simple rem-
edy?—W. S. C., Lindsay.

It is not usual for ants to eat living plants.
They generally visit them to get honey dew from
plant lice, etc. Such injury is generally done by
flea-beetles, which are about as hard to see as
fleas are, for they are about as good jumpers.
Mix equal parts of lead arsenate powder and
flour, put in a cheesecloth bag and shake over
the plants till they look dusty. Do it when
there is no wind and do not breathe the dust.

California Weather Record

The following rainfall and temperature record is fur-
nished the PACIFIC RURAL PRESS by the United States
Department of Agriculture Weather Bureau at San Fran-
cisco for the week ending at 5 p. m., April 17, 1917:

Blackberries and Intercrops Profitable.

[Written for Pacific Rural Press.]

The waste of high-priced land by getting only half of the crops it is capable of producing is what makes many farmers sell out and begin anew at other work. The man who gets the same profit from half the acreage has less interest to pay on his investment and gets more for his own time. H. Harris of Kern county is one who has come to realize this by joyful experience.

A few years ago he came to Kern county as a lifetime stock grower. He invested his money in a little piece of fruit land, hoping to improve it and sell, to get money enough to go into livestock farming on a larger scale than had been possible before.

Livestock farming for him has lost its glamour since he has done so well with fruit and vegetables. He is glad other people have livestock, because he has used many tons of stable manure on his 12½ acres of deep, sandy, loamy, decomposed granite soil.

Income \$2,500 from 12½ Acres.

Last year he took \$2,500 from the place, including about \$100 from young apricots, \$100 from young peaches, \$582.95 from blackberries and \$300 from strawberries. Grapes and blackberries were considered his best paying crops; but he also grew potatoes, tomatoes, other vegetables, chickens, and fruit.

Blackberries Paid Best.

Mr. Harris has both Crandalls and Mammoths on 2½ acres in the open. Mammoths were planted on an acre a year ago last spring, this variety being preferred because the Crandalls are just ripening when Mammoths have passed. The earliest varieties pay best, for they are sold fresh on the Bakersfield market every morning. Crandalls are alternate bearers for him also.

The highest price received last year was \$1.65 per tray of fifteen pint boxes. The lowest was 75 cents. Mr. Harris has been able to sell his fresh berries at 15 to 25 cents more per tray than those shipped in from Los Angeles. He has been working the home market for five years and is there himself every morning for six months of the year. Monday morning being the principal market day, Mr. Harris misses the Sunday leisure he would like, for he must get ready on Sunday for next morning's rush. The work requires three or four helpers all summer.

March and April are the best months for planting, according to Mr. Harris; but if you are not fixed to water them, better not plant at all. The ground is well manured, plowed deep, and worked down fine. Rooted tips are planted about three inches deep, preferably six feet apart in rows eight feet apart. They are watered at once, and again every two weeks all summer and sometimes oftener, for the roots should be encouraged to go deep.

The water lasts twice as long if you harrow and then cultivate after each irrigation, as if you neglect the harrowing. The soil is too wet two days after irrigation to cultivate, but the harrow loosens the surface and prevents much evaporation until the ground is dry enough to cultivate. There is nothing else to do the first

season; but during the winter, after planting, the vines are wound around a wire about three feet high, fastened on posts about three rods apart. A good crop is obtained in the second season, and twice as many the third season.

During ripening, which lasts about six weeks following June 1, the vines are irrigated at least once per week. Water is applied successively during the night to rows picked the preceding day. A furrow each side of the row is all that is needed; and this permits picking the day after irrigation, in emergencies. New vines are growing while the crop is being picked. For this reason and to avoid possible disease spreading from old canes to new ones, the old canes are cut off at the ground with pruning shears as soon as the crop is off. This enables the pruners to take out the twisted mass of old vines without injuring the young ones, as it would if they were allowed to intermingle till winter.

Apricot Blossom and Twig Blight and Sour Sap.

(Continued from first page.)

ing, a spraying with lime sulphur 1-25 may be of value in preventing the blossom and twig blight caused by Monilia, although in most cases this infection seems to be dependent upon frost injury. For spraying later in the season to prevent brown rot of the fruit, we do not yet feel safe in making any recommendation, since the apricot in our climate seems to be extremely susceptible to sprays at this time, and, furthermore, any injury to its appearance makes the fruit unsatisfactory to the canner and dryer. With young trees, that is those from one to five years of age, the great amount of winter injury which has taken place in the last two or three seasons and which shows itself in the form of sour sap and gumming, should receive the careful consideration of every grower. We believe that a heavy coating of whitewash applied about November 15 and renewed, if necessary, during the winter, is the best preventive of this trouble. It is also true in many cases that trees which have made an exceptionally vigorous growth on account of moist soil or late irrigation are especially susceptible to this. On the other hand, trees which have been weakened by neglect may also be affected. Both conditions should be guarded against as much as possible. What has been said about apricots in this connection applies equally well to prunes, cherries, walnuts and other trees, even including pears and apples.

WHITEWASH THAT WILL STICK.

We gave recently the recipe for a whitewash used by a grower at Yucaipa. The Placer Farm Bureau Monthly says that the following mixture has remained in the trees on the Frank Jordan place throughout the winter: 5 pounds rock lime (fresh); one-half pound salt; one-fourth pound sulphur.

While the lime is slacking add the salt and sulphur. If rabbits have access to the young orchard add 2 ounces of bitter aloes to the whitewash.

Be On Your Guard

RED SPIDER and MILDEW are active NOW. Every bit of your CROP will be needed THIS YEAR. Are you doing all YOU can to save it?

"A Puff in Time Saves the Vine"

DRY SULPHUR applied with

The American Beauty Dust Sprayer

will positively destroy RED SPIDER, MITE and MILDEW on vines and trees—GRAPE, PRUNE, ALMOND, CITRUS FRUITS, etc.

Mr. Orange Grower

DO NOT let your red spiders multiply. Save time, expense, and fruit by "getting them" before they "get you." DO YOU KNOW how much damage they cause in YOUR groves? DUST NOW. Get an American Beauty at once. The BEST DUST SPRAYER that money can buy.

FOR SALE BY ALL PROGRESSIVE DEALERS. If YOUR dealer cannot supply you, send us \$11.00 for a

vineyard size, or \$13.50 for an orchard size machine, and we will send you an AMERICAN BEAUTY DUST SPRAYER, all charges paid. Try it a week. If it is not entirely satisfactory, return it at our expense, and we will cheerfully refund your money. Send for circular and price list today.

Peach Statistics for Sutter County

[Written for Pacific Rural Press.]

We present below a table of acreage and age of different varieties of peaches in Sutter county, carefully compiled by a reliable authority last winter. It will be seen that drying peaches are not popular there; but clings have been planted rather heavily. A considerable drop

is noted in the acreage planted a year ago. Such tables, accurately compiled, would throw much light on the future of the peach industry if they covered the peach producing sections. Of the total 4,309 acres in peaches, a good bit over half are four years old or less:

PEACH VARIETIES, AGE, AND ACREAGE.												
Variety.		Years Old and Acreage.										
		1	2	3	4	5	6	7	8	9	10	11 12

Tanglefoot for Mites and Red Spiders

[Written for Pacific Rural Press.]

Tree tanglefoot in a wide strip around the trunks is recommended by J. B. Hundley of Yucaipa to keep the brown mites (bryobia pratensis), often called red spiders, off from the deciduous trees they infest.

"I have seen tanglefoot bands on which there were four or five layers of bryobia and others crawling over the tops of them," says Mr. Hundley. These mites generally hatch out on the trees also, where they feed on the young leaves, and of course they must be treated with sulphur, as tanglefoot would not catch them.

Farm Adviser J. W. Mills of Solano county points out that common wild morning glory is a great breeding host for both this and the real six-spotted red spiders. This and other weeds and grasses may be the breeding places of the mites observed by Mr. Hundley. At any rate, tanglefoot is cheaper than mites on the trees and should be applied early where there is danger of infestation.

DON'T LET PEACH APHIDS RUIN CROP.

[Written for Pacific Rural Press.]

At this season, black peach aphids are emerging from their winter quarters in the ground and climbing peach trees to feed on the young leaves and fruit, especially low on the trees. They curl the leaves and spoil fruit for market. Then it is too late to save anything but the remains. The adults are shiny black, but the young are more numerous and are brownish. Spray with nicotine sulphate, one pound per 200 gallons of water, to which has been added ten pounds of liquefied fish oil soap, or one gallon of cresol soap, to make it spread. The earlier this is done the more fruit will be saved and the more bugs can be reached before the leaves curl over them.

WATERING TERRACED ORANGE TREES.

[Written for Pacific Rural Press.]

Last summer, while Manager W. N. Barlow of the H. H. Ford orange ranch in San Bernardino county was in the East, the men used lots of water, but it didn't work. There are sixty-five acres of trees planted at the edge of steep terraces. These trees were dry and water was scarce when Mr. Barlow returned early in July. Two furrows were plowed above each row pretty close to the trees and water run through them slowly. The soil is decomposed granite, in which the water soaks down rather than sideways; so the rest of the terrace was not easily cultivated after the irrigation. The trees were in good shape by the end of July. When the flats were plowed this spring, the unirrigated ground was still hard and tough "like rubber."

Lemons are excellent in the treatment of low fevers, biliousness, rheumatism, liver complaint, and coughs. Lemonade will relieve the feverish thirst in sickness.

Security Orchard Ladder

(of course it costs more)

Galvanized sheet steel riveted to step and machine-wrapped around the stile adds super-strength where strength is most essential.

Step mortises eliminated. No chance for weakening under any man's weight.

Much to Learn, University Farm Picnic.

[Written for Pacific Rural Press.]

Five thousand persons attended the University Farm Picnic in 1915. Over 15,000 attended in 1916. The student body met visitors at the gates and showed them whatever on the farm they wanted to see. Every department had exhibits illustrating the best things learned during the previous years. Men in charge answered visitors' questions. That's what they were there for. There was all kinds of entertainment and fine speaking, too.

On April 28, 1917, the University Farm faculty and students will welcome all comers to a picnic the equal of which has not been seen before, using all their past experience to make this the best ever.

Just ask the fellow that jumps aboard your rig at the gate to take you where are the experiments you are most interested in. Don't miss anything. Get there at 8 a. m.

The following items of special interest are clipped from the program as printed in the "University Farm Agricola":

8 a. m. to 6 p. m.—Children's Playground open with attendant in charge.

8-11 a. m.—Visitors received by Reception Committee and shown points of interest on the Farm.

10 a. m.—Stock Judging, Pavilion—Gold, silver, and bronze medals awarded. Classes of horses, hogs, dairy and beef cattle. Address by well-known judge.

10 a. m.—Demonstrations for Visiting Agriculturists—All experiment plots open to inspection and demonstrations given. All stock barns and stock on display with attendants present explaining the essential points of that particular division. The entire Farm an "open house."

11 a. m.—Speaking—Governor Stephens; Senator A. H. Breed; Jack Hunsaker, A. S. U. F. Representative; K. A. Ryerson, A. S. U. C. Representative; Dean H. E. Van Norman, presiding. Davis Band.

12 to 1 p. m.—Lunch—Visitors should bring lunch; coffee and cream free.

1 p. m.—Women's Entertainment—Auditorium Building—Lectures, demonstrations, discussions, problems in home economics, card parties, exhibitions, etc.

3 p. m.—Parade—Greatest livestock parade in the West. Each division to be represented by a float. To form at Dairy Barn and circle around the athletic field in front of the Governor's reviewing stand and park for thirty minutes on field, so students in charge of floats can explain the essential points of that division which he represents.

6 p. m.—Open air cafeteria near dining hall.

8 to 12 p. m.—Entertainment.

Tractor demonstrations and illustrations of the effect of speed on plowing, best methods and uses of water, feeding and care of livestock, poultry, and orchard trees, preparation of seed bed—anything you care to ask about.

FIELD CROP SUGGESTIONS.

After his five acres of oat hay are cut, G. D. Mead of Stanislaus County waters the ground, plows it, and raises a crop of casabas or beans.

E. O. McClure of Santa Ana grew 20 acres of barley last winter which was mowed and fed green this spring to his purebred Holsteins; and a crop of beans is now enriching the ground while promising to enrich its owner.

It will soon be time to plant Sudan grass.

It is now time to test seed corn. Ground wasted by poor stands due to poor seed used by some farmers would pay the wages of a man or two.

A family garden will give much better vegetables than can be bought at many places.

It will pay to pay a high price for fresh, pure viable seed rather than to be "penny wise."

The area devoted to the cultivation of tobacco in the United States in 1915 was 1,368,400 acres. The production of tobacco was 1,060,587,000 pounds, and the farm value on December 1, 1915, \$96,041,000.

SELF-OPENING GATE.

To the Editor: Please give a description of a self-opening gate for farm use that could be made on the farm.—H. H. P., Sebastopol.

Who of our subscribers has one that is not patented?

Thirty-five fig growers met at Ceres last Saturday and agreed not to contract their fruit until after the next meeting, June 9.

We are facing a world wide food shortage. For the sake of the hungry world as well as for the good of your bank account you ought to make every foot of your land produce its utmost. You can't possibly do this without fertilizing. Germany's crop failures for the past two years have been largely due to her inability to secure proper fertilizer materials.

GOLD BEAR FERTILIZERS

Are made from Animal products that contain the elements necessary to meet California soil conditions and crop requirements.

PURE ANIMAL MATTER

What Kind of Foodstuffs to Grow.

[Written for Pacific Rural Press.]

President Wilson has called on the farmers of America to produce all of the foodstuffs possible. He has called on the wives of all men and the cooks of the cities not to waste any, for we must not only feed ourselves, but we must supply the European nations which face the possibility of starvation like Belgium. He has asked all middlemen to forego unusual profits.

As there seems an assured market for food products, it is scarcely necessary to urge farmers to make the most of it. The main question is concerning what kinds of foodstuffs should be planted at this late time of year.

To answer this question, a survey is being made in the two weeks beginning April 16 of the crop conditions, possibility of increased acreages, livestock conditions, etc. This survey is a succession of hearings in all food-producing counties of the State by members of the College of Agriculture, State and County Horticultural Commissioners, other State officers, and U. S. Department of Agriculture investigators. Each forenoon a limited number of the best posted men in each district are asked to advise the board of inquirers in that district. In the afternoons the State food and resources are discussed in open meetings.

Inquiries to be held after date of this issue are: April 23, San Francisco, Crescent City, Del Norte county, Placerville, Fresno and Susanville, Lassen county; April 24, Auburn, Hanford, Haywards and San Diego; April 25, Grass Valley, Visalia, Martinez and Los Angeles; April 26, Marysville, Bakersfield and San Bernardino; April 27, Fairfield and Imperial.

Meanwhile, Dean Thos. F. Hunt of the College of Agriculture has pointed out from tables prepared by Prof. M. E. Jaffa certain significant facts. The table shows "the value at the point of consumption of suitable foods for the average family of five persons, based on present prices."

The maximum per family is totaled at \$650.55 or \$0.356 per person per day. Over half of this is classified as "protein foods," milk, meat, eggs, and beans. Meat is nearly a third of the total. Milk is over one-eighth of the total, eggs a little less, and beans \$2.40 out of the \$650.55. Flour, cereals, macaroni, rice, and potatoes total less than the milk and slightly less than the vegetables and fruit.

The lesson is that unless Americans radically change their food habits, by far the greatest demand will be for meat and milk. This means not only careful breeding and rearing of animals, but, as Dean Hunt points out, the planting of greatly increased acreage of the sorghum grains and Sudan grass. He also points out that "about one-third of all the land plowed in the United States every year is planted to Indian corn. An acre of Indian corn has nearly twice the value of an acre of wheat for human consumption. Broadly speaking, Indian corn is used for the production of butter and animal fats."

California has proved her ability to raise Indian corn in the river bottoms and on the coast hills, not only for grain but for silage to keep our animals producing meat and dairy products when other feeds are less available.

SUPERS, DRONES AND SWARMING.

In answering a beginner as to when he must put on supers, and what to do about drones, and how to prevent swarming, the "Western Honey Bee" says:

"Supers for surplus honey should be placed on hives as soon as the bees begin to 'whiten the combs'—that is, as soon as new wax is being secreted, which indicates a free honey-flow.

"There is nothing which a beginner can do in regard to drones or to prevent swarming. Better let them swarm and hive the swarm, putting it in a new hive on the old stand, removing the old hive to a new place."

Ask the Man Who Has Used It

Nitrate of Soda leaves no mineral acid residues which may destroy neutral soil conditions. It does not require time to be Nitrated as do all other forms of Nitrogen. There is no risk of loss by Nitration, since it is delivered to growers already Nitrated. No matter how cold the season may be, time lost in Nitrating other forms of Nitrogen in your soil is wholly saved.

Chalmers 7-Passenger Touring Car—Price \$1350 Detroit

Daily You Will Find New Charms in This Chalmers

Some cars are noted for their comfort. Others are distinguished for their beauty. Others, for the strength of their chassis. But the Chalmers is an all around car. It has power, comfort, beauty, strength. All four.

Comfort

Picture a 122-inch wheelbase. With a front seat 41 inches wide, and a tonneau that extends from front to rear more than the reach of the average man.

Power

Imagine an engine that weighs 550 pounds. And turns up 45 horse-power. One horse-power for every 12 pounds of weight. Which with a total car weight of 3005 pounds means power ease on the hill. One horse-power for every 67 pounds of car weight.

Strength

Then turn over in your mind the extreme strength there must be in a car that is largely built of drop forgings, chrome nickel steel,

Lynite aluminum, crucible nickel steel and carbon steel.

All expensive metals. But placed in the Chalmers chassis for a specific purpose—to make it rugged and strong, though light in weight.

Such quality makes for durability and economy. For a thing made of good materials, always is well made.

Beauty

And a car made of the kind of materials you find everywhere in the Chalmers would be indeed incomplete without beauty and distinctiveness of lines.

See the high narrow radiator, the double cowl, the sweeping body lines, the finish that denotes hours of patience and care. And provides beauty, not for a day, nor for a month, but for years.

All the above means quality. The kind of quality you need in the car you buy and the kind of quality you GET in the Chalmers.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

MORE TRACTORS AND MACHINERY TO REPLACE WAR DEMANDS FOR MEN.

[Written for Pacific Rural Press.]

Have you had trouble getting satisfactory farm help and keeping the good workers? You will have more trouble from now on. Every tunnel on the railroads has two guards; every manufacturing plant is adding to its force enough guards to reasonably insure safety from plotters. Men have little trouble these times finding easier jobs than working for someone else on a farm. Every man who joins the army and navy makes it easier for the others to get what is generally considered a better job than being a hired man and sleeping out. Every horse used in the cavalry and every pack mule reduces the home supply.

We must face the facts and protect ourselves. When harvest comes, we must know that we have power to run our machines and arrangements made so that we require the fewest men possible to do the work. In the orchards and even the vineyards, we must get power in a compact form by which one man may do as much cultivation as several now do.

For Our Dairies, we need to provide mechanical power to cut our corn in the field and even haul it to the silage cutters. Instead of several men and teams with pitchforks to load and unload manure, we need ma-

nure spreaders and arrangements for loading them without the armstrong work which may be unavailable; and we need power to haul big loads to the field and distribute them, not in big chunks, but in a smooth layer over the fields so the manure may be readily available for bigger crops.

On Wet Bean Lands, we need power that we can depend on to get the land plowed and worked down fine at the earliest moment after the soil is fit. Even among potatoes and corn, the cultivation done two or more rows at a time, may save an extra man.

In Hot Weather, with mechanical power, we can keep on working without trouble with humanitarians. A shade over the operator of a tractor raises no condemnation as it often does over the driver of horses which might get too hot. Instead of feeding extra teams to shift in for the hard work and the night work, we can keep the tractor going if we take care of it.

With the war making labor and workstock scarcer and more expensive, those who have wanted tractors but thought they could not afford them, can now see easily where they cannot afford to be without one on a farm of ten acres or more.

Reliable tractors are now made in California or shipped over the mountains to us, of all sizes which have proved economical on all sized farms.

Like the automobile, the question in buying a tractor is not any longer whether its engine and transmission will stand the strains they are guaranteed for. The questions now are along the finer points of operation, convenient appliances, easy turning, and best size for individual needs.

As time goes on, we will find that we can use tractors in a multitude of ways that now seem inconvenient, for we will have to adapt operations to that need. Then we probably will find that we have really reduced the costs of production, however unwillingly we may have been forced to it.

The man without enough money to buy a tractor, if a farm owner may borrow from the Federal Land Bank at 5 per cent interest, enough money to buy tractors and labor-saving machinery. If a renter with a good reputation for industry and headwork, he can get his landlord to furnish the security for implements by which payment of the rent will be made more sure.

F. T. Robson of Berkeley has just placed an order for a 30-foot 12-inch Type C. H. C. Layne & Bowler turbine pump to be direct connected to a 15 h. p. motor for his ranch at Davis.

The Bean Spray Pump Co. offered their plant to the Government for any purposes required, and have been wondering whether to go after more orders for their tractors, spray pumps, and irrigating pumps.

Layne & Bowler PUMPS

EVERY Western rancher KNOWS that from his standpoint this is going to be the most prosperous year in the history of the country IF his water supply does not fail. Have you fully prepared to bring your crop thru with the greatest success? Make sure your irrigation facilities will not fail you at the critical time by installing a Layne & Bowler Pump. Don't wait. Prepare now. Our Catalog No. 25 gives full details. Ask for it.

ELECTRIC EQUIPPED MILK HOUSE.

[Written for Pacific Rural Press.]

Probably no better use can be made of the tank house on the average dairy than to utilize it for a milk room, provided it is located conveniently to the dairy barn.

On the Holstein breeding ranch of Gotshall and Magruder at Ripon the lower part of the tank house was finished inside with cement plaster to a height of about five feet, and the balance of the walls and ceiling plastered with ordinary lime plaster. A well drained concrete floor was laid; and an opening two feet wide extended along one entire side wall. A shelf two feet wide runs along the inside wall next to this opening for airing utensils, the opening being screened, and also equipped with board doors that can be fastened from the outside in rainy weather. The outside door and window are also screened to prevent flies.

The milk room is equipped with a separator and galvanized iron washing trough, steam for which is furnished by a small boiler that is located in a lean-to shed that has been added to the back of the tank house. Electric power is used for pumping and a small motor is used to run the separator. The room above the milk room is used for hired help; and above that is located the large water tank, allowing utilization of all the building for useful purposes.

MOTOR FOR COACHELLA IRRIGATION.

[Written for Pacific Rural Press.]

A wonderful alfalfa yield was secured by A. H. Smith on 45 acres of Peruvian in Coachella Valley where nothing would grow in summer without pump water. No other irrigation is available; but with a 35 h. p. motor costing \$5.70 per ten hours' run he gets 125 inches of water from the centrifugal pump. This covers five acres in a ten-hour day, penetrating the sandy silt two feet deep, as he has learned by digging after irrigation many times.

The well is 12 inches across at the top, and 700 feet deep. Water generally rises within 35 feet of the surface and pumps down not over 32 feet. The entire stream could be turned into one of the checks, which were 30x660 feet, and would run through in 30 to 40 minutes, but it is divided into two checks to soak the soil deeper. Even with such a stream, in July and August it is hard to give enough water and the alfalfa is more or less stunted by the heat. Weekly irrigation is needed, but the alfalfa gets only two irrigations per cutting.

POWER NOTES.

It is reported that one California tractor company cleared 100 per cent on its investment of \$1,000,000 last year.

Even a track type tractor is not proof against quicksand as evidenced by the big one in Merced County which had sunk until only the top, on one side, showed above ground. It was pulled out by another tractor.

To keep down the upkeep expense

of a car, have it thoroughly overhauled once or twice a season by someone who is thoroughly competent.

Bills in the legislature propose: Uniformed inspectors to enforce the State laws on the highways; red lights and flags on trailers; cars in the country must not be over eight feet wide; description of motor to be put on back of registration certificate to help prevent theft; restrictions on truck loads per inch tire width; lights must focus not over 42 inches above the road 75 feet

ahead; no racing on highways; no stop for repairs, etc., without pulling off to the side; no livestock on the highways except with attendants; taking another's car for a joy ride made a felony; accidents to be reported to nearest police head-

quarters; no baggage on left side of automobiles; protection at railway crossings; no defacement or alteration of identification marks of vehicles; no more than 10,000 pounds per load on a paved highway except where one article exceeds this, etc.

MAKE BIG MONEY PULLING STUMPS

Pull the stumps from your fields and replace them with big crops. Don't pay taxes on idle land.

The Hercules All Steel Triple Power Stump Puller

Pulls an acre of stumps a day. Pulls biggest stump in 5 minutes. Guaranteed against breakage for 3 years. 30 days free trial. Send name for book, free—and special low-price offer. Address: Hercules Mfg. Company, 912 25th St. Centerville, Iowa, U. S. A.

\$1150 F. o. b. Racine
Mitchell Junior—a 40-h. p. Six 120-inch Wheelbase

Mitchell
SIXES

\$1460 F. o. b. Racine
7-Passenger—48 Horsepower 127-inch Wheelbase

Twice as Strong To Give You a Lifetime Car

Here is a new reason for getting a Mitchell to drive on country roads.

In the past three years, John W. Bate has doubled our margins of safety. Now every important part—by test—has 100 per cent over-strength.

Over 440 parts are built of toughened steel. All safety parts are oversize. Parts which get a major strain are built of Chrome-Vanadium.

Gears are tested for 50,000 pounds per tooth. The springs we use—Bate cantilevers—have never yet been broken.

Several Bate-built Mitchells have already run over 200,000 miles. So it is quite unlikely that a man will live to wear a Mitchell out.

Extra Features

That over-strength, in our opinion, is the chief Mitchell extra. But there are many others.

There are 31 features in the

Mitchell which nearly all cars omit. Things like a power tire pump, a dashboard engine primer, ball-bearing steering gear, etc.

And this year's cars have 24 per cent added luxury—all paid for by savings in our new body plant. The Mitchell is now the luxury car of its class.

All Extras Free

All these extras come free in Mitchell cars. They are paid for by factory savings.

John W. Bate has spent millions of dollars in building and equipping this model plant.

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase and a highly developed 48-horsepower motor.

Price \$1460, f. o. b. Racine

Mitchell Junior—a 5-passenger Six on similar lines with 120-inch wheelbase and a 40-horsepower motor— $\frac{1}{2}$ -inch smaller bore.

Price \$1150, f. o. b. Racine

Also six styles of enclosed and convertible bodies. Also new Club Roadster.

It covers 45 acres. The one aim has been to build this one type of car economically.

His methods save us on this year's output at least \$4,000,000. And all that saving goes into extra values.

The result is extra features, extra beauty, extra strength. Cars built in other ways can't give them.

One Size—\$1150

Note that Mitchell Junior, with 120-inch wheelbase, sells for \$1150, f. o. b. Racine. You never saw such value in a fine car. Even this smaller car has nearly all our extras.

Go see these new models. See what these extras mean. You will not then want a car without them. If you don't know the nearest Mitchell dealer, ask us for his name.

MITCHELL MOTORS COMPANY, Inc.
 Racine, Wis., U. S. A.

General Agricultural Review

Field Crops.

Potatoes were quoted on the wharf in San Francisco early this week at \$5 per cental.

A government report says that the winter wheat crop is 50,000,000 bushels below last year's yield.

The Southeastern States are draining the Pacific Coast mills of their flour supply, and wheat futures are soaring in consequence.

Yolo county signalized April 10 as squirrel extermination day. Five hundred pounds of poisoned wheat was distributed among the farmers.

Millers are beginning to increase their prices on all grades of cleaned rice. Southern markets are reported firm.

A large area in the vicinity of Gridley, Butte county, is already planted to rice. In some of the fields the water was turned on last week.

Hay promises to be a scarce article this summer in the San Joaquin Valley. Some farmers are cutting their alfalfa prematurely in order to get feed for their stock.

The Turlock Merchants and Growers' Association will install an extensive bean cleaning plant in time for the 1917 crop. It will have a capacity of 1,500 bags per day.

A small shipment of new silver skin onions was in Los Angeles the past week from the Imperial Valley. They sold in a limited way at \$10 per cwt.

It is said the pool of the California Lima Bean Growers' Association will close May 10. After that date no more growers will be taken in for the 1917 season.

A few boxes of new summer squash was on the Los Angeles market in the past week from the Imperial Valley. They sold at \$3 per crate of four baskets.

Beet thinning is being actively prosecuted in the Oxnard district. The beets are said to be growing fine and the prospects are for a good crop.

A sale of 1,000 bags of Butte county rice was effected recently at \$3.45. The rice was very high grade, of the Waterbune variety, and the price obtained is said to be unprecedented.

The offering of buyers to contract lima beans of the new crop for 10½ cents per pound in Orange county, it is thought, will cause growers to put in a big acreage. Planting will commence May 1.

One hundred thousand tomato plants were shipped to Oxnard last week to be planted in that district to supply tomatoes for a new cannery that is now being erected at Hueneme.

Wholesalers announce an advance in price in all varieties of beans, the prices ranging from 10 to 16 cents per pound. Consumers will pay anywhere between 15 and 20 cents hereafter.

While the consumption of barley in California is estimated normally at 30,000 tons a month, it is believed there are less than 10,000 tons of barley stock in the State at the present time.

In many sections of California rice is largely replacing wheat and other grains as a stock feed. Wheat is bringing around 3 cents a pound, while rice, in the paddy, or husk, sells as low as 1½ to 1¾ cents.

Although the onion crop of Texas is two weeks later this season than usual, that State is beginning to send out shipments to relieve the country-wide shortage of the savory bulbs, which will send down prices.

Hay and other feedstuffs have been rising rapidly in price during the past month, and the end of the upward movement is not in sight. There has been a jump of about \$9 a ton in wheat hay.

It is reported from El Centro that many thousand acres of alfalfa will be plowed up in the Imperial Valley, and planted to cotton owing to the high price of cotton. The acreage of milo maize it is said, will also be large.

Reports from Redlands say that last Monday's rain there was .55 inch and did much good, as the ground was too dry to plow. Farming operations will now go forward. Another rain this week helped the growing crops.

The State Commissioner of Horticulture says that in both the lower and upper regions of the San Joaquin Valley grain crops are beginning to suffer. Except on river-bottom lands, the barley harvest promises to be light.

Early this spring a doctor in the Imperial Valley sowed peas in his grapefruit orchard, intending to use them as a cover crop. A chance buyer bought the pea crop at a good figure. The stripped vines will be turned under to serve the original purpose of supplying a fertilizer.

A badly needed shower was had throughout southern California Monday of last week, doing much good, as but little rain was had during March. Crops were badly in need of moisture and the rain will greatly help both the staple crops and vegetables.

In the Arroyo Grande Valley, near Salinas, large fields of horse beans are badly infested with aphids. The cost of \$7 per acre for spraying, the remedy recommended by County Horticultural Commissioner Christensen to combat the pest, will not be borne by some of the farmers.

A number of farmers along the Sacramento river are contracting with the representative of a large New York seed jobbing house to grow seed to supply the seed shortage. Since the outbreak of the war little or no seed has been received from Europe, heretofore the main source of supply.

The high prices now paid for Egyptian cotton is attracting attention to the possibility of growing this staple in the San Joaquin and Sacramento Valleys, says the U. S. Department of Agriculture. The success of cotton growers in the Imperial and Colorado valleys and the Palo Verde district seems to warrant the experiment.

Approximately 13,000 crates of onions were included in the cargo of the steamer Sierra, which arrived in San Francisco from Australia last week. This is the second and heaviest shipment to arrive this season and is to be followed by other large shipments. A portion of the shipments were sold ahead at prices ranging from \$5 to \$7 per cental. Practically all of the remaining amount was sold at \$7 to \$8 per cental before it was unloaded from the steamer, subject to inspection and delivery.

Deciduous Fruits.

Orange county Horticultural Commissioner Bishop says the apricot crop promises to be a big one.

Already 99 per cent of the Japanese prune and apricot growers have joined the Prune and Apricot Growers' Association.

An advance in the price of dried peaches, ranging from one-quarter to one-half cent per pound, was announced April 10 by J. F. Niswander, vice-president and general manager of the California Peach Growers' Association, Inc. Eastern trade is buying heavily of new peeled peaches.

State Commissioner of Horticulture G. H. Hecke has warned all

Heap big mileage!

Rubber!

Real rubber—none of that puttyfied, near-rubber look to Savage Tires.

The tough, grips-the-road tread—the resilient, shock-absorbing cushion—the strong, yet flexible, never-crack sidewall—

Every rubber part of Savage Tires is made of live rubber, the finest for the purpose that money can buy.

Stock always fresh. Sold from factory to you through our own distributors—the middleman's profit put into higher quality.

THE SAVAGE TIRE

county commissioners to guard against a serious insect pest infecting the Japanese persimmon. The insect is a new species of codling moth. The larvae of the moth feed on the fruit of the persimmon.

Howell D. Melvin, chairman of the finance committee of the Prune and Apricot Growers, has kept in close touch with the operations of the prune and apricot growers and feels sure that the organization will be able to secure its 75 per cent of the entire acreage by May 1. But the \$10,000 pledged must be raised. The money is being used as fast as it is taken in.

Citrus and Semi-Tropical.

The fig growers of Stanislaus county are well organized. Ceres has just added a branch with a membership of 35.

The California Ripe Olive Company intends to operate its Oroville plant on tomatoes throughout the coming summer.

J. A. Langan has sold his nineteen-acre orange grove, known as Victoria Hill, overlooking the Victoria golf links, Riverside, for \$40,000. The purchasers are E. B. Blinn and F. H. Gilchrist of Pasadena.

Congressman Randall has introduced a bill in Congress to amend the Underwood tariff law so as to increase the import duty on lemons and other citrus fruits from one-half to one cent a pound. Our citrus growers fear that after the war they may suffer from competition with cheap Sicilian and Italian lemons under the present half-cent tariff rate.

There are 5,027 acres of almonds in San Luis Obispo county, bearing and non-bearing.

At the last meeting of the Live Oak and Pennington Almond Growers' Association W. E. McMurry was elected president, H. Schidler secretary, and L. A. Ballard delegate.

The first loquats of the season made their appearance on the Los Angeles market last week from Orange county. They were a very nice lot. Fancy sold at 12c per pound and the small at 5c per pound.

News comes from San Bernardino of the successful shipping of two cars of oranges by the San Bernardino County Fruit Exchange to England. The fruit sold at \$6.37 per box and netted \$3.85 per box f. o. b.

Grapes and Berries.

No general manager has yet been selected by the directors of the California Associated Raisin Company.

Alameda county shipped the first chest of ten drawers of strawberries of the new season to San Francisco, April 5. They sold quickly at \$1 per drawer.

The ninth annual California Raisin Day Festival will be celebrated at Fresno April 30. Elaborate preparations are being made to establish a new record for enthusiasm and attendance. Governor William D. Stephens has promised to be present and Mayor Rolph of San Francisco has been invited. Excursions to Fresno are being arranged for from many of the larger cities of the State, and large delegations are expected to take part in the festivities.

The decisive defeat in the State Assembly last week of the Rominger liquor bill, which sought to eliminate the saloon and strong drink in this State, but which essayed to protect our grape-growing interests by permitting the consumption of light wines at the family table and in hotels and restaurants, makes the passage of any form of regulative liquor measure by the present Legislature very doubtful.

The first strawberries of the season were shipped from Florin to Sacramento last week. Their ultimate destination is Portland, Ore.

The Florin district grows the bulk of the berries shipped to the Northwest.

Opening prices for the 1917 crop of layer and cluster raisins, as announced by the directors of the California Associated Raisin Company, are 3/4c higher than the opening prices in 1916, but equal to the 1916 prices as established following the rains last October.

Reports from San Bernardino say that by a unanimous vote the landholders of Victor Valley have determined to form an irrigation district embracing 30,000 acres of land north of the San Bernardino Mountains for a reclamation project costing \$2,000,000.

Friction

Is the Problem Solved in

Hudson Super-Six

This is to give you a clear understanding of what the Super-Six motor means.

This is why it holds unquestioned the leading place in Motordom. Why it won all the worth-while records. Why it stopped the trend toward Eights and Twelves. And why it gave supremacy—perhaps forever—to this new type of a Six.

What Friction Does

Motion causes friction. You know this in farm machinery. It is friction that finally destroys it.

In a high-speed motor the vibration makes friction a big problem. A large part of the power is consumed by it. The motor's endurance is limited.

So the chief problem in motor car engineering has been the reduction of friction.

Sixes Disappointed

The Six-type was adopted to lessen this vibration. The Light Six, with small bore, was made to lessen it further. But the highest attainment in a Light Six proved a disappointment. Motor friction was not reduced as engineers had hoped.

So some leading makers, including the Hudson, started tests with Eights and Twelves. It was hoped that twin motors, set at angles, would solve the friction problem.

Then Came This

That was in 1915. Many engineers thought the Six type was doomed. That the V-types would displace it, as they had in certain cars.

But in that year Hudson engineers invented the Super-Six. In December, 1915, we were granted patents on it.

Tests proved that this invention added 80 per cent to the efficiency of the Six. And it did that solely by reducing friction beyond any other type.

All Records Won

Last year, in a hundred tests, the Super-Six won all the stock-car records which can prove a motor's value. It won the records for speed, for hill-climbing, for quick acceleration and endurance.

It broke the 24-hour endurance record by 32 per cent. It twice broke the transcontinental record in one continuous 7000-mile round trip.

So, in performance and endurance, the Super-Six has no rival. And that is due to the fact that friction is reduced almost to nil.

The Economy Car

This endurance will probably double the life of the Hudson car. The reduction of friction saves immense power waste.

In addition, we this year add to the Hudson a wonderful gasoline saver.

So the Hudson Super-Six means economy to you. It means a daily saving—in the long run, a very big saving.

It means pride in your car. The Super-Six owner knows that he rules the road. And, in beauty and luxury, the car stands out as a master-piece in any crowd.

You can have all this, and still save money, because of the Super-Six economies. These are things to consider well when you buy a car to keep.

If you don't know the nearest Hudson dealer, ask us for his name. Let him show you all the ways in which this master car excels.

HUDSON MOTOR CAR COMPANY, DETROIT, MICHIGAN

Age and Color Test for Butterfat

To the Editor: Does bluish looking milk indicate low percentage of butter fat? Will a cow increase the percentage of fat in her milk as she gets older?—A. H. G., Reno, Nev.

[Answered by Authorities.]

R. S. Roy, Marin County Cow Testing Association:—Bluishness indicates low butter fat. Milk usually continues to grow richer as the cow advances in age.

I. M. Bomberger, Sec'y Cow Testing Dept. Stanislaus Farm Bureau:—Yellow milk is generally richer than bluish-white milk, because the breeds which on the average yield the highest percentage of butter fat happen to produce yellow butter fat. When the source of milk is not known, the color test is of little value. Three per cent Guernsey milk would usually be more yellow than a Holstein cow's milk testing higher. If you should remove half the skim milk from a Holstein's milk, leaving the balance twice as rich as usual, the color would be affected very slightly. An elephant's milk is said to be bluer than any cow's milk; yet it contains 11 per cent fat. I have found that some heifers give poorer milk the first and second lactation period, but am not sure it was because they were younger.

Allen Thompson, Sec'y Tulare Cow Testing Association:—From my personal experience in testing, I find that color is not a sure sign of high or low fat content. I think that the age of a cow has nothing to do with the fat content of her milk. However, a cow's milk is richer late in her lactation period.

E. A. Kirk, Sec'y Glenn County Farm Bureau:—We believe that bluish color of milk indicates low fat content. One of the leading creamery operators of this county says emphatically, "Yes."

B. Kaehler, Tester Orland Cow Testing Dept.:—Bluish looking milk right after it is drawn from the cow, indicates a low test, but the cow may produce much fat if she gives much milk. Yellowish or highly colored milk does not always indicate high fat percentage. After a cow has reached the age of maximum milk flow, the flow diminishes at an increasing rate, but there is no extraordinary change in the test.

Geo. C. Kreutzer, Kern County Farm Adviser:—Bluish milk indicates that the test is not high, so far as our experience goes; but it may not indicate that it is extremely

low. It is our opinion that cows produce the greatest amount of butter fat when they are in their prime—namely the third and fourth lactation periods.

W. B. Hopkins, Sec'y Napa-Petaluma Cow Testing Association:—If milk is blue, it would be a good idea to have it tested by Babcock test. Feed has considerable to do with the color of milk. Milk from green clover fed cows will show a richer color than from dry hay or mill-fed cows, although the percentage of fat may be the same. Milk from the average Holstein cow is usually rather blue in color, especially when the cow is on dry feed, but the percentage of fat may be up to the required standard. The Jersey cow will under the same conditions give a richer colored milk and usually it is actually richer in fat, but not as much as the color might indicate. Cows on official test for a number of years in succession have shown a slight variation from year to year; but in my opinion the variation is as likely to be less as more. It seems pretty well established that nature fixes the percentage of fat for each cow and that nothing materially changes this percentage except ill health or insufficient feeding.

S. F. Bonner, Sec'y Gridley Cow Testing Association:—In a large percentage of cases, in my opinion, bluish milk does indicate a scarcity of fat. However, Holstein cows' milk sometimes looks bluish when it tests rather high for the breed. This I think can be attributed to the small fat globules and the tendency of this breed to produce white fat. From our records, it seems that the fat per cent decreases rather slowly as the cow grows older after the third or fourth lactation period. The first and second tests are generally quite a bit higher, if the heifer is in very good condition, than if she freshened poor.

J. D. Williams, Sec'y Bodega-Sonoma Cow Testing Association:—The first man I asked, replied that he knew two men, each of whom had a cow giving blue milk. They tested it to settle an argument. One tested 6 per cent and the other over 5 per cent butter fat. I will pick some cows that give bluish milk and notice their records after our tester's next visit.

Charles Klint, Tester, Tulare Cow Testing Association:—Milk may be bluish from various causes, one be-

Did You Write This?

Here is an Empire advertisement written by Empire users—not a line of it from us—just statements from a few of their letters to us. If you did not help write it, it will pay you to read it; if you did help, you have already been paid in the satisfaction and service you are getting out of your machine.

"With an EMPIRE Milking Machine any boy who can start an engine can do the milking better than any hired man can do it by hand; we would need to keep an extra man if we did not have the machine; I milk 19 cows in 45 minutes, thus saving myself some three or four hours a day; I would quit the dairy business before I would go back to hand milking; cows like

The best recommendations for Empire Milkers that we have seen have come from users. They will interest you. Send for our illustrated pamphlet "What Dairymen Say."

better than they do the average hired man. It pays to install an EMPIRE Milker even for a small herd; it means less time for milking and more time for other things; it does not tire the men nor the cows; gives the biggest results with the smallest expense; labor cost is cut one-third; a boy and a girl do work that used to cost \$120 a month; a fourteen year old boy uses it on our Registered Holsteins—we use it on our highest tests."

Let us tell you ALL the benefits they offer you. Write for Catalog 45—and also ask for information regarding EMPIRE Cream Separators, Gasoline Engines and Electric Plants.

MAMMOTH HOLSTEIN AUCTION

Six miles south of Modesto on the Crows Landing Road, on

225 HEAD APRIL 27, 1917 225 HEAD

On the above date I will sell the complete dairy and dairy equipment of Rufe Moore, consisting of 225 head of Holstein cattle, as follows:

I REGISTERED HOLSTEIN BULL; 85 MILCH COWS; 100 HEAD OF HEIFERS, FROM 1 TO 2 YEARS OLD; 40 HEAD OF HEIFERS, FROM CALVES TO YEARLINGS; 70 HEAD OF HOGS, ALL SIZES; 10 HEAD OF GOOD YOUNG HORSES.

Dairymen, these are an extra choice lot of cattle. Mr. Moore has been in the dairy business for the past eight years and has always bred for the best, having bred to nothing but registered bulls from the L. A. Hall herd of San Jose.

There will be a fine barbecue dinner served with Spanish beans and all the fixings.

Positively not an animal of this herd will be sold before date of sale. There will be no fake bids or by-bidding. Come early and get a few of these choice cattle.

Mr. Moore is past eighty years old and is retiring from the business.

SALE BEGINS PROMPTLY AT 10:30 A. M. TERMS CASH.

COL. CY N. CLARK, Modesto, Auctioneer

RUFÉ MOORE, Owner

FRANK HATCH, Clerk

Do You Want Long Distance Backing?

We have a son of the California State Champion three-year-old for sale. Born October, 1915; Sired by PRINCE ALCARTRA KORNDYKE, whose dam is TILLY ALCARTRA.

The Dam of this young bull is not a fifty-lb. cow, but she has to her credit 21,208 lbs. milk and 860 lbs. butter in one year, which is the largest record ever made in California by a Junior three-year-old.

If you are in the market for a bull, it will pay you to visit our ranch and see what we have to offer—at prices that will surprise you.

J. S. GIBSON CO., Box 97, Williams, Cal.

D. O. LIVELY STOCK FARM, 215 Hobart Bldg., San Francisco

ing bacteria of bluish color present in great numbers. Milk may be blue from lack of fat, but I do not believe anybody can make a set rule to that effect. That would be as inconsistent as to say that highly colored milk is always rich in fat. This is not the case. Certain feeds (carrots for instance) would more

or less determine the color of the milk. The highly colored Guernsey milk gets its yellow hue from a color secretion rather than from the fat content. As a rule, a mature cow will have a better average yearly test than she will as a heifer.

Raise Calves from Tubercular Cows

[By State Veterinarian Chas. Keane.]

It is an established fact that only exceptionally are calves affected with tuberculosis at birth, and consequently, if removed from the dams in the first days of life, raised by themselves, and fed food that is free from contamination with tubercle bacilli, such as milk heated to the boiling point, such calves will grow to adult life and remain free from tuberculosis. No matter how badly infected the milking herd is, a new, clean, tuberculosis-free foundation can be built up from the calves with very little trouble or expense if the following simple rules are closely observed:

1. Provide a place on the ranch, or elsewhere, entirely segregated from where the balance of the herd is kept, where calves can be raised. The calves should be removed from the dams within five days after birth and taken to this place.
2. Before milk is fed to such calves, it should be heated to the boiling point.
3. Such calves should be carefully tuberculin tested several times in the first two years of life in order to guard against the possibility of

a calf which was tuberculous at birth remaining in the calf herd long enough to become a spreader.

Not only will the observance of the above rules result in the early establishment of a foundation for a tuberculosis-free herd, but other diseases, such as abortion and allied calf diseases, may be brought under control as well.

The control and eradication of both bovine and swine tuberculosis by feeding milk, which has been sufficiently heated to destroy any tubercle bacilli it might contain, is so simple and in many instances would be so inexpensive that it is hard to understand why dairymen do not take advantage of this method of raising a new healthy foundation, as well as protecting swine from tubercular infection of bovine origin.

The State Veterinarian of California is willing and desirous of discussing this at length with all dairymen of the State who care to give the matter serious consideration; and to such dairymen the State offers its services, such as tuberculin testing, etc., without any expense or condition whatever.

Weedy Silage Made Good Feed

[Written for Pacific Rural Press.]

Instead of morning glory, pig weed, and wild mustard depreciating the value of corn silage, when cut green and put into the silo with corn, it makes the silage more palatable and nutritious.

At least, that was the experience of A. E. Slater of Contra Costa county last year, who planted Indian corn on low land which overflows and on which the corn did not grow very high. The patch was badly infested with the above weeds; and, as the corn was short, the entire field was cut with a mower and pitched onto the wagon.

When feeding was started, it was observed that the cows preferred the mixed silage to straight corn silage

which had been previously fed, and also milked better on it. Mr. Slater also siloed a small patch of barley; but the cows did not relish it so much nor did they produce so heavily on it.

Because of the additional supply provided by the silo Mr. Slater was one of the few dairymen in his district who had feed till grass started in the spring; and this in spite of the fact that he was stocked up unusually heavy.

Select a cow whose flank is arched high at the side of the udder. Stand behind the cow and see that there is no flesh between her hind legs almost up to the roots of the tail.

Paicines Ranch Co.

The Best Gas Engine to Buy

WHEN selecting a gas engine, the most important thing is to get a good engine. There is no economy in buying an engine that is going to require frequent repairs and that is likely to balk just at the time you need most to use it.

The wise man considers service, reliability and durability first, and price second. Selected on this basis, the ALPHA is the logical engine to choose, because it is the simplest and most durable in construction and the most reliable in operation. It runs smoothly and powerfully on a minimum consumption of either gasoline or kerosene, and operates on a simple rotary magneto without the use of any batteries.

It is so simple that a woman or a boy can start and operate it, and the sensitive governor, which acts the instant there is the slightest variation in the load, insures steady running without any waste of fuel.

Before you put any money into a gas engine, investigate the ALPHA—and remember that the man who buys the best is never sorry.

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

Gotschall & Macgruder of Ripon state that they expect to officially test four of their registered Holstein heifers during the next month, one of the lot, a daughter of the King of the Pontiacs, being an especially good prospect. They now have 35 head of registered Holsteins.

Theo. D. Tintinger of Park City, Montana, one of the contributors to the D. O. Lively stock farm sale of registered Herefords to be held on May 3, writes that in Corrector Donald he is offering as good a bull as there is in America. Carlos Mischief is an exceptionally good one, as is also Carlos 2nd and Fairfax Model.

A sale of unusual attractiveness will be conducted by the California Breeders' Sales and Pedigree Company for Stalder Bros. on their Rosamond Farm at Riverside, Cal., on Tuesday, May 22. Sixty head of registered Holsteins will be sold, including cows with official records up to over 28 pounds butter in 7 days, a large number of cows and heifers bred to a 34-pound sire, and 15 granddaughters of Prince Gelsche Walker and Aralia De Kol. There will also be sold 17 head of well-bred, high-class Percheron stallions, mares, and colts, and 20 head of grade Holstein and Jersey heifers. Col. Ben A. Rhoades will act as auctioneer.

The catalogue of the registered Hereford cattle sale on the D. O. Lively stock farm at Mayfield on May 3d is coming off the press and is being sent out to those who have requested it.

Beef.

R. M. Dunlap advises us that among his other orders for purebred beef cattle on his present trip East are three Shorthorn herd sires and 10 registered range bulls for the Paicines Co. Mr. David J. Stollery placed the order.

It is said that W. E. Premo, manager of the Porterville Alfalfa Company and Prosperity Company's ranches, has contracted to deliver within the next thirty days 1,000 corral fed beef steers at \$120 per head.

Sheep and Goats.

It is announced that a herd of Toggenburg milch goats will be displayed to the 15,000 visitors expected at the University Farm picnic at Davis on Saturday, April 28.

The lamb crop in the Calipatria section of the Imperial Valley is said to be large. The crop is estimated to be 12,000. A trainload of milk lambs, it is said, will shortly be shipped to Chicago.

Swine and Swine Men.

Elmer Lamb reports sales of pure bred Durocs as follows: Two gilts to M. C. DeFraga of Bolinas; three gilts to C. B. Crawford, Wasco; and a boar to Fraser Brothers of Well-ton, Arizona.

The record hog sale has recently been made by A. B. Humphrey of Escalon. He sold to a Pennsylvania breeder the P. P. I. E. grand champion Berkshire boar, Grand Leader II, with twenty sons and daughters, for \$4500. The boar brought \$3000.

The two-year Duroc boar, Crimson Monarch II, at the head of the De Vilbiss herd of registered Durocs in Stanislaus county, has developed into an outstanding aged boar weighing 800 pounds in his working clothes at two years. He is siring some choice pigs.

The Whitehall Estates Company at Tracy have recently sold twelve Percheron fillies for Hawaiian Island shipment. They now have close to sixty Berkshire brood sows.

Miscellaneous.

On account of the great diversity of the interests of the trustees of the Leland Stanford Jr. University, they have decided to concentrate the resources of the university and thus make administration safer and easier. The sale of the entire herd of purebred registered Holstein cattle on the university ranch at Vina will be the first move under this new policy. More than 300 head will be sold at the ranch on June 5, 6, and 7, under the direction of M. H. Tichenor as sales manager.

The Turlock Irrigation District will stop raising melons and grow foodstuffs if necessary during the period of our war with Germany.

California's development of water power now ranks second to that of New York only.

Dairy Cow Competition Entries Close May 1.

Dairymen and breeders of dairy cattle are reminded that entries in the State Dairy Cow Competition will close on May 1. The object of this competition, which is being conducted by the College of Agriculture of the University of California, is to improve the dairy herds of the State by stimulating the interest in production tests of the cows. Nearly 100 prizes, varying in value from \$300 to \$10 each, are offered for records of production. More than one-half of this amount will be awarded for records of production by grade and common cows only. It is worth the effort of any dairyman who owns good cows to enter these in the competition. Members of cow-testing associations may compete for the prizes offered for yearly herd records without extra expense, and at greatly decreased cost for prizes for individual cows and groups of cows in their herds. The complete list of prizes, with copy of the rules governing the competition, will be found in Circular 153 of the College of Agriculture.

A Promising Sale.

R. M. Dunlap tells us, after a visit to W. M. Carruthers' stock farm at Mayfield, that, having seen the Shorthorns to be sold at the farm May 2, he found an exceptionally useful lot of cattle. Strong young bulls of good, serviceable ages are included in the sale. Everything is in good, strong breeding condition. He also visited James McDonnell, manager at the Ormondale stock farm at Palo Alto, where he reports everything looking fine. Their Golden Goods bull is proving himself a great sire. McDonnell is contributing an extra choice red bull, about 20 months old, to the Carruthers sale. Cattlemen should encourage sales of this sort by being on hand.

BASSETT'S POLAND CHINAS

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Young stock, \$30 Up.

GREAT SCOTCH SHORTHORN SALE

46 head of Pedigreed Shorthorn Cattle to be sold at Carruthers Farms, Mayfield, Cal., Wednesday, May 2d, 1917, at 1:00 p. m.

An unusual surprise awaits the Short-horn Breeders of the country at the CARRUTHERS FARMS SHORT-HORN SALE, May Second, 1917. This great consignment represents splendid blending blood lines and mating individuals for the improvement of the breed. For individuality and breeding they will be hard to duplicate.

The breeder in the market for show animals, who recognizes the individual worth of the cattle themselves and who appreciates their future value, and who wants to buy profit producers and backs his judgment in selecting animals that will prove good investments, will find at our 1917 sale precisely what he has set head and heart on getting.

Below will be found the Pedigrees of a few of the Top Animals in the Sale:

California is short of females of Short-horn blood—fully 9 out of 10 purebred bulls in the State have been imported from the East. The cows offered in this sale will produce purebred stock of as high quality as any to be found on earth. The bulls to be sold are of the quality and type to head your herd. All of the stock, with fitting, will make show animals.

GET ONE OF THOSE 9 RED BULLS

Plan to attend this Sale at Mayfield, May 2d, at 1 p. m. Write us or wire if you are coming, or for further information. Terms of sale cash, unless other arrangements are made before the sale.

Col. Carey M. Jones, Auctioneer

W. M. Carruthers, Mayfield, Cal.

Cows and Hogs Pay for Tree Growing

While hogs and dairy cows are a practical solution of permanent agriculture by themselves, they may also be used advantageously in a development scheme where fruit is the ultimate hope, and a good example of this may be seen on the New England-California Corporation's ranch in the southern part of San Joaquin county. The development plan of this ranch consists of planting most of the 400 acres bottom land, as well as the 300 acres of high land, to pears, almonds and olives, there being 45 acres in pears and 145 acres in almonds and olives at this time.

To make some profitable use of the land while the orchards are coming into bearing, the upland orchards were leveled and checked for alfalfa before planting, the trees being planted on the levees. Irrigation water was provided from the river which adjoins the ranch on one side by the installation of an electrically driven pump and a reservoir. The alfalfa grown between the young trees in this fashion sup-

plies more than enough hay for the dairy, which will consist of 90 head before the end of the present season.

To supplement the feed supply for the dairy, Indian corn is grown on the lower lands not yet planted to orchards, and this is used for silage making purposes in two silos. In this way the roughage grown is turned off the ranch at a good figure. But the dairy also contributes to the 1,500 head of hogs now on the place, as the skim milk is profitably fed to the brood sows and pigs.

The hogs also utilize wild feed and summer grain crops that are grown on the vacant lower lands, the latter crops being used to properly finish all hogs before they are marketed.

In this manner the dairy cows and hogs, while nowhere near paying the cost of development work, are expected to pay all expenses in bringing the orchards into bearing after land leveling, checking and planting are completed.

Steaming Ground Rice for Hogs

[Written for Pacific Rural Press.]

Rice can be fed more profitably and in larger quantities to hogs if it is steamed or cooked than if fed dry according to the experience of the Tweede Ranch and Land Co. of Glenn county, who first experimented with rice as a hog feed early in 1916 and who finished 100 Berkshires for the market the past winter.

The first experiment was made with eight hogs on a ration of ground rice and rolled barley. The rice was added to the ration gradually to accustom the hogs to it. When the quantity of rice had been increased to one-half of the grain ration the pigs' stomachs seemed to be upset, and they were not doing well.

After this trouble arose, the grain ration was steam cooked in a galvanized iron trough, with steam from a small boiler. In this form the hogs seemed to do better and more rice was added till the ration was two-thirds rice and one-third

barley. The hogs were finally turned off at about nine months, averaging 255 pounds.

Convinced of the value of ground rice, Mr. Tweede last fall decided to finish 100 head on it. As this is written, the lot have been on feed three and a half months, the ration comprising ground rice, barley, and alfalfa meal. To begin with, this lot was also fed on dry grain; but like the first lot, did not do well when rice constituted the major portion of the ration. According to Mr. Tweede they began to do poorly when seven-tenths rice and three-tenths barley was fed.

Because of this additional experience a larger boiler has been secured; and in the future, all rice will be thoroughly steamed before feeding.

Mr. Tweede has used the ground steamed rice with alfalfa meal as the sole ration for his brood sows and states that results so far have been entirely satisfactory.

Modern Draft Horse Barn

[Written for Pacific Rural Press.]

One of the most practical as well as one of the most sightly barns for a draft horse breeder that has ever been built in the State is the one just being completed on the Danville ranch of Easton & Ward, purebred Shire breeders. The barn is square shaped, with a large open court in the center that provides an exercising track, concrete watering troughs, hitching racks, and two plots of lawns ornamented with evergreen trees and shrubbery.

Twenty-two box stalls all opening into this court constitute the capacity of the barn, together with office and harness room. Above the stalls are hay mow and granary, chutes from the hay mow leading into each stall to simplify feeding. All hay

is put into the mow from the back end of the barn as well as straw and grain. Space is also provided for chopped hay, and rooms have been fitted up for the attendants, overlooking the entire court.

Six paddocks will be provided adjacent to the barn on the back and end of the building to provide exercising space for the horses while held for sale and being prepared for shows.

Reduce the number of fruit pits on your orchard before they start to harden.

Mysterious cutting off of leaves on trees and vines is usually the night work of cut worms. Poisoned bran gets them.

1917

Record: 31.92 Pounds of Butter in 7 Days

One of the Many Great Individuals

Authorities assert this is one of the grandest herds ever established. Since its foundation thirty years ago by the late Governor Stanford, it has been developed to the maximum by the introduction of blood strains of proven worth.

40 A. R. O. COWS ARE TO BE SOLD
and many others that will make as good or better records.

Also in the herd are 40 daughters of King of the Pontiacs 14th, 84332, that great show bull and best individual son of King of the Pontiacs; 20 heifer calves of Segis DeKol Pontiac Burke, 140339, all great prospects; 40 daughters of Dutchland Colantha Sir Ormsby, 55055, a great son of Colantha Johanna Lad, all making good records; Genesee Lad, 90356, and 45 very promising daughters.

The herd has been tuberculin tested recently, and is also free from abortion.

This sale offers unequalled opportunities to the advanced breeder, the beginner, the dairyman.

Special Trains between Chico and Vina each day of Sale.

VETERINARY QUERIES

[Answered by Dr. H. B. Witheringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

Peculiar Horse Disease.

To the Editor: A neighbor lost two horses, one five years old, first symptoms stiffness of all muscles, very nervous, chilly, no fever, bowels and kidneys regular. Third day commenced swelling on each side of the neck and over the windpipe, not clear down to breast nor clear up to the jaws. Swelling very hard. Strong liniments and blisters took no effect. On fourth and fifth days the horse seemed enough better to turn out to grass. In grazing, would turn his head uphill. After the sixth day, seemed very sore over the lungs, but that left in a couple of days. All this time his appetite was good, would lie down regularly and get up easily. On the sixth day the swelling broke inwardly and discharged very freely from the mouth and nose, a white foamy substance, not of matterly color at anytime. After this swelling broke, the horse could not swallow either food or water. He would chew feed and try to swallow; but it would put him in terrible agony and he would cough the feed and water out of the mouth and nose. He died the ninth day very weak, but didn't seem to choke or swell or stiffen up, nor to be in much pain. The second horse would stand with hind feet placed far forward, head high and set back, very chilly, legs and ears warm, no fever, good appetite, bowels and kidneys regular, neck and whole body stiff as if slightly paralyzed, could walk uphill very well, but not down hill. In five or six days he swelled on both sides of the neck with soreness. No swelling elsewhere. Stiffer and less use of legs every day. About eighth day would stand with right front leg extended under body and would drag the toe when walking. Not lame, but losing use of the leg. Then began to stand with hind feet forward. In 10 or 12 days would drag both front feet and the right hind foot. Could lie down and get up alright until the fourteenth day, then couldn't lie down and could scarcely walk. Could turn to the left easier than to the right all the time. Appetite, bowels and kidneys always good. Temperature normal. Never lost flesh. Swelling on neck very sore. Never coughed. Mouth and nose clear. Eyes bright. Very nervous. Fell dead on the nineteenth day. Mouth and tongue very blue as soon as he fell, and neck and head swelled immediately and he stiffened at once.—C. T., Union.

As near as can be determined from the description given these animals were suffering from a Streptothrix infection. In the writer's hands an autogenous vaccine in conjunction with stimulants and free opening of the abscess has given fair results.

Horse's Eyes Water.

To the Editor: A healthy three-year horse got watery eyes in hot weather, but they were all right

when cool weather came. Last summer I was told he had "wolf teeth." A veterinarian pulled them, yet the horse's eyes have been watering slightly and forming a little dark scab all winter.—P. A., Lodi.

The trouble is due to an infection of the eyes. Place a few drops of a 25 per cent solution of Argyrol in the eyes twice daily.

Colt Sweeneyed.

To the Editor: A three-year colt was sweeneyed two months ago. Has not been worked since. Shoulder shrinking away. Can it be cured? How long will it take?—H. H., Linden.

An injection hypodermically of rectified oil of turpentine, consisting of a few drops, in eight or ten places over the shrunken area works wonders. The animal is to be kept at work while under treatment, which may have to be repeated two or three times.

Irregular Heat Periods.

To the Editor: A 2½-year heifer dropped her calf in October. The first three months she came in heat at the proper time. Delayed breeding owing to her age. About eight weeks ago let bull serve her and now she comes in heat every week. Has some discharge. Seems all right every other way.—G. W., Willows.

This heifer has cystic ovaries. Call in your veterinarian, and he will break down these cysts by manipulating the ovaries.

Loose Lump in Teat.

To the Editor: A good cow has a small lump in one teat. It moves up and down when milking. Milk from this teat is somewhat stringy; but after about two weeks is all right.—G. U., Santa Rosa.

This is a teat tumor and will eventually render that quarter useless. It is possible at times to remove these surgically in particular cases.

Lice on Mules.

I have a band of horses and mules and they all have lice. Is there any thing I could feed them to kill the lice? Saw in one of your issues to mix coal oil, soap and water and wash them with that. My mules are wild and not halter broke. That would be a pretty hard undertaking as they are pretty light on their hind feet at times.—J. S., San Lucas.

Run them into a chute such as we have described recently for beef cattle; and apply the wash. You can't feed them anything to kill the lice without killing the animals also.

HERCULES

JUMBO-RIVETED HALTERS

LIKE everything else in the Hercules line, the Halters are made to last, to give good service, to wear

well, and always to be relied upon in an emergency.

Those Jumbo Rivets have a quality all their own. The heavy halter is oak-tanned in California, the source of the best harness leather.

They are so strong we could almost afford to offer to pay for a new horse, in the event that one of these Halters broke; but we will give you a new halter if one breaks under ordinary usage.

Ask your dealer for Hercules Halters.

When a dealer offers you a Hercules Harness, Horse Collar, or Saddle, he is offering you **THE BEST THERE IS**

Fast Grading of Hogs Into Six Sizes

[Written for Pacific Rural Press.]

It is usually a series of circumstances rather than a single thing that allows one to "top the hog market"; and while breeding and feeding may be logically called the most important, proper grading of hogs before fattening and again before shipping has a good deal to do with getting the top price.

On the Stanford University's ranch at Durham, Butte county, Superintendent J. F. Van Loben Sells attaches so much importance to this feature of the ranch's hog operations that he has constructed a grading chute which permits grad-

ing into six different sizes as fast as the hogs can be driven into the chute.

The entrance to this chute is V shaped with a gate at both ends so that the hogs may be held in the temporary corral, both gates swinging toward the center, which permits crowding the hogs into the chute.

The chute proper is two feet wide and is located with large feed lots on each side. Small gates just large enough to admit a good sized hog open off from the chute into these lots. These gates swing toward the lot and away from the chute. At the same point in the chute another small gate is located which permits entire closing of the chute at that place.

As the hogs are driven through the chute they are segregated by the use of the gates into different lots of equal size so that a mixed lot may be brought in from the fields and quickly and easily graded. According to Managing Foreman F. C. Franklin, a little practice makes it easy for an ordinary person to separate with very close precision; and this work makes for better prices, as it makes a flat price per pound for the buyer a safe proposition.

SATISFACTORY BARN FLOOR.

[Written for Pacific Rural Press.]

The floor construction of modern dairy barns is a feature that demands more than ordinary consideration because of the difficulty in remodeling them.

On the Stephens Dairy, near Mission San Jose, a barn having a capacity of four strings was erected two years ago; and has since proved entirely practicable in everyday use.

A cross section view of this floor would show a 10-foot feeding alley down the center of the barn, with a 21-inch manger on either side. The distance between manger and gutter is five feet, large cows being used. The gutter is 16 inches wide, being six inches high on the front and four inches high on the back, with a six-foot passageway between it and the outside wall.

Both the stall floor and the back passageway drain to the gutter; and the entire floor and gutter slopes toward the end of the barn one foot to the hundred. This allows good drainage for liquid manure and washings and with a 16-inch gutter, a wide broom can be used to good advantage in sweeping down the solids. Steel stanchions, feed and manure carriers complete the sanitary and convenient features of the barn, the concrete silos and feed barn being located at one end of the building so that all feed is stored outside of the milking quarters.

Always keep two rings in the bull's nose so that when one breaks he can be safely handled until the broken one can be replaced. Fasten a strong, light chain to the ring and make it long enough so that the other end will drag on the ground two feet behind his fore feet. This keeps him under constant discipline.

15 Granddaughters of Prince Gelsche Walker, Sire of the new 34-pound Junior four-year-old California champion! 20 Well-Bred Heifers and A. R. O. Cows in Calf to a 34-pound grandson of King of the Pontiacs!

These are a few of the good ones that we will sell for

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

Raising Poultry for Profit

RAISING CHICKS IN HEN HOUSES.

[By Susan Swaysgood, Pomona, Cal.]

A lady asked me the other day if she could not raise her little chicks in one part of her hen house. I told her "No." She would not raise enough to cause her any heavy feed bills. But, she is going to try. It simply can't be done, because the older fowls are just as poisonous to baby chicks as is something entirely foreign to them. It has been tried time and again. The fact that one lot of chicks will not grow and thrive on the same piece of land that has had one brood raised on it that season seems to show that ground over which old hens have run will not raise baby chicks. Unless the runs are dug up and planted to something green, you cannot expect to raise a succession of broods on the same runs. Put your chicks as far away from the hen houses as possible and give them a fair chance, they will pay you back in dollars and cents, also in satisfaction, for we all like to have good results from our labors.

Turkeys may still be set.—This has been a late spring, very few turkeys have been hatched and everybody complains that their hens will not sit; but according to the season we can run these things a little later than usual. I would not be a bit afraid to keep right on hatching, for we have not begun to have any summer weather yet. But this month will see hens getting broody and for two whole months every egg can be set.

HATCH ALL YOU CAN.

[Written for Pacific Rural Press by Mrs. Susan Swaysgood, Pomona.]

This year all kinds of live poultry are scarce, so this is the time to hatch every egg you can, especially of the large breeds. They make a good family meal; and a restaurant or hotel man can serve quite a few patrons a dinner from a good big Rock or Orpington. Hatch the brown eggs at this season in preference to the white and make money out of your poultry. Those who think feed is too high, and will not venture to hatch, will miss it; because if they have a little patch of land they can easily provide a good portion of the feed that will serve to raise the chicks. And the man or woman who can help to increase the food of the country is doing more for it, really than if they were in the front ranks of the fighters. I went out of business, as I supposed, but in the face of this shortage I feel it would be criminal not to raise a few chickens; and the other day I started an incubator. Just could not help it. All preaching and no practicing, does not agree with me.

QUESTIONS ANSWERED.

Poultry Feed Weight.—Sometimes we are asked about how much a measure of feed will weigh. These are the average weights: 1 quart of middlings weighs 1 pound; 1 quart shorts, 1 pound; 1 quart bran, ¾ pound; 1 quart alfalfa meal, ¾ pound; 1 quart rolled barley, 1 ½

pounds; 1 quart wheat, 2 pounds; 1 quart corn, 2 pounds; 1 quart crushed oyster shell, 3 pounds; 1 quart beef scraps, 1 ¾ pounds; 1 quart unshelled oats, 1 pound; 1 quart kaffir corn, 1 ¾ pounds.

Why Do Hens Set.—What causes both Leghorn and Orpington hens to want to set frequently? What do they require in their food to prevent it?—Mrs. I. R. A., Lincoln.

[Answered by Susan Swaysgood.]

It is not caused so much by feed as by heredity. Leghorns do not usually set until fall or late summer; but with Orpingtons, it is very natural to sit now. All you can do is to give less starchy foods (such as corn meal, middlings, etc.) and feed more green feed and animal food such as beef scrap. Green feed is cooling and does not let the blood get heated up.

Turkeys' Crops Sour.—I raised nine turkey hens last year. A month ago one of them sickened and wouldn't eat. I gave her a corn meal-milk mash and a little oil. When she died, ten days later, the contents of her crop were very sour, mostly water and a little grain. Two more hens are sickening. I feed Egyptian corn, keep them in a large pen partly covered with trees, and let them out part of each day. They have clean drinking water. Droppings of the sick turkey were very green and thin. Tell me also how much corn these turkeys should have three times a day.—Mrs. J. R., Healdsburg.

[Answered by Susan Swaysgood.]

Give each one a pill or two made of 2 parts flowers of sulphur, 2 parts cayenne pepper and 1 part flour. Mix into a dough with a little water and feed each turkey one a day until they recover. Feed no corn but just a little mash and a little wheat or soaked oats.

United States had a foreign trade in 1916 of \$7,873,000,000, which is greater than that of Great Britain.

The Alameda County Farm Bureau will hold its annual meeting May 5 at the Water Tower, Sunol.

VICTOR BROODERS—Better Than a Hen. Defeated all other makes at P. P. I. E. Heat evenly distributed over all chicks. Chicks don't crowd, trample and smother each other. Safe to operate. VICTOR BROODERS raise more chicks than a hen, carry no lice, make no cripples. Raise your chicks with VICTOR INCUBATORS and BROODERS. Keep the hens laying. Ironclad guarantee, with machine. Send for FREE booklet.

MAMMOTH BRONZE TURKEY EGGS—\$3.50 per setting. Toulouse Geese eggs, 25c each. Mrs. M. Coghlan, Walnut Creek, Cal.

Mrs. Best's Letter.

CLOTHES FOR CHILDREN.

Dear Friends:—Perhaps you would be interested to know what the shops are showing for tiny tots. Tub things are always good for them, as falls and dribble stains are easily removed. Any one can make the simple clothes now in vogue even if they do not sew. The patterns are clear and the work is so brief that you can finish a garment before you tire of it.

For little boys there are suits of short trousers, open at the knee, and jackets made in Norfolk or middy style. The middie blouses lace at the sides and at the throat, have no plaits or gathers, but are simple blouses with sailor collars, no belts and short or long sleeves. The Norfolk jacket is made with a yoke, the same depth all around or with a yoke pointed in front and back. Some are made with box plaits, others with no plaits at all, and one had small plaits sewed down under the belt in back. All had belts and big collars. The sailor collars rolled away from the neck in true sailor fashion, but the Dutch collars laid flat.

Sonny is dressed up now by merely changing into another colored suit. To give you an idea of the materials and colors used, the styles show that Galatea, Indian head, rep and linen are popular. A black and white striped suit in the middie style was shown, red trimming the white collar. A green and brown rep in middie style had short sleeves, a white sailor collar and white band two inches wide at the bottom of the blouse. A tan linen suit had plaits sewed down under the belt in the back, had a large white collar embroidered in black over a tan collar and large pearl buttons down the front and at the knees of the trousers. A small tan cloth hat, encircled by a brown ribbon was shown with this suit.

There was also a cunning rose crepe middie suit for every day wear. The white suits were of both the styles and also very nautical, with long trousers and emblems sewed on collar and sleeves.

All the suits were decorated with pockets and buttons.

Tiny tots are dressed up when they have on one of the cunning knitted sets of leggings, sweater and cap. These sets come in all colors, are inexpensive and very comfortable for baby.

Little girls wear half hose and broad toed shoes like their brothers, only when they are dressed up their sox are more fancy, and patent leather strap pumps displace the kid shoes. There are adorable hats for the little Miss, all droopy and small. Some are plain straw trimmed by a band and rosette of ribbon, others are made dressy by a flower at the front of the crown and streamers of ribbon floating off the back. Dresses for special occasions are of sheer white stuff, long waisted, with a simple sash, depending upon the tucks and plaits to determine the exact dressiness.

One shop has been showing blue and rose linen empire dresses for afternoon wear. These are smocked or else gathered on a yoke and decorated with a long and short stitch

in black, or by an applique of something bright. These dresses have flat, wide collars of white and long sleeves, gathered into a band at the wrist and finished with an inch ruffle.

For play dresses, the Russian blouse and bloomers seem to be most satisfactory. The dress hangs from the shoulder and is loose, giving free play, and the bloomers obviate petticoats, and the difficulty of having them the right length.

Little girls' coats are most attractive. They are made of a pretty colored warm cloth in Empire style. The skirt is shirred to the yoke and sometimes finished with a cord. The sleeves are generally loose with a large flat cuff of the same contrasting material as is the collar, or trimmed like the collar. Usually they button up closely to the neck and are held by three large buttons down the front. The coat fits the shoulders rather snugly, the collar is large and the skirt is full and flares slightly. Cunning little ribbon bags are carried also, to complete the costume, and with these the little girl looks a miniature of her mother.

ROSABELLA BEST.

WASHING LACE CURTAINS.

It always pays to have a frame of light wooden strips to dry lace curtains on. It should be the exact size of the curtains, so that they may be stretched on it when wet and dried in this way. Tack a strip of strong cloth on all sides of the frame and pin the curtains evenly to this strip, top, bottom and sides. The ready made frames have small tacks over which the curtain is drawn. All net curtains can be more successfully washed by using the frame, as they stretch badly when wet.

The day before the curtains are to be washed, take them down, shake free from dust and put to soak in cold water. Change the water often and let soak over night. The next morning, wring and put into warm soap suds in which a tablespoon of borax has been dissolved for every gallon of water. Souse them up and down well and then scald in the boiler. Put through at least two rinsing waters and if they are white curtains blue them a trifle and place them on the frame on the grass to bleach. If they are creamy in color, dry in the shade, and if the color is to be deepened, add a

little strained coffee to the rinsing water.

HOW TO SELECT FOODS.

The health and appearance of the family are a good test of the wholesomeness of their diet, according to the United States Department of Agriculture Farmers' Bulletin 808, on how to select foods. If they are strong, well developed for their ages, free from ailments, full of energy and ambition, one may safely say their food agrees with them. But if they are listless and ailing, or not as well developed either physically or mentally as they should be, and if a competent physician finds that there is no special disease to account for these bad symptoms, a mother may well ask herself if the food is right, and if not, how she can make it so. The danger is that the diet taken week in and week out has provided too much or too little of some one nutrient.

Habit and custom help greatly, because they usually are based on what the experience of generations has proved is wise and healthful. Good food habits include more than cleanliness and order in everything that has to do with food and meals, and leisurely ways of eating. Equally important are a liking for all kinds of wholesome foods, even if they have not always been used in one's home, and eating reasonable amounts. To refuse to eat some wholesome dish simply because one is not accustomed to it may prevent the use of some very desirable and economical food. To feel that there is any virtue in providing more food than is needed shows poor taste as well as poor economy.

CREAM SOUPS.

The foundation of all cream soups is a white sauce made by stirring two tablespoons of flour into one tablespoon of melted butter. To this add one quart of milk with a teaspoon of salt and a dash of white pepper and bring to a boil. A pint of cooked green peas mashed or spinach or asparagus is good. To make a celery soup, boil one pint of cut celery till tender and add to the milk. For potato soup, use six large potatoes boiled and mashed fine, then stirred into the milk and strained, adding a tablespoon of chopped parsley just before serving. For corn soup, add a can of corn, chopped, to the milk.

Cook Pork Thoroughly

Eating insufficiently cooked pork recently caused serious illness in every member of a Marin county family. The cases were investigated by the Bureau of Communicable Diseases of the California State Board of Health and it was determined that the patients were suffering from trichinosis, a disease that exists chiefly in rats, hogs and men.

Rats become infected through eating scraps of infected meat about slaughter houses and through eating each other. Hogs become infected through eating rats, and men become infected through eating hogs. If pork is thoroughly cooked before eating, however, there is no danger of contracting the disease. Trichinosis is without doubt more prevalent than is generally known, many cases being mistaken for other diseases. Housewives should always cook pork thoroughly in order to make certain that dangerous meat is not served on the family table.

HINTS TO HOUSEKEEPERS.

A hot iron will soften old putty so that it can easily be removed.

The tone of a piano is much improved if the instrument is moved out from the wall.

To remove sewing machine oil stains, rub the stain with sweet oil or lard and let it stand for several hours; then wash in soap and cold water.

Cut glass dishes need washing often even when not in use, as the dust accumulates in the cuttings. Wash in warm water, rinse in warm water and bury while still wet in fine sawdust for several hours. When perfectly dry, the sawdust will brush off easily with a soft brush. This method prevents scratching.

To prevent the icing of a cake from running down the sides, double a piece of oiled paper three inches wide and fasten it closely around the cake, letting the band come an inch above the cake. In this way a cake may be frosted evenly and with a thick layer to its edge. Do not remove the band of paper until the icing is thoroughly dry.

If the fringe has worn from the ends of the rugs or if they have never had fringe but are worn threadbare, a new fringe can be purchased at any good furniture store, together with the heavy thread necessary to use in sewing it on. The improvement is well worth the expense.

HONEY RECIPES.

Editor Home Circle:—I have some old strained honey and would be glad of any recipes for using honey in cooking.—L. L. S., Modesto.

For honey cake take one-half cup butter, one cup sugar, one cup honey, one pint flour, one teaspoon baking powder, two eggs and one teaspoon caraway seed. Mix honey and sugar, add the butter melted, the eggs slightly beaten, and the flour sifted with the baking powder and caraway seed. Mix into smooth batter about like sponge cake. Bake 35 minutes in fairly hot oven.

Will some of our readers who have tried honey recipes be kind enough to send them in to this department?

MEXICAN RICE.

One cup of rice washed and thoroughly dried, one tablespoonful of lard in bottom of iron pot—heat to boiling, pour in rice, stir constantly until a light brown color. Add two small onions chopped, one-half can of tomatoes put through vegetable masher. Cook together five minutes, season with salt and pepper. Cover all with boiling water and cover the kettle closely. Simmer an hour on the back of the stove.

Patriotism, Like Charity, Begins at Home!

Home should be every man's castle. Not a feudal fortress to protect him from enemies without, but a place of quiet harmony where he may buckle on the armor of resolute readiness for "service at the front" in everyday affairs.

Therefore, true Patriotism may be expressed in making the Home a place of real preparedness.

Good Health.

[By H. E. Pastor, M. D.]

CARE OF THE TEETH.

Teeth kept perfectly clean will not decay. Decay is caused by bacteria which find lodgment in protected places on tooth surfaces and by breaking down the sweets and starches of food remnants produce an acid that destroys the tooth substances.

Keeping all tooth surfaces absolutely clean by proper brushing and rinsing the teeth and mouth after each meal, and the use of silk floss before retiring, would probably prevent most of the decay in children's teeth.

Care and attention should be given the teeth of all children, for with decayed teeth food cannot be perfectly masticated, and imperfectly masticated food cannot be perfectly digested, thereby preventing the proper development of the body and lowering its resistance to disease. Tonsillar disease, rheumatism, and many other ills are caused by swallowing the decayed matter from uncared-for teeth.

It might be mentioned in this connection that the mastication of garlic is reputed to account for the fine white teeth of our Italian population. The doctor in charge of the dental clinic of the New York Board of Education says he found not a single defective tooth among the pupils of Italian descent. San Francisco clinicians say that Italian diet is fine for teeth, and that it takes two generations for teeth to become "Americanized."

A GOOD COLD CREAM.

During the summer months, and especially in windy and hot weather, one requires a good cold cream that can be applied in the daytime without being noticeable. For such, try the following recipe: Take half an ounce each of spermaceti and white wax, with two of witch-hazel and three of sweet almond oil. Let the wax and spermaceti barely melt over hot water before adding the oil. They should only just turn liquid before being removed from the heat. Mix in the oil, then with a silver fork add the witch-hazel, drop by drop; beat to a smooth cream, adding a few drops of any preferred perfume.

HEALTH JOTTINGS.

Onions are one of the best nervines known. They are as useful as any medicine in cases of nervous prostration, and nothing else so quickly relieves and tones up a worn-out system. The use of onions will relieve cases of coughs, colds, influenza, and are useful in treating consumption, insomnia, scurvy, gravel and kindred liver complaints. Eaten every other day, they have a clearing and whitening effect on the complexion.

Raw beef proves of great benefit to persons of frail constitution and to those suffering from consumption and other wasting diseases. After being chopped fine and seasoned with salt, heat by placing the dish in a pot of hot water. It is rapidly assimilated and affords much nourishment.

Blackberries are a tonic and useful in all forms of diarrhoea.

SAN FRANCISCO.

San Francisco, April 18, 1917.

WHEAT.

While trading in wheat during the past week has naturally been limited by the scarcity of offerings, there has been a steady advance in asked prices, with buyers forced to pay just about what the holder cared to ask. Northern bluestem was again in the market as the result of another shipment from Washington, and sold readily at \$3.80@3.85. The heaviest advance of the week came on California Club, which is being held at \$3.65 in any but very large lots.

Sonora wheat, re-cleaned.....\$3.75@3.85
Northern Club.....None offered
California Club, per cbl.....\$3.80@3.85
Northern Bluestem.....3.80@3.85
Northern Red.....3.45@3.50

BARLEY.

The advance on barley futures has not been quite so rapid during the past week, the market presenting an appearance which could be taken to indicate an "over-stimulated" condition. The interests which were buying so heavily last week withdrew their support, but prices still held very steady around \$2. Representatives of San Francisco houses are still scouring the producing sections in an effort to close contracts for the next year's crop; and deals of this sort for as high as \$2.05 per cental have been reported. Crop indications cannot be said to have improved, although rains at this season would help to bring an improved yield. Feed stock is still in demand from herd owners in various interior sections and spot stock is being held at \$2.60@2.75 per cental, with only round lots going at the lower end of this quoted range.

Shipping, cbl.....Nominal
Brewing.....Nominal
Choice feed, cbl.....\$2.65@2.75

OATS.

Red feed oats were unchanged during the week, but white grades added another \$1 per ton under a good shipping demand. There was some export inquiry in the market, but none of the local houses cared to fill these orders at the figures foreign buyers were willing to pay. There are no large holdings of oats in the market at present.

Red feed.....\$3.25
White.....\$2.55@2.60

CORN.

Eastern markets are still so unsettled that no adequate quotations are available on Eastern Yellow corn to arrive, this line being practically cleaned out of the local market, with no immediate prospect of any stock reaching here for some time. California stock advanced two dollars per ton during the past week, with milo and Egyptian holding very firm at current quotations.

(First-hand prices on strictly first-class grain, San Francisco.)
Eastern Yellow, cbl, bulk.....Unsettled
California, sacked.....\$3.15@3.20
Milo Maize.....2.85@3.00
Egyptian.....2.90@3.10

There was another general advance in bean quotations during the past week despite the fact that prices are now so high that a large percentage of the retail demand is bound to be curtailed. The only variety which failed to move up was horse beans; and local holdings of this variety are generally off-grade and hard to move. The local trade is fully prepared for further advances, and some idea of the firm futures market is to be found in the fact that brokers here are contracting for next crop whites and limas at 9½@10c. One of the most important independent brokers is responsible for the statement that "futures in the grower's hands are worth almost what he wants to ask for them." The placing of further foreign government orders in the East last week has brought more efforts on the part of Eastern wholesale grocery houses to close contracts here, and holders of carload lots have no trouble in selling to these houses at the current prices. Generally speaking, the grower who is in a position to carry himself through cannot lose by refusing to sell at this time. Reports from throughout the State say that while rain would be very welcome it is still too early to say that the lack of rain is going to mean a crop failure. Well-backed reports on acreage would indicate that the total increase in California will be between fifteen and twenty per cent over last year. There is no cause for either alarm or worry in this condition, as California will have more than enough business next year to care for any increase in production.

Beans, per cbl.....\$10.00@10.50
Blackeyes.....9.00@9.25
Cranberry beans.....11.00@11.50

Mexican Reds.....10.00@10.25
Tepary beans.....None offered
Garbanzos.....5.00@6.00

HAY.

Receipts of hay continue to decline, as country needs are forcing a continually increasing trade between the various country sections. Arrivals last week were 1,380 tons, as compared with 1,771 tons for the week before and 2,063 for the week preceding that. Some Oregon and Washington hay, purchased last month by local dealers, met fair sale here at \$24@28 per ton. The fact that local herd owners are unaccustomed to feeding cheat, vetch, and the oat and clover varieties has served to hold down prices on this stock. Local hays were generally higher and fancy wheat touched a new top of \$32 per ton in carload lots. Showers last week proved of only temporary relief to the grain sections and the first cutting of alfalfa, offered here too green, proved almost unsalable. It will be at least a month before the new alfalfa hay will be of practical value; and until then there is every reason to look for continued high prices, and possible advances. It is conceded that there will be practically no

FEEDSTUFFS.

The cleaning up of this market's holdings of beet pulp, and advances on alfalfa meal and bran were the outstanding features of the past week's feedstuffs market. While ranchers are buying as sparingly of these offerings as possible, feed conditions are such that further advances on these offerings can be expected.

(Per ton, San Francisco.)

POTATOES, ONIONS, ETC.

With outside markets again buying here, prices on potatoes have again advanced and fancy brands of delta stock are commanding as high as \$5 per cental. So valuable has this product become that for the first time in the history of the market here special night watchmen have been detailed to watch the wharves where the precious tubers are stored. Local onions are out of the market, with the Australian variety bringing \$8.00@8.50 per cental. Local green onions are commanding \$1.25@1.40 per lug box. Asparagus is quoted at a wider range, owing to heavier offerings of cull stock, and the same is true of lettuce. Wax beans during the past week brought as high as 25 cents per pound.

Asparagus, per lb.....3½@7c
Peas, per lb.....5@8c
Wax Beans, per lb.....15@25c

Special Citrus Market Report

Los Angeles, April 17, 1917.

Shipments the past week were again heavy and the eastern markets under the increased offerings showed weakness. The actual declines, however, were light and confined mostly to the poorer offerings. Sales reported very good at the prices. Locally the market was very quiet. The best large sizes of highly colored oranges met fair demand, but small and medium sizes were very draggy. Grapefruit dull at 2@2½c per pound from growers in the grove picked. Tangerines were in light supply; offerings generally poor and hard to sell at 1½@1½c per pound in the grove picked. Lemons continue dull; but what are moving, sell at old prices, 1@1½c per pound in the grove picked for the best. Poor and culls sell for what they will bring.

San Francisco, April 18, 1917.

No price changes for oranges last week, but the cheaper grades of lemons and grapefruit advanced. High prices on lemons despite the absence of really fancy grades here.

FRUIT MARKETS U. S. AND CANADA PROMISE HIGH PRICES

After returning from a 13,000 mile trip in Eastern U. S. and Canada for the R. M. Tooker Co., G. A. Bolster writes us as follows:

"The impression I got in the different markets (and it is sustained by the business we have been doing this spring), is that there will be a ready market East for about everything in dried and canned fruits, beans, etc., that California can produce this year, and at good prices. It is very plain that labor is well employed, everybody busy, and in consequence money very plentiful, so that the people are in good shape to pay high prices for food products, and which they are enabled to pay by the good wages they are getting. It looks as though this condition might continue through this year anyway.

"In Canada I found the situation very much the same, except that so many men have been called to war that it will make labor very scarce for agricultural purposes unless they are able to bring in labor (Chinese or others), as I understand they are planning to do; otherwise the Canadian markets are in especially good shape for taking a liberal quantity of California food products."

Belgian Hares (live).....14@15c

BUTTER.

Butter closed the week at the same level as marked the opening, after having sold up as high as 40½ cents for the extras grade during the week. Shipping demands were responsible for the advances, the East and Pacific Northwest both being buyers here. Alaska business has been a little slower than had been anticipated, because of the difficulty in securing seamen to man the salmon boats. The most important announcement of the week was the awarding of government contracts to San Francisco firms calling for 80,000 pounds of butter. Of this the California Central Creameries will furnish 80,000 pounds for San Francisco delivery and 650,000 pounds for Eastern delivery and Monotti, Larimer & Solie 150,000 pounds for Eastern delivery. This will mean a cut in available Humboldt offering during the next two months of nearly one million pounds and is bound to be reflected in the future quotations.

Thurs. Fri. Sat. Mon. Tu. Wed.

Prime firsts.....38½ 38½ 39½ 39½ 39½ 38½

EGGS.

California poultrymen can certainly find no cause for complaint at the present trend of the market, with prices on eggs constantly advancing in the face of increasing receipts and with quotations at a record high level for the month of April. Shipping orders and liberal entries into storage are responsible for the better prices now ruling, and there is little in the present situation to indicate that any declines are to be expected for a time. Storage holding in San Francisco are now in the neighborhood of 45,000 cases, as compared with 41,000 for the same time last year.

CHEESE.

The big shipping call continues to send quotations up for cheese. The gain on Jack cheese has been especially marked and full cream stock is commanding 22½ cents per pound on the street at the present time. Flats fancy are quoted at 22 cents and Young Americas fancy at 25 cents, with prospects of both advancing within the near future.

EASTERN AUCTION SALES.

New York, April 17.—Fifty-three cars navel, thirteen mixed and four cars lemons sold. Market lower on oranges, unchanged on lemons. Weather fair. California navel averaged \$1.60@3.30. Lemons averaged \$2.20@3.25. Bloods, halves, averaged 95c@1.45. Tangerines, halves averaged 90c@1.50.

Boston, April 17.—Thirty-two cars sold. Market easy on oranges, unchanged on lemons. California navel averaged \$1.60@3.30. Lemons averaged \$2.25@3.00.

Philadelphia, April 17.—Eighteen cars sold. Market higher on oranges, demand good. Market stronger on lemons. California navel averaged \$1.90@2.80. Lemons averaged \$2.65@3.10.

DRIED FRUITS.

The dried fruit market was decidedly firmer this past week, partly the result of more activity on the part of buyers. Future peaches were advanced again and spot prunes registered a sharp gain. This naturally had its effect on the futures market and contracts for as high as 6¼ cents were reported. Spot apricots are cleaned out of this market and 15½ cents is freely offered for new crop goods. (Net to growers, bulk basis, f. o. b. shipping point.)

BERRIES.

Increased receipts have so far failed to break the prices on strawberries in this market, but the rate goods are coming to hand presages such a drop within the next few days. Longworths, Bauers, and Malindas from nearby points are being offered in a small way now, and quotable sized receipts of these will naturally mean lower prices.

LOS ANGELES.

Los Angeles, April 17, 1917.

BUTTER.

Receipts of week ending April 17, 291,680
Receipts of past week.....364,380

There was a stronger tone to the market throughout the past week. With receipts running lighter than last year and the Eastern and Northern markets all higher, caused dealers to bid prices up. San Francisco advanced 1½c up to Monday, Chicago 1½c and New York 1c. The high Eastern markets drew a number of good shipments East from California during the week and this, with a continued good demand for the Alaska trade and Honolulu, cut down the supply for the consumptive demand and influenced higher prices. The local demand was not heavy, the high prices causing many to resort to butter substitutes; or prices would have been still higher. As it is, values are now 14c higher than this time last year. Tuesday brought no change. San Francisco was off ½c, while the Eastern markets were firm; the result was the market here was made the same as the day before.

EGGS.

Receipts (railroads) for week ending April 17, 1917, 2,772 cases.
Receipts (railroads) for week ending April 10, 1916, 4,009 cases.

Market past week steady and firm throughout. Receipts much lighter than a year ago. Receipts for the week by rail were 2,772 cases and 2,400 cases of Petaluma were received to go into cold storages. The consuming trade took most of the fresh eggs. This demand, with a slight shipping movement, was sufficient to maintain a steady and firm market. San Francisco advanced 1c up to Monday and Chicago 2½c to 2½c and New York 1½c to 1½c on firsts. This also had a bullish influence, but at the present high prices there was little disposition to speculate on change. Tuesday, under light receipts and an advance of 1c in San Francisco, the market was bid up 1c and a very good demand was had at this improvement. But, as during previous days of the week, the demand was mainly from consuming trade.

POULTRY.

A more quiet tone pervaded this market the past week. No Eastern poultry in, but local receipts were better. The very high price of feed causing many poultrymen to trim their flocks closely. Young broilers coming in especially firm and are lower again. Fryers, too, are off and slow sale. All else steady but weak, and no urgency to the demand, the high prices causing consumers to take hold more cautiously.

We quote from growers:
Broilers, 1½ to 2 lbs.....29@30c

BEANS.

With seed time at hand and the new crop being contracted at high prices, which means an increased acreage, and the government in the market for beans for the

F. J. Kell Wins Rural Press Prize

Our records show that five grades in the herd owned by F. J. Kell, Stockton, had the highest average production for the month of March in the State Dairy Contest, viz., 71.050 lbs. fat, the individual cows producing 84.315, 78.566, 70.562, 65.838, and 55.967 lbs. fat, respectively. Mr. Kell is, therefore, entitled to the Pacific Rural Press prize for March. Four of the other herds competing for the prize last month were: Hollow-Hill Farm, Redlands, average production 59.649 lbs.; F. Stenzel, San Leandro, 58.024 lbs.; F. K. Abbott, Milpitas, 50.232 lbs.; J. Guill, Chico, 45.485 lbs.

army and navy, caused an active and sharply higher market the past week. Limas were advanced 2½c, large and small whites 2½c, and blackeyes and tepary 2½c per pound. Prices below are record ones on this market and firm.

We quote from growers:

Limas16c
Large white16c
Small white16c
Pinks12½c
Blackeyes10c
Tepary12c

HAY.
The market continues firm, but demand light and mainly from the country and for horse hay. Not much coming in; and the light offerings enabled dealers to hold prices up. Dairy people using but little cured hay, feeding mainly green alfalfa. Receipts 25 cars.

We quote f. o. b. Los Angeles:

Barley hay, ton\$21.00@23.00
Oat hay, ton22.00@24.00
Alfalfa, northern, ton20.00@22.00
Alfalfa, local, ton22.00@23.00
Straw, ton11.00@12.00

NEW VEGETABLES.
A number of new vegetables are now on the market. Asparagus is coming in freely and is lower, but in very good demand at quotations. New silver skin onions from the Imperial Valley are now on the market and are selling fairly. Cabbage is in good demand and higher. Not much really good arriving. A few new potatoes are on the market and sell in a fair way.

We quote from growers:

Cabbage, per cwt.\$4.50@5.00
Asparagus, local and northern, lb.6@7c
Imperial Valley, lb.5@6c
New potatoes, per lb.7@8c
New onions, Imperial Valley silver skin, per lb.9@10c

BERRIES.
Strawberry receipts continue to improve both as to size and quality. With the freer offerings prices are kept reasonable and the demand in consequence improves.

We quote from growers:

Poor to choice, per crate of 30 baskets\$2.40@2.75
Fancy, per crate of 30 baskets3.00@3.25

WALNUTS.
Little news is had as yet as to the outlook of the walnut crop this year, says Secretary C. Thorpe of the California Walnut Growers' Association. The season is late, but as far as learned the frost did little damage, not over 10 per cent. Setting is very good. Prospects are for a good crop, unless blight, aphids, or heat interfere.

HONEY.
Reports from the country indicate no improvement in the crop outlook since our last report. The shower of last week was not sufficient to do any good. The season is said to be fully thirty days late. No extracting has been done; hence we are unable to give quotations. Indications are that the sage honey yield will be especially short. Bees have had slim pickings so far.

SHEEP.—Four decks of prime shorn lambs brought \$11.25 and a load of old ewes and bucks \$9.75. A few spring lambs brought 15c last week.

Publisher's Department.

We congratulate you on your last issue of the Rural Press. It will no doubt be a big boost for the swine industry of the State.—Elmer Lamb, Ceres.

We believe in complimenting a good thing when we see it, so we want to compliment you upon your special hog number, out today.—V. R. Churchill, Honig-Cooper Co.

That was some issue.—R. H. Whitten, Los Angeles.

Your swine edition of the Pacific Rural Press, I consider the very best effort of this nature I have ever seen.—A. M. Henry, Farmington.

The swine edition of the Rural Press is an all-around first-class number and reflects credit on the publishers for the enterprise. It should prove of great benefit.—J. W. Henderson, Berkeley.

I think the swine issue was a complete success. Keep the good work going.—John P. Walker, Visalia.

HIDES are meeting stronger demand, and Butchertown January hides were recently sold. These were the oldest on hand there. Green salted cow and steer hides are bringing about 25 cents in the country.

Los Angeles, April 17, 1917.

CATTLE.—Rather quiet and weak mar-

ket past week. Scarcity and high price of feed caused freer offerings of beef steers, and as the demand for beef has fallen off killers held back and were more exacting in their purchases, but paid unchanged prices for all fat killing steers. Cows and heifers also unchanged, but slow sale. Calves coming freely due to high price of feed. Market slow and weak.

Per cwt. f. o. b. Los Angeles:

Beef steers, 1000 to 1100 lbs.\$9.50@10.00
Prime cows and heifers7.50@8.00
Good cows and heifers7.00@7.50
Calves8.50@9.25

HOGS.—No change in this market from a week ago. With a falling off in the demand for fresh pork and most of the hogs coming in light weights, killers refusing to advance prices, notwithstanding the high markets East. California and Arizona furnished what hogs are coming in. But few really choice packing hogs arriving; and for such a premium was paid over quotations below.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 250@300 lbs.\$11.50@12.00
Mixed, 200@250 lbs.12.00@13.00
Light, 175@200 lbs.12.00@13.00

Rough docked 20 pounds piggy sows 40 pounds and stags 40 per cent.
SHEEP.—Steady and rather firm market past week. Receipts only moderate of aged sheep and yearlings; and they were in very good demand. Killers all wanted supplies. Spring lambs coming more freely and quality not very good. Hence a slow and weak market, though prices not notably lower.

Per cwt. f. o. b. Los Angeles:

Prime wethers\$9.00@10.00
Prime ewes9.50@10.00
Yearlings10.50@11.00
Lambs13.00@14.00

North Portland, Ore., April 16, 1917.

CATTLE receipts today were about 800 head, the quality of which was very good. Demand excellent and trading very active. Prices on all grades ranged 25c to 35c higher than last week. One load of prime grain-fed steers brought \$10.25, a new record top, while there was a good spread of prime steers which sold at \$9.80 to \$10.15. Good steers brought around \$9.50, while medium grades brought from \$8.75 to \$9.25. Very few cows and heifers on the market, with a very brisk demand. Best cows brought \$8.75 and \$9.00. Medium dairy cows brought from \$7.25 to \$7.75, with common stuff down to 6c. Fair supply of bulls, with a good demand. Best heavy bulls \$7.25, with a considerable spread from \$5.40 to \$6.50. A few good calves sold at \$9.50.

WHEAT AND FLOUR SITUATION SERIOUS.

Flour advanced 20 cents three times in past two weeks. Now \$10 a barrel wholesale. Government reports California wheat, April 1, 83 per cent normal; ten-year average, April 1, 83 per cent. United States wheat, 63.4 per cent normal; ten-year average, 86.2 per cent. California average price, April 1, 1917, \$1.55 per bushel; April 1, 1916, 95c per bushel; United States, April 1, 1917, \$1.80 bushel; April 1, 1916, 98.6c. Chicago wheat, May, 1917 delivery, \$2.05 per bushel. Exports seven months ending January, 1915, 168,289,116 bushels; same period 1916, 103,945,271; 1917, 90,166,662. Last year exports four months preceding harvest, 79,000,000 bushels; this year only 66,000,000 bushels available for home use and export, corresponding period.

Up-to-Date Harvesting

MARTIN GARN, who realized that his opportunity had come for cutting out a lot of the old delays, worries, and high costs of his yearly harvesting, invested in a **Deering Harvester-Thresher**. His success with it is told in this letter:

American Falls, Idaho, Aug. 23, 1915.

The Deering Harvester-Thresher, purchased from the International Harvester Company, has proved very satisfactory, having cut about 150 acres, averaging about 15 acres per day, with but one man, cleaning and saving the grain better than any thresher I have operated. The machine is very economical, being the cheapest way of harvesting I know; the same is true of the cost of help. The saving in my thresher bill for this year will more than pay for the cost of the machine, in addition a great saving of work in the house has been made, and in the feeding and help that is required for the old-time way of harvesting. Yours truly,

MARTIN GARN.

Do your harvesting and threshing in one operation, turning the old unnecessary threshing expense into clear profit, saving time, doing away with the risks of long-drawn-out harvest. Own a **Deering Harvester-Thresher** for this year's harvest. Let your threshing bill saving pay for it. Write us for folders.

A Banker's Experience in Financing Dairy Farmers

[Written for Pacific Rural Press.]

IF YOU have ever bought a sewing-machine, a set of books, or an automobile on the installment plan you have

a pretty fair idea of the way farmers in Glenn county with little or no funds have been, and still are, getting into the dairy business. The difference lies in the fact that the installments are paid by the profits from the purchases.

Back in May, 1913, there were 300 dairy cows on the Government reclamation project adjacent to Orland. As this is written, early in 1917, there are over 4,000 dairy cows on the same project. Two years ago creamerymen estimated that the average yearly production of all cows on the project was 175 pounds of butter fat; now they believe the average will run close to 275 pounds of fat per cow per year. Before the dairy cow stampede started in the Orland district, the new settlers had been selling their hay. Then prices took a tumble, and it looked pretty bad for awhile. They needed cows and needed them right quick. They got the cows all right; but many of them were of a poor sort, as is usual when buying is necessary in years of low hay values. The fact that they got poor cows is nowhere near so surprising as the fact that they had the money to pay for them, and that is where the country banker enters into our story.

A Cow Bank.

In May, 1913, an institution was established at Orland known as the First National Bank. Like any other bank, its primary object was to loan and borrow money. Its organizers believed that the best way for a bank to make money in a farming community is to do business with the surrounding farmers. But they quickly discovered also that a farmer doesn't have money to bank unless he is making money by his farm operations; and that in a new district there is nothing which quickens financial returns like a little ready money. You see, country banking is a kind of wheel within a wheel—the banker loans money to the farmer, the farmer invests the money to make more money to deposit with his banker to loan more money, etc. In other words, what is good for the farmer is good for the banker.

Now it holds just as true in banking as in any other business that the easiest thing to sell is what your customer is wanting most badly. Just at the time this bank was getting started the alfalfa growers needed "cow money"; also, the bank needed business; so, casting local precedent to the winds, they began financing dairy cow purchases. While in most cases the farmers selected their own cows wherever they could find them for sale,

How a country banker's policy of "what is good for the farmer is good for the banker" has worked out with financial gain to all concerned. Cows pay for themselves on the installment plan.

securing the bank by a chattel mortgage, yet in some instances they were bought by the bank and re-sold to the farmers on a "cow lease note," said sales being made without profit to the bank.

The Cow Lease.

A contract or lease note is in reality a promissory note bearing interest and providing for payment of the principal in monthly installments. When all of the payments have been made in accordance with the contract, the cows become the sole property of the dairyman. Until then the note is secured by the cows and their natural increase, the bank having the right to take possession of the stock at any time the dairyman fails to make

his payments. To further safeguard the banker, an agreement is made whereby the dairyman agrees to allow the creamery with which he does business to segregate a certain percentage of his monthly cream check and turn it over to the bank to be applied to the interest or principal of the note.

So much for the legal side of the transaction. When we interviewed Jno. J. Flaherty, cashier of the First National Bank, we discovered that the moral character of the borrower is far more important than the signing of a name to a contract, although that of course is essential from a banker's standpoint.

The Real Risk.

"The borrower's moral character enters into every loan made by a bank, and that applies to loans on all kinds of personal property, whether it be dairy cows or household furnishings," he says. "It is easy for any bank to find out the moral risk of a borrower. If he enjoys a good reputation in the community, he's a good risk; but if he doesn't, a loan is bad business, even if you have him tied up

with all sorts of legal documents. When we find a prospective borrower is all right, that he has feed and barn room so that we know the cows will have a good home, we never hesitate about loaning him money for dairy cattle; and in all of our transactions, which involve many thousands of dollars, we have never lost a five-cent piece, or had a cow come back onto our hands.

"While each farmer does his own buying, we make it a point to protect him as much as possible in his selection of cows so that he won't buy 'boarders.' While it is his money that is involved, we suggest that he buy a purebred bull and enter his herd in the cow-testing association. We have two reasons for this—first, the better cows he buys the more certain he is of succeeding, and the better we consider the risk; second,

(Continued on page 544.)

Stanislaus county is proud of its herds of Purebred Jerseys.

Jerseys are popular in all the dairy districts of California.

THE DRIVE FOR FOOD SUPPLY.

THE state-wide information and exhortation rally on the general problem of increasing food production in California which has lifted its voice in nearly all the counties during the last two weeks has reached as good results as could have been reasonably expected from it. The leadership of the College of Agriculture in this wake-up patriotic effort has been recognized by people generally as a proper manifestation of spirit and will to serve and the co-operation of various State executive departments, at the invitation of the college, has been widely appreciated. There has never been since the establishment of the college a better demonstration of the desire of the institution to draw near to the practical farmers and help them in their important service to the national welfare. In this respect the present administration reflects the spirit of the pioneer workers in the college and adds indisputable testimony to the value of its own motive and force in the wonderful development which it has achieved. As was to be expected, the farmers rallied warmly to the call for patriotic attention and co-operation and in the valley communities not less than 500 people assembled at some of the meetings. Early indications from these meetings, reports of which will be formulated next week, are that California farmers are wide awake to their duties and opportunities; that they are expanding their crop areas to the limit of their abilities and foresight of what is practicable at this season of the year; that, as a rule, they cannot do more on the land with the funds, implements and power now available to them and that they are really going hopefully beyond what is now in sight as available labor supplies. At one of the closing meetings held in this city, Dean Hunt impressively declared that the country is now doing all that it can: that everything reasonably possible for this year's planting has been done; that more work and new work must now begin for the cropping of 1918 and if anything notable in subduing new land is to be accomplished it is up to the city, not to the country—for the city has the money, the labor and the control of gasoline and electric tillage machinery as a substitute for work-stock of which the country has been depleted for distant war purposes. Therefore, as the city has the preponderance of population, and wealth, of available labor and of the new agencies of power, it is up to the city to act in the interest of its own future comfort and, in a broader way, it is up to the city to insure the survival of popular self-government in the current crisis of affairs.

MORE HASTE, LESS SPEED.

WE ARE glad to present the foregoing outline of Dean Hunt's conclusions from the wide rural conference and inquiry which has been made under his direction: first, because it is rational and cool and carries its own demonstration of true conception; second, because it conveys a true answer to the hysterical outcry about "speeding up the farmer," with which so

many are piercing the public ear—creating a popular impression that the farmer is a balky horse and can be started by building a fire under his tummy. It is almost incredible to what extent this foolishness can go. Even this was publicly said in Chicago last week:

"Farmers are not feeling the pinch and many of them are not awake to the situation. They, of course, will be the last to suffer in the case of food scarcity. It doesn't matter what it costs to produce. Money is only exchange, and if it should cost \$2 to produce \$1 worth of foodstuff it must be done. People can eat food, but not money. Cost should not be counted now. The world must be kept from starving."

Of course, if a man has the money and desires to blow it in that way for his own eating, we have no objection. In fact, we would rather commend the outcry as a slogan to those who are now so crazy about vacant-lot farming as a national relief, for it is in that activity that cost double the worth of the product is not only good judgment but eminently possible of realization. But the suggestion that farmers must be awakened to the pinch of doing that to save the life of the non-producing patriot, betrays a conception of the farmer's relation to the consumer which would do credit to Tiglath Pileser, the old Assyrian kaiser who not only forcibly possessed himself of the food supply of his conquered territory but deported the growers themselves into bondage. It may seem more merciful to do up American farmers in an economic way, but the difference in cruelties reached in both cases is not great. It ought to be very clear that the well-established farming industry, which is such a great credit and resource of the United States, should not be belabored by visionaries nor exploited by mistaken theorizers about the public welfare. If anything comes from the reasonable claim that urban consumers should bear their burden of the proposed effort for greatly increased food production, it must be remembered that it is impossible to achieve anything by plunging and that true speed is only attainable by employing the principles of science, mechanics, economics and hard work, which constitute good farming.

WHAT FARMING WILL GAIN FROM THE WAR.

SPEAKING of Tiglath Pileser reminds us that civilization will emerge from the fiery furnaces of this world war refined and tempered for higher service to mankind. Statesmen and philanthropists clearly foresee this and it belongs to them to describe and interpret their visions. In the relations of productive industry to human progress there will also be clearer seeing and more definite understanding than hitherto. In the particular branch of industry which feeds mankind we see great gains coming, which will ultimately accrue to the increased safety, comfort and peace-force of the human race. Agriculture has advanced from prehistoric times through hard knocks from warriors, despots and class-dominators. Ages ago peaceful food-producers were despoiled of their property and enslaved by lean and hungry nations, rushing in upon them with fire and sword. In more recent times they have been plucked of their prosperity by financial and commercial over-lords and held in helpless bondage by unyielding social discrimination. By such inhuman arts and forces, the multitude has been crushed beneath the heel of the few for millenniums. Philosophy, oratory, poetry and the pictorial arts have all been invoked to promote tranquility so that inhumanity might endure. Even after physical oppression largely ceased in civilized nations, economic and social oppression continued; partly because it was popularly regarded as more merciful; partly because it was discerned to have a finer cutting-edge than physical cruelty. Even in America, where, if we mistake not, all farmers first rose to political equality with all other men, financial and social inequality, in certain degrees, continued in public point of view and practice, though officially declared non-existent. In Europe the general farming population has always remained under discrimination, which ranged from serfdom to a kind of patronage called benevolent and beneficent. During the last half century farmers have advanced in public estimation everywhere because of their affiliation with research in natural science and their use of the

results of such research in the improvement of their viewpoints and operations. Natural science has exalted farming in the public mind and advanced the farmer in self-confidence and in public esteem, as the man who made largest and most varied use of its achievements in human service. Through all this progress there still remained financial and commercial unfairness, which now seems to be disintegrating, but to this moment has persisted the old idea of Tiglath Pileser, and his like in the world, that the food producer was a perpetual-motion organism to be robbed of its product or carried away by conquest to produce wherever the conqueror might set it up to his own advantage. The experience which the world is gaining in this war of the relation of the food producer to the success of all human purposes, and especially of his relation to statesmanship and public policy in this country, as emphasized by the agitation and legislation of the current month, demonstrates beyond question not only the fundamental character of the industry in human affairs, but the related fact that world-dependence, which every other producer strives to gain for his commodity as his surety of patronage and profit, is the natural endowment of food products. The business advantage of producing such commodities, as soon as the people fully realize that it is neither fore-ordained nor automatic, but is the achievement of insight, energy and enterprise, will be properly recognized as the field incomparable in material manufacture and trade. As a result, then, of the world's greatest war and of the adequate appreciation of its relation to the achievements thereof, farming will come into possession of its own—recognition as the greatest business, the greatest material activity and the most honorable and indispensable in the world. The fact is old as history: the measure of the fact is still coming.

* * *

THE FRUIT HARVEST AND THE LABOR SUPPLY.

IT HAS required some speed to rise from Tiglath Pileser to the aftermath of the present war in a single paragraph, but we are still able to see things on the earth as well as in the clouds. And what strikes us as perhaps the most important thing on the California landscape at this moment is the mobilization of help for the deciduous fruit harvest which will begin this week with cherries and continue for about six months. Though there have been some local injuries by frost, there will be lots of all kinds of fruits and there has never been a year when prospective prices seemed to warrant putting every pound of it into some edible form as now. All kinds of sound dried fruits promise to be in demand at prices which will warrant putting time and money into securing them in good condition. If one has leisure time he should keep busy repairing and extending his tray capacity, sulphuring outfit, etc., and should make sure that he has tools and supplies ready to handle everything that ripens fairly and is not handled in fresh-fruit ways. He should also make sure whence his labor supply is coming. Much can be done in interesting women and children in neighboring towns by early offers of good pay for their work and arranging neat, sanitary lodgings and attractive eating and recreation places for them. If this is done in time, doubtless thousands can be beguiled from mountain and coast camping places and led to give the summer to fruit work with great advantage to themselves, to you and to the flag. It seems likely that the eight-hour day for women and children will be waived and all good workers allowed to make all they can if their living places are commendable. It is also likely that school vacations will be reasonably adjusted to the current need and that thousands of husky school boys can be interested in the heavier parts of fruit work. No time should be lost by individual fruit growers in forecasting their needs for help and taking steps to secure it, and no doubt a surprising amount of available help can be disclosed, if growers go about it early in ways to win. Fruit growers' associations also should push organized efforts in all directions. If growers go about it right, they can probably make much more money by saving the fruit between the rows than by the intercropping which the ex-

horters are so eloquent about. If every fruit grower goes about this matter the best he can, he will be in better shape to be helped by the wider work which the county committees of defense will undertake in all parts of the State, in case he should not be able to compass his own needs. So far as disclosed, the attitude of the labor organizations is likely to be helpful to the growers and loyal to the needs of the country in war time. It has been said for them that they are willing to do the work there is to be done and are disposed to leave until after the war some of the extreme points in length of hours and compensation which they have been contending for. The main point at once for the growers is to figure closely on the help they will need and get it if they can: to get all needed appliances and supplies beforehand and arrange for the decent care of the people who will work for them. Readers will be welcome to make practical suggestions along this line, that we may publish them for the general benefit of all concerned.

LOOK TO YOUR CONTRACTS.

WE SUGGESTED some weeks ago in connection with contract-selling, which is always easy when prices are up, that all readers should exercise due diligence that these elusive documents are something more than "scraps of paper." We repeat the warning because we hear that the country roads are full of smooth, rapid

people trying to get signatures to contracts for crops from plants which are not yet above ground—even from plants of which the seed is still in the sack. Of course, when one is to make extra effort and expenditures for a crop it is comfortable to have the buyer take the chances on a price which is sure to be profitable to the grower. We are not objecting to that, nor are we encouraging anyone to gamble as against a sure thing, though we do confess some admiration for the grower who has the courage to say: "It is my principle to sell a crop when it is ready." But when you are going on the sure-thing line you ought to be sure that the terminus is a sure thing! Some contracts are funny if one has an eye for the humor in them, but worse than that, perhaps, is a contract which is not a contract at all because there is only one responsible party signing it and that is you. Any selling contract is worth no more than the buyer who makes it—unless the price goes up, and then he may be able to sell it for more than his whole family is worth for movie actors. And if the price goes up the contract is a loss to the seller to just the same extent. Therefore, a seller should never make a contract unless he knows the contracting buyer is responsible and it is his business to find that out before signing. If you do not do that, you are up against this: if the price goes up he will find you all right; if the price goes down you can't find him; and if it is a matter of beans, you will know them next time.

When to Irrigate Prunes.

To the Editor: Kindly tell me the best time to irrigate prunes. The soil is a deep sandy loam. I have plenty of water now, more than I shall have in two months or more. The prunes are now as large as "bee-bee" shot. Would you advise irrigation now?—Grower, Chico.

The principal thing to secure in the timing of irrigation is to restore the soil moisture before the lack of it has induced the plant to reduce its activity and assume the preliminary phases of maturity and dormancy. To keep the plant awake and active through the season gives better growth and crop than to bring the plant back to action after slowing down. For this reason it is often necessary to irrigate without reference to the particular stages of growth in which the plant may be in. In your case, then, whether you should apply water now or later depends upon two things: First, whether the soil is now plentifully supplied with soil moisture or not; second, whether you must irrigate now, for fear you may not have water available later. In either of these cases irrigate now. Otherwise it would be better not to irrigate until the crop has passed through the spring drop and is seen to be well set for the season. In this, as in all other particulars, irrigation is a matter of fact and judgment about conditions and not a matter of rule or schedule.

Brown or White Gyp Corn.

To the Editor: Is brown Egyptian corn desirable to plant instead of the white, as birds do not damage it so much? How is it for stock feed in general as liking is concerned and for fattening hogs?—M. V. W., Fresno.

If you will read again the discussion of sorghum growing on page 298 of our issue of March 10 last, you will see that brown gyp is a good cropper, but not so good a feed because of the amount of tannin, which is liable to disarrange the functions of the animal unless fed with laxative foods like oil meals or alfalfa. For this reason the white grains are preferred and stock generally take to the more inviting grain more readily. Still, if the birds do not leave you enough white corn, you will be better off by growing the brown. Many growers make this choice.

Olives with Wet Feet.

To the Editor: Please tell me what is the matter with my olive trees, which are dying back. In the summer they stand in water for about three days when I irrigate. Would you cut them back?—W. H. D., Hemet.

Knowing nothing more about conditions than your statement imparts, we conclude that your trees are dying back because of root injury caused by standing water in the soil. If the water stands where you see it for three days it is probable that the soil is full of water and scant of air for a much longer period. This is liable to give almost any tree root-failure and die-back. Cut back the trees and apply hereafter just enough water to deeply wet the soil and no more. If the trees are in a dip, where water collects in spite of caution in applying it on higher lands, the place should be under drained to a depth of three or four feet to quickly draw away the surplus water.

Beans and Sorghums in Hills.

To the Editor: Please state how many seeds to the hill and distance of hills apart to cultivate both ways, with soy and tepary beans and for milo. Also depth to cover on moist, wet land which cannot be irrigated.—E. P. T., Pacheco.

Drop four or five seeds in hills 30 inches apart each way on such soil, or 40 inches apart on drier soils. Cover about two inches on such soil and three or four inches on lighter, drier soils. Of course, the seed must get down in moist soil, but do not cover too deeply at first—the soil can be leveled later by cultivation.

California Weather Record

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., April 24, 1917:

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Excess Lime in Bordeaux Mixture.

To the Editor: Does extra lime used in making Bordeaux mixture reduce the strength of the bluestone?—A. G. T., Vacaville.

It does not. The function of the lime is to prevent injury by the bluestone to the leaves of the plant to be protected and still to release the bluestone with sufficient fierceness to destroy fungus forms. The formulas for the Bordeaux mixture represent the best ratio of bluestone to lime to accomplish these two purposes most quickly and effectively. If excess of lime is present the bluestone cannot be so quickly dissolved out of the embrace of the lime and the lime therefore delays the fungicidal action of the mixture and, in the the presence of moisture enough, continues such action over a longer period. It may be likened to the amputation of a dog's tail. If you use a dull knife it will take you longer to get through the hair to the real tail and then the knife will act through a longer period in getting to the other side of the tail. Dulling the knife cannot, however, be said to have reduced its strength—for the tail is just as surely off as though it went through with a flash. It is not the lime which reduces the strength of the mixture: it is reduced relatively by using a larger amount of water. But the use of much excess lime is not desirable: it delays action, and it makes spraying much more difficult. Excess lime is also more likely to flake off in dry heat and take the bluestone away from its job.

Planting in the Moon.

To the Editor: Will potatoes do as well planted in the light of the moon as in the dark of the moon, or is there nothing in the old tradition? I cannot get my ground ready before the 21st inst. and there is a new moon on that date, so am wondering if it will make any difference, or should I wait until after the moon fills?—Subscriber, Upper Lake.

There is a little advantage in planting in the dark of the moon because seeds planted then are up and the plants ready to take advantage of the small contribution which the moon makes to available light. Light is an indispensable factor in plant growth, whether it comes from the sun, the moon or, an electric bulb. But light is of no avail to a plant unless heat and moisture are right for its activity. Therefore it is far more important to take advantage of good conditions in the air and the soil than to watch the moon. Plant your potatoes as soon as you can and let the moon show the Germans which way to run.

To Make Large Apricots.

To the Editor: I have about 750 apricot trees, seven years old and twenty-five feet apart each way. About 500 of the trees are very heavily loaded. Is there any commercial fertilizer that could be used right away, so that I may have larger apricots from its use? If there is such a fertilizer, would you put it in the furrow before the irrigation or after the water has been used?—Grower, Hemet.

Such purpose as you describe can be well served by using two pounds of nitrate of soda and three pounds of superphosphate per tree. Scatter the mixture evenly over the ground occupied by the tree, beginning about two feet away from the trunk and extending about as far beyond the spread of the branches. Do this before furrowing for irrigation and whatever remains dry after the run of water will be covered into moist ground by the cultivation which should soon follow. Application in the furrows is apt to result in less equal distribution. Apply as soon as the fruit is seen to be well set. Of course, such treatment cannot be expected to enlarge all the fruit which may be set on a tree. Proper thinning must be done, if necessary, to give three or four inches distance between fruits, and the tree must have plenty of soil moisture to bring its crop to good size.

Grinding Vine Prunings.

To the Editor: Has anyone ever made a brush grinder to powder grape prunings for the benefit of the soil, instead of burning, as we do now? The idea I have is that someone has invented an implement that can be driven through the vineyards, grinding the brush as it goes, and the ground prunings dropped to return to humus. Has this ever been done?—W. M., Fowler.

We have recorded in previous issues that cutters for prunings, like hay or straw cutters, have been mounted on wagons and operated in reducing both vine and citrus tree prunings to inch lengths and scattering them for plowing under. We have not at present information as to how long they have been used nor how valuable the practice has been found to be. Such information would be interesting. Theoretically it is a very close question as to whether such material is actually worth the investment and labor which it requires to reduce it to available forms. Our judgment is that it would not be practicable to grind sappy stuff without drying and that it would not pay cost and operation of the mill, labor and power required. Who can claim otherwise from experience?

[Written for Pacific Rural Press.]

Whether all prune and apricot growers shall indefinitely share the price of their fruit with speculators who hold down prices and do not provide for the greatly increasing acreage, depends on a great many growers of small acreage who must join the Association before May 1 or be responsible for calamity to all the rest. Calamity it will be, not within a year or two, but when the orchards recently planted shall have come into bearing.

If 75 per cent of the bearing acreage is signed up May 1, all members will receive 4 and 8 cents on delivery for prunes and apricots respectively; and as soon as the fruit is sold will receive all the remainder

that it sold for, less a very small proportion for Association expenses. Advertising and consistent marketing endeavors will increase the demand.

Cash subscriptions are not worrying those who have been elected the leaders; for the required amount is already nearly subscribed.

But the acreage is not. The trustees will meet April 30 to determine whether the required 75 per cent has been secured.

Meanwhile it is up to every believer and every member already signed up to sacrifice a day or two in urging unsigned neighbors to aid

in this insurance of prosperity for future years.

Orchard owners especially must realize that the high value of their investments depends on the organization.

Much money has been spent, much valuable time has been freely given, to safeguard in this way the industry that involves an annual turnover of \$15,000,000 in California.

If you have been hollering about the middleman, it will be to your everlasting discredit if you do not seize this opportunity to eliminate the unnecessary middlemen in the prune and apricot industry. If you devote the next two or three days to consistent work with unsigned growers, you will always be proud of your public spirit.

Summer-Prunes Vigorous Apple Trees

[Written for Pacific Rural Press.]

"While apple trees are young and vigorous, I would certainly summer-prune them," says J. W. Fulton after his experience on a four-year twenty-acre orchard in the Yucaipa district.

It greatly reduces the waste wood to be removed in winter, besides directing the growth of the tree as desired. Thus it really adds strength and size to the tree. The winter wounds are smaller, easier healed over, and less likely to be infected with decay fungi.

The orchard includes ten acres of Rome Beauties and ten of Stayman Winesap, Arkansas Black, Black Ben, Vanderpool Red, and two rows in which are 86 varieties. It is irrigated from pumps.

The Summer Pruning is done at two times—in June and again in August. At the first pruning, the new growth is eight or ten inches long on the average. It is not cut back, but thinned out lightly and quickly to keep the trees open enough but not to allow sunburn. Suckerous growth especially is removed. The only cutting back at that time is to direct the growth of undesirably-pointed limbs into another direction. Rome Beauty especially is hard to spread enough, so all cutting back is done to an outside bud. The Winesaps naturally spread, and may need directing upward. A branch may be growing in a direction where it would cross

another by winter and have to be taken out then. There is much less wasted energy if it is cut out early. Late in August comes the really vigorous pruning, when the new growth is two to four feet long. It is cut back and thinned some more. Then in winter there is only some small brush to cut out. The Rome Beauties produced 250 boxes of apples last year.

In the first years of Mr. Fulton's trees the wood was not cut back enough, and it produced too many laterals, which would make the tree overbear if allowed to remain. Many of these had to be sacrificed by cutting the limbs back at a later time to the right length. The time will come when the trees will not produce excessive growth, and then summer pruning will cease.

R. N. Boggess, also of Yucaipa, does not get so much growth after winter pruning as his neighbors, who prune more severely, but he thins out the new shoots soon after they come, and keeps it up as they come all summer. This also keeps the tree's energy going principally into those branches which are to be permanent.

G. E. Jenkins, who pruned young apple trees for fruit-wood two years ago by cutting the inside growth to stubs three or four inches long, found it necessary to go over the trees three times the following summer to thin out the shoots and suck-

ers. Last summer there were only a few suckers to take out. This left the orchard with a heavy setting of fruit-wood last winter.

A record of costs of operation helps tell where the leaks are.

Aphids cannot be commercially controlled on trees after they have curled the leaves over themselves.

Plant Your POTATO Land When Crop is off to

RHUBARB

If planted then you can expect BIG PROFITS by fall or early winter. OTHERS MAKING \$1,000 PER ACRE ANNUALLY—SO CAN YOU. Don't put it off any longer. April-May-June positively best months to plant. WRITE

Plowed Walnut Cover Crop in May.

[Written for Pacific Rural Press.]

Why people who have plenty of spring irrigation should be in a hurry to plow their cover crops under, seems rather hard to learn. Very often over half the value of a winter cover crop is not obtained, because after spending the labor and money of seeding, people plow the cover crop under when half mature. A. M. Hoefer of Orange County is one who last year got full benefit of the cover crop by not plowing until May as planned when our representative visited him in February. He has an orchard of 12-year Santa Barbara Softshells with an 8-year Valencia planted in the center of each square. (He would not do this again on account of inconvenience.) There are six rows of walnuts about 650 feet long. In May, before plowing, Mr. Hoefer planned to run water through the 16 furrows per center,

for two weeks if necessary, to soak it well. Then he expected to plow under the maximum desirable cover crop growth (which was melilotus indica two feet tall in mid-February). After plowing and working the land down, he expected to irrigate as usual, three times. Four furrows each side of the orange trees and a couple of feet apart would be used for the first two irrigations. About 25 miner's inches would run through all 48 furrows in about 36 hours, as he would turn small streams into each. The last irrigation would extend clear up to the walnut trees. This would give them a thorough soaking which would help make the hulls pop open at maturity. The land is a sandy loam in which the water soaks downward faster than sidewise, so it needed much additional humus.

Value of Frozen Oranges.

[Answered by E. M. Chace, Citrus By-Products Laboratory, Los Angeles.]

To the Editor: What is the value of frozen oranges as fertilizer? About what per cent of oranges were frozen last winter? What by-products are manufactured from frozen and cull oranges, and is there a factory in the State for same?—A. A. B., Reedley.

Frozen oranges have some value as a fertilizer, but the weight of opinion seems to be that they should be neutralized with limestone or other alkaline material before being placed on the ground. In order to move the fertilizer from the place of manufacture to the grove, it must be more or less dried, which tends to raise the cost to such an extent that it is questionable whether any saving could be accomplished.

The Exchange By-Products Factory at Corona, Cal., for some time gave their waste lemon pulp to growers in that vicinity who were willing to haul it away from the factory. At

present, I believe, they are drying this material with a view to its utilization as a fertilizer. With by-product factories the problem of disposing of the waste is rather serious, and if it can be utilized as a fertilizer they will certainly do so.

Where frozen oranges have not become desiccated, they may be used in the manufacture of vinegar, and the peel may be dried, candied, or put up in brine. There are several factories in Southern California which are utilizing cull fruit in the manufacture of orange peel, but it would not be possible to transport the fruit from Reedley to the southern part of the state for this purpose. I know of no by-product factory in Central California.

[Probably not over five per cent of the oranges of the state were frozen last winter.—Editor.]

GRAPE ROOT WORMS.

[Written for Pacific Rural Press.]

Were your grape leaves last season laced with long narrow spots eaten from their surfaces, and perhaps the grapes marked with long narrow brown blotches? These marks

were made by the black or brown beetles which are the adults of the grape root worms. These work underground all summer after some time in June. The adult beetles emerge from the ground in May and do their damage while preparing to lay their eggs.

The adults on vines "play possum" when disturbed, and drop to the ground. This is the means of their destruction as described by Horticultural Commissioner H. H. Ladd of San Joaquin County. Two sheets of galvanized iron about 2x4 feet are notched at the center of one side of each so that when placed under a grape vine, they fit close together with a hole in the center for the vine. The upper surfaces of these sheets are smeared with crude oil. The sheets are shoved carefully under the vines, and the vines shaken to induce the beetles to fall into the oil. They can then be destroyed at leisure. This is best done when most of the beetles have emerged from the ground but before they have damaged the fruit.

Don't leave borers in your fruit trees. Inspect them for the frass at the base of their trunks, and when you find it dig the worms out with wires. Then cover the wound with asphaltum, grade c or d, to keep out others.

Tree Protectors

That Really Protect

Quickly and easily put on. Will stay.

Fitted with galvanized wire ties.

If you want better protectors for less money write us for sample and prices.

Patent applied for.

Angelo & Son

Bay and Mason Sts.,
SAN FRANCISCO

The men who sold you your fruit trees say:

"Your trees must be planted *right* if they are to thrive. Make the holes deep and wide and break up the subsoil. The best way to do this is by blasting."

Nearly every Western nurseryman uses and recommends blasting for tree-planting. "We know the value of such work," say Fancher Creek Nurseries, California. "We favor blasting," says Oregon Nursery Co. "Blasting is important," says Puyallup Nursery, Washington.

Blast with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

—which do their work cheaper and *better* than ordinary dynamites. These improved explosives—made in two brands, Eureka Stumping Powder and Giant Stumping Powder—are prepared especially for Pacific Coast farm work. They pulverize the soil several feet deep and wide, and place it in the best condition to insure the rapid growth of trees and crops.

Be careful to get the genuine, made by the company which originated all "giant powders." If your dealer has only ordinary dynamites, write us and we will see that you are supplied with the *real* Giant Powders.

Get Some of These **Five Free Farm Books** Get our valuable, illustrated books. They tell how to save money by using Giant Powders for Boulder Blasting, Stump Blasting and Ditching, how to grow bigger farm crops by blasting the subsoil and how to blast in new or old orchards. Mark in coupon the subjects that interest you, and the books will be sent free.

Plant Citrus Trees with Pedigrees

If it did not cost so much to produce our trees, we could sell them at competitive prices with other nurseries.—why, our methods of selecting our budwood alone would sell our stock. We have had over 20 years' experience in Citrus Trees, and were among the first to advocate bud selection from fruit-bearing wood. The price of the tree is the smallest item in the cost of bringing into bearing. Fertilizer, labor, investment tied up in land—these are the big factors that go to put it, years after the trees are planted, the grove bears miscellaneous offspring.

Fruit, Grain, Hay, and Field Crops Report

[Written for Pacific Rural Press.]

A study of the report below will show very short crops in the State as a whole, for almonds and apricots due to frost. Seriously short grain and grain hay crops are due to drouth and there is a marked advantage for that sown early on summer fallow. Shortage of alfalfa is due to late-continued cold. Potato acreage planned will not exceed last year, but bean acreage may easily be double that of 1916. Wherever water is available, sorghums and Indian corn will be planted.

The detailed reports given below and segregated according to crops, have been gathered largely by our large force of men traveling all over the State; but in addition, we wish to thank the many subscribers and friends whose letters have supplemented and corroborated the observations of our staff. The reports embodied below were generally made late in the week ending April 23.

Almonds.—Butte, 20 per cent. Colusa, not frozen so hard as previously thought. Contra Costa, 80 per cent, frost in limited areas, Antioch and Brentwood good. Riverside, Hemet look good. Sacramento, 30 to 50 per cent of normal due to very heavy rain in blossom like that of three years ago. San Benito, normal condition. San Bernardino, good. San Joaquin, good. Stanislaus, good setting. Tehama, 25 per cent.

Apricots.—Alameda, Haywards hurt by frost and dieback. Niles, good. Contra Costa, 40 per cent due to frost. Fresno, hurt some by frost. Kerman, very light, due to frost and bud drop. Kern, hit hard. Kings, cut to 50 per cent by frost April 15. Los Angeles, about 40 per cent, damage in various localities. San Fernando, fair in spite of frost April 16. Orange, good. Riverside, spotted, Hemet district will total good crop barring future troubles. San Benito, 60 to 80 per cent. San Bernardino, good. San Joaquin, some damage, not many grown. Santa Clara, averages very light, very spotted, better in higher parts than on floor of valley, southern end wiped out by frosts to and including April 18, and by brown rot before that time. Santa Cruz, average crop expected in spite of brown rot damage. Solano, short. Stanislaus, heavy setting. Tehama, 25 per cent. Tulare, 10 or 15 per cent, but few grown. Yolo, Winters thought crop wiped out, but now expect 50 per cent.

Apples.—Contra Costa, 100 per cent. Napa, very good. Sacramento, Astrachans 100 per cent. Santa Cruz, better prospects than for years at this season. Sonoma, fine prospects, though some varieties still in bloom, probably none hurt by frost.

Cherries.—Napa, normal, but not heavy. Placer, Knights 50 per cent, Tartarians, 60 to 80 per cent. Royal Annes 75 per cent. Black Oregons, Bings, and Lamberts 100 per cent. Sacramento, two sizes in

certain places, smaller ones still in jackets and will drop, unpollinated due to rain during blooming. San Benito, full crop promised. Santa Clara, rather light. Santa Cruz, fine condition. Solano, slight loss. Sonoma, about half a crop of first size have shed jackets, estimated Royal Annes 40 to 50 per cent loss by frost, blacks 30 to 40 per cent loss.

Peaches.—Butte, 20 to 25 per cent, account frost. Contra Costa, 80 to 100 per cent, no frost injury. Fresno, good prospects generally in spite of frost. Kerman, fair. Kern, 50 per cent. Kings, 75 per cent or worse, due to frost. Placer, Alexanders 75 per cent, Hales, Triumphs, Early Crawfords, Salways, Lovells, Hulls, Midsummers, and Levys 100 per cent. St. Johns 50 per cent. Elbertas 50 per cent where affected by curl leaf, 100 per cent elsewhere. Riverside, average crop. Hemet, good. Sacramento, shipping and canning varieties set above last year's full crop. San Bernardino, good. San Joaquin, good. Santa Clara, killed in southern part by frost. Shasta, 40 per cent. Stanislaus, heavy setting. Tehama, 100

Sugars and Standard 100 per cent. Sacramento, normal, though can't forecast prunes which still in jackets. San Benito, prunes bloomed well. Santa Clara, discouraging prospects, wiped out in southern end April 18 by frost, except half of the French prunes. Santa Cruz, fine condition. Shasta, if prunes now green and growing should all stick the trees could not hold them; frost April 14 and 15 did less damage on plowed orchards and less everywhere than if it had been preceded by warmer weather; loss 10 to 50 per cent. Solano, Grand Dukes and Diamonds damaged by frost. Sonoma, prunes still in jackets but prospects fine. Tulare, fair crop plums and fine prospects for prunes. Tehama, prunes full of good bloom.

Beans.—Kern, over 50 per cent increase in acreage. Madera, larger acreage. Marin, some being planted for market. Merced, acreage about same as last year. Monterey, acreage expected to increase 100 per cent, to 19,000 acres. Napa, increased acreage. Riverside, big acreage. Hemet, 400 to 500 acres teparies and bush limas signed up

age. Riverside, big planting. Sacramento, 3,500 acres. San Bernardino, over 2,000 acres and good prospects. San Joaquin, less than last year expected, perhaps 25,000 acres, some damage last week's frost. Santa Cruz, usual acreage. Shasta, crop normal, but never supplies local demand. Stanislaus, some frosted last week.

Tomatoes.—Merced, heavy planting, one company has 500 acres for Atwater Cannery. Riverside, Hemet, big acreage promised. Sacramento, 1,300 acres. San Diego, Escondido, large acreage for proposed new cannery. Sonoma, probably 200 per cent greater acreage than ever before, found advisable to increase by 5,000 acres, efforts of canneries to contract show plenty of cans.

Grain and Grain Hay.

Alameda, Pleasanton, hay good condition, last year's about gone, little at hand selling \$32 ton; Livermore brown, poor condition except on summer fallow; Tassajon fair; San Ramon and Altamont poor; Tracy getting brown. Contra Costa, unless showers within week hay crop will be less than last year; barley good on Delta, but retarded by cold weather; wheat acreage very limited, needs rain. Fresno, Kerman unirrigated practically failure, irrigated about half a crop; Imperial barley crop estimated 250,000 sacks against 400,000 last year; much being cut for hay which is normal crop except late sown which damaged by aphids. Kern, 50 to 100 per cent depending on rains from now on; wheat not suffering yet, one tract 2,000 acres looks as good as last year when it made 12,000 sacks; same acreage as last year. Tehachapi, crops look fine. Kings, hay 75 per cent normal. Los Angeles, San Fernando, grain looks better than anywhere north of Tehachapi. Madera, acreage larger than normal, 60 per cent crop, wintersown very poor, summer fallow will make fair crop without more rain, hay crop light. Marin, hay helped by rains since April 11, will be 30 per cent below normal, grain early planted heading out, but late planted was held back by cold, even to mid April, giving it time to stool out, rain April 21 insured fair crop; about 2,000 acres to be cut for hay. Merced, very poor unless rain in April, except on summer fallow which is good, practically no hay. Monterey, failure in southern part and light all over due to lack of April rain. Napa, never better color for the time of year, though not so forward as some years. Riverside, fair, mostly cut for hay. Beaumont and Banning, 75 per cent barley crop for grain. Hemet, San Jacinto and Perris, only 50 per cent, which may be increased due to rain April 16, which was almost too late. Sacramento, 100,000 acres hay and grain, normal crop, conditions very fair. San Benito, last year's hay nearly all sold, now \$29 ton, need rain for grain and hay; in the valley prospects are for 50

SHIPPING FRUIT PROSPECTS BRIGHT EXCEPT FOR LABOR.

The shipping fruits marketed this year will be 1,000 cars short of last year's total of 16,973 cars in the judgment of F. B. McKevitt, due principally to frost damage, and practically none at all to diseases or insects that have yet appeared. The Eastern market will take everything of good quality that we can send, and pay good prices. The refrigerator car shortage of last year has been remedied by the addition of 4,000 cars by the Southern Pacific; so movement of the crop is now only a question of motive power. There may be trouble in transportation due to movement of troops, munitions, and provisions; but the greatest danger now lies in not having labor enough to harvest and pack the fruit when it is ready. Something must be done quickly or a short crop would be better for us than a large crop. France and England have had to import labor and we must have cheap labor or our fruit will rot. It is believed by Mr. McKevitt that fully one-third of the cost of raising a fruit crop is for labor, and with the narrow margin on which fruit growers generally are operating, the very probable rise in labor costs will wipe out their chances of making a living.

per cent, severe frost April 15-16, but if half of peaches killed would still leave good crop, some orchards uninjured. Tulare, full crop except few low spots and exposed places.

Pears.—Contra Costa, 100 per cent unless heavy drop. Napa, very good condition. Placer, 75 to 100 per cent. Sacramento, biggest setting ever, 110 per cent. San Benito, full crop. Santa Cruz, fine condition. Shasta, good. Tehama, 100 per cent. Tulare, fine.

Plums and Prunes.—Butte, prunes 40 to 60 per cent, due to frost. Contra Costa, 50 per cent of Jap plums did not set, prunes in fine shape, cannot predict until May. Kings, damaged by frost. Napa, normal but not heavy. Placer, Clyman and Tragedy 100 per cent, Red June 50 per cent, Beauty 25 per cent, Formosa 50 per cent, Climax 50 to 90 per cent, Santa Rosa 50 per cent, Botan. 25 per cent, Burbank 50 to 100 per cent, Kelsey and Wickson 15 per cent, Gaviota 25 per cent, Diamond 100 per cent, Dukes 40 per cent, Giants 100 per cent, Hungarians 50 per cent,

for one firm alone. Sacramento, 2,000 acres more than ever before, totaling 22,000, mostly pinks, bayous, cranberries, and large whites, according to best locations for each. San Bernardino, extra acreage. San Joaquin, not yet planted, but all available acreage will be. Ripon, heavy planting, pinks, teparies, and Lady Washingtons. Manteca, heavy acreage, blackeyes and teparies, 17,000 acres expected in county. Shasta, considerable acreage, one man to plant 100 acres pinks. Stanislaus, largest acreage in history expected, mostly teparies, blackeyes, and red kidneys. Turlock, last year 3,000, this year estimated 12,000. Sonoma, bean acreage to be increased about 200 per cent, but seed is short. Tulare, considerable acreage, teparies popular.

Potatoes.—Alameda, large acreage will be planted. Contra Costa, spring crop small acreage, nine-tenths of Delta crop still to plant. Kings, 100 per cent increased acreage, frosted some. Madera, Chowchilla larger acreage. Marin, being increased 100 per cent, to about 1,200 acres. Monterey, heavy acre-

to 75 per cent hay crop. San Bernardino, 50 per cent crop barley hay. San Diego, three-quarter crop barley and oats. Mission Tia Juana San Pasqual, and Poway Valleys, suffering hay shortage. San Joaquin, wheat, barley, and rye 60 per cent normal condition, but 125 per cent normal acreage will bring crop up to normal; dry, but cool weather favorable; west side suffering most for rain; generally good on heavy soil; hay crop short, no volunteer. Turlock, report 6,000 acres will be cut for hay to be followed with beans. Ripon, fallowed grain good, west side poor. Manteca, fair generally, good on summer fallow, last season's crop about gone, price \$32 per ton. Santa Clara, southern part needs rain badly in order to mature either hay or grain. Shasta, two inches of rain about April 14, crop normal due to previous showers as well. Stanislaus, east side fair but needs rain, no hay except in irrigated sections; winter sown barley will scarcely make seed but summer fallow promises well. Large acreage in Waterford, Hickman, La Grange, and Montpelier districts. Sub-irrigated grain very backward, may not be cut in time to raise another crop. Denair, very poor. Sonoma, backward, but good color and the April 21 rain will help much. Tehama, barley looks good except late seeding, and with increased acreage promises 15 or 20 per cent greater crop around Los Molinos than last year; wild hay ahead of alfalfa owing to

cool weather. Tulare, short unless rain soon except summer fallow. Delano, some fields already lost, Earlimart fine.

Sorghums and Indian Corn.—Alameda, large acreage will be planted. Kern, 50 per cent increased acreage, everybody planting as much as they have water for, will be about 50 per cent increased acreage, seed corn 7 cents Bakersfield, may hold acreage down. Kings, large acreage. Madera, large acreage milo, feterita, etc., to be planted, total about 1,000 acres Egyptian in county. Merced, large acreage Egyptian. Napa, interplanting in orchards where interplanting had ceased. San Joaquin, 13,000 acres, Manteca, heavy acreage kafir and sorghums. Stanislaus, large acreage. Tulare, large acreage Egyptian.

Alfalfa.—Fresno, Kerman, acreage 4,000, first crop light due to cold spring. Imperial, first cutting proved half of normal, due to late cold weather. Los Angeles, Orange counties decidedly short crop. Sacramento 400 acres increase. San Diego, too short to cut. San Joaquin, full crop, but two weeks late. Ripon, first cutting in shocks. Manteca, less acreage than last year. Stanislaus, one crop short for season, first crop cut but short and not much in it; acreage much less than usual, three weeks late. Tehama, very late and first cutting will make only 50 to 85 per cent, crop of poor quality. Tulare, considerable new planting around Earlimart.

Pasture.—San Benito, 25 to 50 per cent in the hills. Madera, rain in fileree section in hills 30 miles from Madera helped feed. Marin, very short due to cold dry winter, necessitating reduction of dairy herds 15 to 20 per cent.

HOGS AND SUNFLOWER SEEDS.

Dr. W. E. Taylor, in charge of investigations for the Deere Implement Company, writes: My attempt to fatten hogs on sunflower seeds was not a success. The hogs did not relish the feed, regardless of how I mixed it with other feeds. It caused their bowels to be loose, but the most marked effect was on the kidneys, causing frequent and copious urination. Those that were forced to eat the sunflower seeds for a period of ten days, lost in weight and exhibited symptoms of stomach trouble.

Fine rain approximating an inch average along the eastern half of the Sacramento Valley fell about April 21, being lightest (about ½ inch) where it entered the valley in San Joaquin and Sacramento counties and increasing as it went north. The west side received less, Oroville having had 1¼ inches while Chico recorded only ¾ inch and Orland 1-3 inch. Coast counties north of the bay were well drenched, an inch being recorded at Santa Rosa, according to the United States Weather Bureau. This practically assures a reasonably good grain crop, etc. as it follows occasional preceding showers, one of which in mid April gave over a half inch from Colusa to Red Bluff.

Save Money Cultivating With a Bean TrackPULL SIX HORSE Tractor

For pulling a cultivating tool, the Bean TrackPULL Six-horse Tractor hasn't an equal. This little machine also excels at plowing, discing, harrowing, spreading and other farm, orchard or vineyard work.

THIS IS WHY

The Bean TrackPULL Six-Horse Tractor is superior because its weight is only 2875 lbs.; does not sink in or pack the softest soil. Efficiency: It is the Tracklaying type, traveling on its own track, giving long traction, and responds quickly when a turn is to be made. Power: It does the work all day long that six hard working horses can do working continually, and it never wants to loaf when the hot days come. Superior construction: It is equipped with Le Roi 4-cylinder vertical type, 4-cycle motor, Donaldson air clarifier, Bosch ignition, Famous Hyatt Roller Bearings and New Departure ball bearings throughout, Perfex radiator, water cooled with centrifugal pump and fan, combination splash and pump lubrication, and is so simple a boy can operate it.

Completely circling a lemon tree with a 6-ft. Double Disc.

Pulling 12-ft. Forkner Cultivator, making difficult turn. Distance between tree and fence, 12½ ft.

Write us for the name of nearest TrackPULL agent and other information.

Although we have just finished a big addition to our plant to supply the ever increasing demand of Bean Tractors, every indication points to a demand very much in excess of the possible production, and we urge you to get in your order early.

"A puff in time saves the vine."

They are sure death to grape mildew.

They kill red spider and mite on grape vines, on prune, almond, citrus trees, etc.

Destroy pests in truck garden and field.

Fastest and easiest-working machines on the market.

Throw perfect cloud—no lumps, no clogging.

Use less material—do more work.

For sale by all progressive dealers. Or, send us \$11.00 for vineyard size—\$13.50 for orchard size. We ship all charges paid. Try it a week. If not pleased, return at our expense, and we will refund your money.

We Fully Guarantee Every Machine.

Repelling Rabbits from Trees and Vines.

To the Editor: What spray can be used on young vines to keep rabbits from eating them?—E. L. N., Reedley. Ditto for young prune trees?—A. W. J., Saratoga.

Poison sprays are rather ineffective because the shoots soon grow out where they may be attacked. Arsenate of lead paste four pounds per 100 gallons of water, is most promising. Poisoned bait that rabbits like might get them.

Repellant applications will probably be more effective. One of the handiest of these is to kill a few rabbits, split their carcasses and rub them up the trunks. This is effective

for a month. One rabbit was enough for 10 acres of trees which G. B. Abbott of Tehama County treated that way; but he did not do it thoroughly enough to keep rabbits out of the orchard, which is your problem. Blood sprinkled around the out edges of the orchard is a sure remedy according to one of our subscribers; but it may also repel you. Perhaps dried blood fertilizer would work and benefit the land at the same time. Rancid grease mixed with whitewash is repellant and protects trees from sunburn too. Swabbing the grease on the trunks would repel the rabbits until the smell is gone.

Gooseberry Mildew.

B. Panten of Kazmierz, Posen, reports that a 1 per cent solution of 40 per cent formalin, thoroughly applied in the early spring and again before the period of blooming, effectively controlled American gooseberry mildew.

It is stated by J. V. Eyre and E. S. Salmon in Jour. Bd. Agr. that an ammonium sulphid solution containing 0.18 per cent of sulphur can be recommended for commercial use on an experimental scale for the purpose of protecting the fruit of

gooseberries against the mildew. Lime-sulphur wash should be employed for early sprayings until such time as its use would affect the marketing of the berries, when the ammonium sulphid solution should be substituted. It is stated that solutions of liver of sulphur at the strength usually considered as fungicidal are inefficient against the disease, while concentrations which are fungicidal cause such severe scorching of the gooseberry bushes as to preclude their use in this connection.

Fertilizer for Weak Fruit Trees.

[Written for Pacific Rural Press.]

The best method of applying nitrate of soda to orchards is to spread the dry crystals broadcast under the trees on moist ground, and harrow soon afterward, as indicated by experiments at Oregon Agricultural College. The fertilizer must be dissolved and put in reach of tree roots before it does any good.

Where old trees are weakened, as shown by thin foliage, little leaf, dieback, etc., six pounds nitrate of soda per bearing tree are recommended for the first year, and not over three pounds the next year on ac-

count of overstimulation of wood growth.

A Napa County orchardist has about 900 three-year prune trees, scattered among which are 25 which failed to show vigor this spring. If there is no crown gall or similar disease, about 1½ pounds nitrate of soda or a little over a pound of sulphate of ammonia may be applied in a broad shallow trench two or three feet from these trees and water used to dissolve and carry it down to the roots. This will probably enable the weak trees to catch up with the others by mid season.

Sudan Grass Among Almonds.

To the Editor: I have five-year almond trees on five acres of nearly level, rather heavy loam. Frost got all the almonds, so I want to sow sudan grass between the rows, keeping it six feet from the trees, which are 24 feet apart. The land is patched with morning glory, but is in good condition. Will the morning glory and shade of trees affect the sudan grass like corn? Will this make good horse feed? If any goes to seed will it be a pest? I have no irrigation. Will an ordinary grain drill do for seeding or should I broadcast it? When should it be sown?—T. C. G., Concord.

Sow with grain drill, stopping enough holes so the rows will be

about a foot apart. Cover about 1½ inches. Cultivate it to conserve moisture until you sow, any time in May, and cultivate after it comes up. Use at the rate of about six pounds per acre. It would take twice that much if broadcasted. No danger of its becoming a pest if you have pure seed. It makes fine horse feed. Morning glory is likely to affect it like corn. We do not know about the shade, but your trees won't prevent its growth. Your trees should be your first consideration. Plant only six or eight feet wide in the middles.

their trees do better as a result.

The young pear orchards on this place are located on bottom lands, where there is sufficient moisture without irrigation. Early in April, Superintendent Vandever had a disk cultivator breaking up a thin crust that had formed from recent rains. This was to be followed by a good, deep plowing before planting the centers to Mexican Red beans between April 20 and May 15.

A large acreage was to be planted

to milo the latter part of April on land that is to be set out to olives next year, the theory being that clean and frequent cultivation all season will leave the land in good condition for the trees. Milo is preferred by Mr. Vandever to kaffir corn, because the stalks as well as the heads can be utilized for feed, while those of kaffir are dryer and not liked by stock so well.

CABBAGE WORMS.

The common cabbage worm, the most destructive insect enemy of cabbage and related crops in the United States, begins its depredations as soon as the young plants are set out in the spring. Steps to combat it should be taken at an equally early date. These are pointed out in Farmers' Bulletin 766 of the United States Department of Agriculture, "The Common Cabbage Worm," by F. H. Chittenden.

Spraying with a solution of two pounds of powdered arsenate of lead, four pounds of arsenate of lead in the paste form, or one pound of Paris green to 50 gallons of water should be begun as soon as the plants are set out and should be repeated as often as examination of the plants shows it to be necessary. Sprays should be applied in a fine mist, since coarser applications tend to gather in drops on the leaves and run off.

ROTATION FOR SUGAR BEETS.

At least four or five years' and preferably six years' rotation of crops is recommended by the U. S. Department of Agriculture in Bulletin 772 as a means of controlling the sugar beet nematode, a pest which has been known to close a number of sugar beet factories in Europe, and which is already sufficiently prevalent in the United States to be a serious menace to the industry. Rotation crops recommended for California and Arizona are cow peas, soy beans, sweet clover, rye, millets, tomatoes, asparagus, lettuce, cantaloupe, strawberries, barley, corn, Lima beans and wheat.

WATER FOR VEGETABLES.

Three inches of water (about two gallons) on every square foot will wet the soil about one foot deep, according to the Agricultural Experiment Station at Pullman, Washington. By applying this rule to the following depths at which some of the common vegetables feed, a fair idea of the amount of water to apply may be arrived at: Corn, six feet; potatoes, four feet; peas, five feet; beans, three and a half feet; beets, three feet; and carrots, three and a half feet.

Healthy Vegetables

The U. S. Dept. of Agriculture recommends that you rid your seeds and soil of infection before planting, with the greatest known disinfectant—

FORMALDEHYDE
"The Farmer's Friend"

It prevents potato scab and black-leg that attacks beets and other vegetables. It guards against onion rot and onion smut and smudge, cucumber root rot. It prevents mould in celery, lettuce, parsnips and other covered seeds when applied to the beds before planting. One pint bottle of our Formaldehyde costs 35 cents. Big scientific book with full directions sent free upon request.

INTERCROPPING YOUNG ORCHARDS WITH BEANS AND MILO.

[Written for Pacific Rural Press.]

Besides the additional profits which arise from the growing of such summer crops as beans and milo in their young pear and olive orchards in San Joaquin county, the New England-California Corporation find that such summer crops keep their ground in fine cultivation before and after planting; and that

Raise More Corn in California.

[By E. J. Luke, Manager Sperry Mills, Stockton, Corn Day Demonstration, March 31.]

Gentlemen: This little demonstration is the result of about a three years' campaign on our part to get the farmers of California to raise more corn. Until three years ago the Sperry Flour Company was using 500 tons a month; 95 per cent of these 500 tons was brought in from the Middle Western States, at an additional cost of \$11 a ton for freight. This year we used about 700 tons right here in Stockton. We want to buy all that corn right here if we can. We know that corn can be raised in California. If the Eastern farmer can raise corn, pay \$11 a ton freight and make money, the California farmer, with only about a dollar a ton freight, can raise corn and make it pay.

A question has come up whether it is possible to raise too much corn in California. The Sperry Flour Company, using 1,000 tons a month in its entire system, is only a small unit in the State of California in the use of corn.

GOOD SUMMER FALLOW VS. ANNUAL BARLEY CROP.

[Written for Pacific Rural Press.]

"This country needs summer fallow for grain, and it ought to be real summer fallow," says M. Barnett of central San Diego County. Mr. Barnett got a barley crop as tall as he is, while across the fence barley sowed the same day headed out a foot high. Mr. Barnett's 40 acres had been plowed a foot deep in the winter of 1913-14 and worked down all summer. When weeds started in the spring the ground was cycloned twice to prevent their use of the stored-up moisture. In December, 1914, it was broadcasted and harrowed, the ground being already loose on top from cultivation, but well compacted underneath. This barley was pastured in the fall of 1915 and the ground disked in January, 1916. The volunteer crop produced a ton of hay per acre. Across the fence, the land had been rented and cropped every year, yielding not much of a crop for several years.

FARM ACCOUNTING.

Keep a record of all farm expenses and receipts.

Keep a record of all the man and horse labor.

Have a separate heading for all finished products.

Cross enter all farm products that

New Jersey, with an area of 5,260,000 acres, last year raised 22,550,000 bushels of corn. California, with an acreage of 100,000,000, raised 2,160,000 bushels.

While a great deal of Eastern corn is shipped in here in bulk, it is nothing compared to the manufactured article brought in here. If you will give us the corn, it will enable us to meet the competition of the Eastern manufacturer; and the State of California as a whole is going to be benefited. Again, you not only have the State of California for your market, but Washington and Oregon to ship corn into, because they buy all their corn from the East.

We paid out \$140,000 for corn from December 1, 1915, to April 1, 1917, and this \$140,000 stayed right around Stockton. Now we figure that the nearer home we keep a dollar the quicker we will get it back again.

are consumed. For instance, silage is a receipt in the corn column and an expense in the cattle division.

Charge the labor used to produce each product at the end of the year to the various enterprises.

The difference between the receipts and the expense, plus or minus the difference between the inventories at the beginning and the end of the year will be the total gain or loss.

ANALYZING FARM BUSINESS.

The office of Farm Management of the Department of Agriculture has provided, in Farmers' Bulletin 661, blanks for use in analyzing a farm business in such a way that the farmer can readily ascertain the various sources from which he derives his income, the ways in which he spends his money, the total income from the farm, and the amount which should be charged off for interest on his investment. About one-third of the farmers who have analyzed their business in this way are now keeping books, it is said.

Oil of the soy bean is a palatable food widely eaten by the Chinese. This vegetable oil also is used in making paints, varnishes, soaps, rubber substitutes, linoleum, waterproof goods, lubricants, and printing ink.

Sweet Clover to Kill Water Grass

To the Editor: The water grass problem is a serious one in the rice fields. If by any chance a hardy crop like melilotus alba (white sweet clover) should solve it, it would be worth a great deal to the rice farmers. Our idea is to grow the sweet clover, and sprout the water grass along with it, cutting frequently and, if possible, just before the water grass seeds. If that will work, it will eventually put an end to the pest, when its seeds have all sprouted. From what we can learn of sweet clover, it will grow on land that is too wet for alfalfa, and endure extremes of temperature, dryness and other unfavorable conditions.

We have found this clover growing here in wettest places, as well as dry. Have pulled it up within the last few days and found long carrot roots, with more or less fibrous roots also, and all covered with nodules of nitrogen. In fact, the roots are bulky and bound to loosen up the soil; and I believe will prove of great value in renovating land that has been rice and flooded for several years.

The idea of planting sweet clover in the rice fields came from C. F. Penniwell of the Westroac Co. of your city, who has done a lot of work experimenting with legumes for all kinds of soil betterment; and, in my opinion, is entitled to a lot of credit for encouraging the cover crop method of fertilizing.

Penryn.

H. E. Butler.

We are facing a world wide food shortage. For the sake of the hungry world as well as for the good of your bank account you ought to make every foot of your land produce its utmost. You can't possibly do this without fertilizing. Germany's crop failures for the past two years have been largely due to her inability to secure proper fertilizer materials.

GOLD BEAR FERTILIZERS

Are made from Animal products that contain the elements necessary to meet California soil conditions and crop requirements.

Sudan Grass for Quick, Heavy Hay Crop

[Written for Pacific Rural Press.]

Hay seems likely to be scarce and high priced this season. Phenomenal alfalfa prices the past winter and spring have not prevented plowing out large acreages of this crop to plant beans, potatoes, etc. One of the largest seed houses reports selling 25 per cent less alfalfa seed in California than last year. The high prices of grain will discourage the making of grain hay where grain seems likely to mature. Wild grasses have been pastured to the limit and not much will be left to dry for summer forage. Yet we have reports of an increased number of hay-eaters in the State.

To him who would get a hay crop in June by planting early in May, or pasture two or three weeks earlier, Sudan grass offers most inviting prospects if planted after frost is past.

With hot weather and irrigation every two weeks, it makes mature hay in forty to fifty days, according to D. C. Aepli of the Yuma Experiment Station. He also says it can be pastured any time after three weeks from seeding.

Sudan grass was brought to the United States because of its drouth resistance. Whether you have irrigation or not, and whatever soil you have, but will yield almost as much per year as well established alfalfa; and more than newly planted alfalfa. Being harvested in fewer cuttings, it requires less labor.

The seed this year is scarce and high priced, being quoted at 35 to 50 cents per pound. About six pounds per acre are required to drill in rows 18 to 24 inches apart. If broadcasted, 16 to 24 pounds of seed and much more water are needed. Cultivation of drilled rows saves water. Drill three-quarters to two inches deep, according to soil and moisture.

Feeding Value.

Sudan hay, cut in full bloom, makes the best quality of hay, according to the United States Department of Agriculture. Such hay was analyzed by the Oregon Agricultural College. It contained 3.51 per cent moisture, 5.64 per cent ash or mineral matter, 1.27 per cent fat, 4.66 per cent protein, 49.3 per cent carbohydrates and 35.62 per cent fiber. It is very leafy and the leaves stay well with the stalks.

Many people cut Sudan sooner and get a finer textured hay that sells better but is not eaten better, and is more laxative. It does not bloat stock, but where its growth has been checked by frost or drouth the new green growth should not be pastured until it is known definitely that it does not contain prussic acid. If it does, this poison becomes harmless when the grass is made into hay.

Some Who Have Tried Sudan.

On September 10, a year or two since, G. W. Lane of Santa Clara county sent us a magnificent sample of Sudan grass. Part of it was over six feet tall and had gone to seed after a full season's growth. The rest was fine green hay about 30 inches tall, the second cutting that season without irrigation, after planting in April. This field had

been in hay without fertilization for several years previous. Said Mr. Lane: "All the stock are fond of it, perhaps on account of its sweetness. It does not bloat."

The Alkire ranch of Phoenix, Ariz., wrote us their experience a couple of years ago. They planted June 1 on old alfalfa land, four seeds per hill, hills six inches apart, and rows four feet apart. They cut some of it for seed August 25, doing this by hand to eliminate sports and weeds. "The yield was 1,600 pounds of threshed seed and eight tons of hay per acre," wrote H. A. Huntington. "The plants had very good leaves and stems. Both horses and cattle ate it up clean." This yield of seed is a little above the average for California.

G. P. Marcus of Monterey county planted three-quarters of an acre with three pounds on May 12. Late in August he took to town a stool containing 103 stalks, the longest of which measured 7 feet 2 inches.

George McNair of Butte county cut Sudan grass 8 feet 11 inches tall on August 1 from seed planted May 9.

A southwestern farmer reported turning hogs on Sudan grass when it was a foot high, and pasturing them on it all summer. Caution may well be exercised in pasturing, however, for the ground is soft, due to annual seeding, and the plants do not form a sod.

J. H. Trayner of Butte county pastured thirty-three acres of Sudan heavily with dairy cows and cut forty acres for hay. The first cutting yielded two and a half tons per acre just as it was going into blossom. After the hay was cut the cows were pastured on this also. He made a balanced feed of roughage by combining the high-carbohydrate Sudan with high-protein alfalfa.

W. E. Woodward of San Diego county drilled 25 pounds on six acres in rows three feet apart in May. He pastured the bottom land four times and the hillsides twice, beginning July 15. He thinks twice as much seed and twice as many rows would use the land more economically. Both he and Mr. Trayner got better results in milk from Sudan than from alfalfa.

In southern Oregon and the Willamette Valley the O. A. C. recommends planting May 1 to 20 after the ground is warmed up.

In Nevada, while Sudan requires more heat than elevations over 5,000 feet generally afford, it may prove well as a supplementary feed for live stock additional to the splendid alfalfa grown in this State, provided summer frosts are not too frequent.

Sudan grass seed looks like Johnson grass, and doubtful samples should be sent to the university as soon as possible for tests as to purity and germination. Pure Sudan has no underground root stocks and being cut for hay does not reseed itself, so it cannot become a weed pest.

A cool shade for cows in the summer will help keep up the milk flow.

"The Schmeiser Way Makes the Farm Pay"

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat at over \$2 per bu. offers great profits to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops.

You can get a Homestead of 160 acres FREE

and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of Oats, Barley and Flax.

Mixed Farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

There is now an extra demand for farm laborers to replace the many young men who have volunteered for service in war. The government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or

Agricultural Jottings

The first blackberries of the season were on the Los Angeles market the past week and they sold at \$5 per 30-basket crate.

The Annual Strawberry Day Festival at Gardena will be held May 4-5 and a most interesting program has been arranged.

Don't forget the Ninth Annual Raisin Day Festival at Fresno, April 29-30. There will be a big patriotic parade, band concerts, gorgeous floats, and outdoor sports.

County Horticultural Commissioner Chas. F. Collins of Fresno county has sent warning to grape growers to take precautions to prevent mildew and other diseases which affect grapes.

E. Scrivani, who shipped the first strawberries from the Salinas Valley this season, received word from San Francisco that his berries brought \$23 a chest. The average price per chest in any ordinary season is \$5.

Valuable information to lettuce raisers can be obtained from a bulletin on "Lettuce-Growing in California," written by Stanley S. Rogers, assistant professor of clericulture in the University of California, just issued by the University.

Sugar refinery refuse is being experimented with in England with a view to producing a new fuel for automobiles and tractors. It is said to be superior in some respects to gasoline and may be taken up by our many sugar factories in our State.

Figures taken from the report of the State Tax Commission show a striking lack of uniformity among the counties in the proportions borne by assessed values to the true values of non-operative property. Humboldt county is said to have the lowest valuation ratio and Riverside the highest.

During this season up to April 1 Tom Henry, Horticultural Inspector for San Luis Obispo county, inspected and passed upon 126,774 almond trees, 9,007 prune trees, and other fruit and nut trees to the number of 148,037; also berries, grapes, vegetables, and ornamentals to the number of 8,337.

Legislation to empower the Council of National Defense to supervise distribution of food, and if necessary fix maximum and minimum prices, has been framed as one of the results of a conference between the great Chicago meat packers and Secretary Houston of the Department of Agriculture.

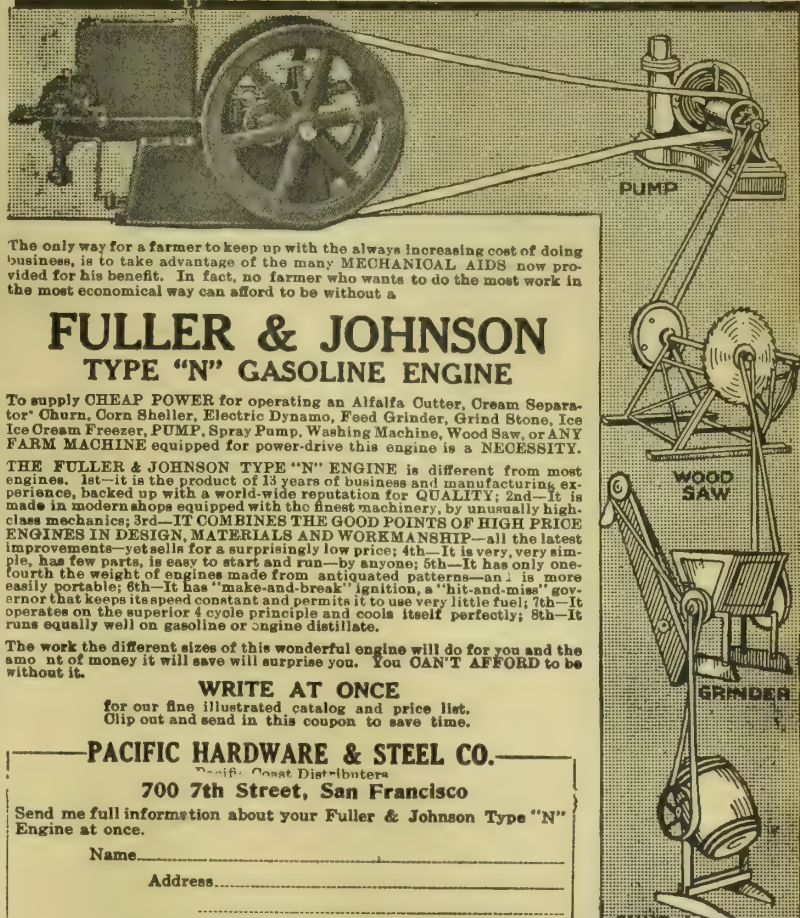

The approval of a plan to establish a 300-acre dry farming experimental bureau adjoining the University farm at Davis, given recently by the Board of Regents of the University of California, marks the initial move of the institution's control body to increase the food production of the State.

The Forest Service plans to spend \$6,000 this summer in clearing the grounds in the national forests of California for the purpose of establishing camping places. The improvements contemplated include suitable sanitation equipment and signs along the highways calling the attention of travelers to the camps.

To check the reign of terrorism that has prevailed at times in our hop-growing districts and other rural sections of California, a bill has been favorably reported to the House Judiciary Committee making the teaching of unlawful methods of terrorism as a means of accomplishing industrial or political reform a felony.

County Horticultural Commissioner Fred P. Roullard of Fresno and R. L. Nougaret, government entomologist, will endeavor to obtain a new type of lady beetle which feeds on the citrus fruit mealy bug, with the view of seeing if it will destroy the mealy bug which works on the grapes in the Fresno section.

LET THIS ENGINE REDUCE YOUR HIGH COST OF LABOR

The only way for a farmer to keep up with the always increasing cost of doing business, is to take advantage of the many MECHANICAL AIDS now provided for his benefit. In fact, no farmer who wants to do the most work in the most economical way can afford to be without a

FULLER & JOHNSON TYPE "N" GASOLINE ENGINE

To supply CHEAP POWER for operating an Alfalfa Cutter, Cream Separator, Churn, Corn Sheller, Electric Dynamo, Feed Grinder, Grind Stone, Ice Cream Freezer, PUMP, Spray Pump, Washing Machine, Wood Saw, or ANY FARM MACHINE equipped for power-drive this engine is a NECESSITY.

THE FULLER & JOHNSON TYPE "N" ENGINE is different from most engines. 1st—it is the product of 13 years of business and manufacturing experience, backed up with a world-wide reputation for QUALITY; 2nd—it is made in modern shops equipped with the finest machinery, by unusually high-class mechanics; 3rd—IT COMBINES THE GOOD POINTS OF HIGH PRICE ENGINES IN DESIGN, MATERIALS AND WORKMANSHIP—all the latest improvements—yet sells for a surprisingly low price; 4th—it is very, very simple, has few parts, is easy to start and run—by anyone; 5th—it has only one-fourth the weight of engines made from antiquated patterns—and is more easily portable; 6th—it has "make-and-break" ignition, a "hit-and-miss" governor that keeps its speed constant and permits it to use very little fuel; 7th—it operates on the superior 4 cycle principle and cools itself perfectly; 8th—it runs equally well on gasoline or engine distillate.

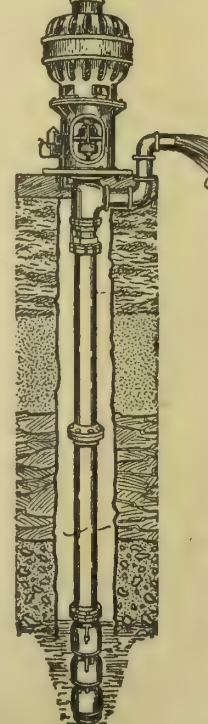

The work the different sizes of this wonderful engine will do for you and the amount of money it will save will surprise you. You CAN'T AFFORD to be without it.

"World's Work" Favors California Plan

The Eastern magazine, *World's Work*, which has achieved wide popularity for its outspoken support of progressive and promising achievements and plans for the development of various phases of American industry, finds a plan much to its liking in the land settlement proposition now being discussed in California. It speaks appreciatively of the "readable, informing and constructive report of the Commission on Land Colonization and Rural Credits of the State of California," and continues its comments, in part, as follows:

"This report is the fruit of a year's investigations, in which the Commission was aided in the taking of testimony and the analysis of facts by the Commonwealth Club of California and by the University of California. The report is a detailed picture of the business and social sides of rural life, an analysis of the causes of its failure, and a statement of the remedy. It points out that the Federal Farm Loan Act does not fully meet the situation because its benefits are 'restricted to farmers who can give first mortgage security on land worth double the amount of the loan,' and adds that 'in order to enable tenant farmers to become farm owners, or in order to give adequate assistance to colonists of small capital, a separate credit system based on some measure on the character of the borrower must be provided.'"

The Commission found that the commonest cause of failure of settlers was inadequate capital: "We have not found a single settler who, bringing with him only the limited capital accepted by state systems in other countries, has been able to pay for his land in the time agreed upon in his contract."

What Is the Remedy?—The Commission finds it to be in the adaptation of a system of state-aided or state-guided purchase, the essential elements of which are to be found in all the systems worked out by foreign countries.

Small Initial Payments.—The first of these essentials is a provision for enabling farmers to enter into possession of land with only a nominal payment, thus leaving the greater part of their capital available to pay for improvements and equipment.

Organized Construction of Farm Improvements.—The second is the creation of an organization, either state or private, to make the necessary improvements, such as houses, stables, etc., leveling and ditching irrigated land, and providing practical superintendence over the farming operations of beginners to prevent costly delays and mistakes.

Long-Time Payments for Land and Improvements.—The third is making the period of payments long enough to enable the money to be earned out of the soil, and having the payments amortized; that is, in small amounts paid annually or semi-annually rather than in a lump sum; also securing for the settler, usually through the use of the state's credit, loans of money needed for improvements at low rates of interest.

Practical Advice and Supervision

for Beginners.—The fourth is employment of capable business men fully informed regarding prices of farm equipment and farming operations in the locality, to give advice to inexperienced beginners or farmers from other sections of the country who do not know what crops to plant or when or how they should be cultivated.

European Experience.—*World's Work* then gives an abstract of the data given in the report concerning the success of such land settlement movements in European countries, and continues:

"At this point, if not before, the reader may be expected to object that 'American farmers are different; they are too independent and too individualistic to be profited that way.' But the fact is that one of the most extensive and most successful of these systems is in operation in Australia, which is more nearly like the United States in government and people than any other country save Canada.

"Between 1901 and 1914 the six Australian states purchased and subdivided 3,056,957 acres, for which \$55,243,125 were paid, or about \$18 an acre. In all these states provisions were made to assist settlers to build homes and effect improvements needed to bring the land fully and promptly under cultivation. In the five-year period from 1909 to 1914, these six states lent the farmers, to make improvements and buy equipment, \$68,029,500. This has been done without any cost to the general taxpayer, as the interest paid by the farmers was greater than the interest paid by the state; and the farmers have met both payments of principal and interest, so that there has been an accumulated profit of \$1,233,370.

"The whole of the California Commission's report is fascinating reading. Some of it concerns only California, because conditions there are extreme; but most of it applies equally to New England, the South, and the Mississippi Valley. And it contains much suggestive comment on the broad subject of land in its relation to the public welfare—besides containing much practical information for any man who is thinking of buying his first farm or of selling his old farm to buy a new one. It throws a bright light on some causes of the high cost of living, on the political disquiet of the farming states, and on the state of agricultural preparedness for war in this country. The war in Europe has now got to a point where it is largely a question of the side that has the biggest bread basket. We should confront the same situation in any prolonged war."

The Proposition Before the Legislature.—The proposition thus outlined and approved by *World's Work* is not now pending in this state. The bill now before the California legislature provides merely for a practical trial on a limited acreage, under the auspices of the University of California, which will demonstrate, without ultimate cost to the state, that capable, trained young farmers can be put upon land and can come to ownership of it, if they are fairly financed and assisted

to do good farming. It is a piece of practical field work in agricultural education to demonstrate that such education is worth having if it has a chance to come through to results. Whether such a policy of land set-

tlement on a large scale shall be undertaken by the state is not now pending, and the answer to that question may await the results of the demonstration which is now proposed.

Iceberg, especially adapted to maturing during hot weather; the Hansen, a desirable variety for local market; and the California Cream Butter, with outer leaves slightly spotted with inconspicuous brown spots, this variety having a rich, creamy taste.

ROOTS AS DEEP AS TREES ARE HIGH.

[Review in E. S. R. of Utah Bulletin by A. B. Ballantyne.]

This reports a study of a number of root systems of fruit trees removed from an orchard damaged by seepage conditions in the soil.

An examination of the root systems indicate that fruit trees may ordinarily be expected to send their roots deeply into the ground if the water supply is not too plentiful, especially near the surface, and the ground water level is not too high. The natural depth of fruit roots as indicated in this study is probably near the height of the tree. The method and amount of watering will alter the general shape of the root system and make it deep or shallow.

Critics' and Cuddlers' Corner

Willing to Pay for His Laughing.

To the Editor: Allow me to thank you from the bottom of my heart for your sense of humor. Perhaps it will surprise you, and perhaps it will not, to learn that there is a subscriber of the Rural Press who reads it, not merely, but chiefly to have a good laugh. Some of your answers to inquirers make me roar. That is why I read all your editorials even when the caption warns me that it is going to treat of some subject that does not interest me at all. You see, most technical journals are so lugubriously serious! What a relief it is to find someone who can be witty and sarcastic without ceasing to be serious. I also would like to express my appreciation of the way in which you treat all questions scientifically, and yet with so much bonhomie, without pedantry, without superciliousness.

Doubts Our Economics.

To the Editor: The young man who took my subscription this spring told me that it was the editorial policy of your paper to concern itself as much with the economic welfare of the farmers as it was to teach them how to grow their crops. Your editorial in the issue of April 14, giving your non-committal attitude upon the war, prompts me to ask if you are equally indifferent as to the economic welfare of the farmer who makes your existence possible? By economics I by no means mean politics. The question of single tax concerns the farmer economically. A State produce exchange concerns him economically. Where do you stand in these matters? I am anxious to know if your representative was correctly informed.

SUBSCRIBER.

Bishop, Inyo county.

Cream for the Kaiser.

To the Editor: It was the Kaiser's ambition to go down in history as the great peace lord. If ever a ruler had the welfare of his people at heart, it is this same Kaiser—a poet by nature. He set an example to his people by his clean, moral and frugal life, in the midst of all court splendor. He was as strict with himself and his immediate family as with state affairs. Such a man cannot be a "tyrant" or "demon." Such a lover of nature as you undoubtedly are must be a lover of the truth; and the above is it.

BEST LETTUCE VARIETIES.

At the University Farm vegetable garden, 80 different varieties of lettuce were grown during the last season, and most of them did well. The

four varieties, however, now most in favor in California are the Los Angeles or New York Market, which is best adapted for long-distance shipments and which withstands cold weather injury, but is not adapted to maturing during hot weather; the

GET IN YOUR ORDERS EARLY.

Our readers may find labor more than usually scarce this year. Other jobs are open for farm laborers that will attract them by the higher wages offered. Use of tractors, engines, electricity, auto trucks, and labor-saving machinery may be necessary to save the big crops we hope to raise. The demand for such will be heavy at the last minute, when deliveries may be impossible in time to save the crops.

GOODRICH BLACK SAFETY TREAD TIRES Underwritten by GOODRICH Good Faith

The Fair Treatment Guarantee—the pledged good faith of The B. F. Goodrich Rubber Company—takes the slightest shadow of a risk off Goodrich Black Safety Tread Tires.

You must get full value service from a Goodrich tire, or Goodrich wants it back forthwith.

Then Goodrich FAIR TREATMENT steps up and squares the debt of that tire—squares it gladly and generously with a liberal adjustment, bound to satisfy you.

For Goodrich accepts as the Company's debt of honor an obligation of tire service, worthy of the best fabric tire made.

There are no conditions, no catch words to Goodrich's world wide invitation:

*"Send back to Goodrich
ANY Goodrich tire you
believe owes you anything."*

"Best in the Long Run"

General Agricultural Review

Field Crops.

The 1916 bean crop totaled over \$20,000,000.

Men to harvest crops is the greatest need of the California farmer.

Throughout the entire State bean dealers forecast a doubling of the bean acreage.

A potash deposit has been discovered in sufficient quantities in Agua Caliente district to make marketing profitable.

C. H. Pratt, superintendent of the Biggs rice mill, stated recently that the Dodge people had just sold their rice crop for \$3.50 per cental.

W. W. Harris of Esparto has completed his cotton planting and is watching what nature will do. He planted long staple Egyptian cotton seed.

India's 1916-17 cotton crop will exceed that for 1915-16 by 19 per cent in area and 22 per cent in outturn, according to the final official estimate for the season.

The condition of winter wheat in California on April 1 was 84.2 per cent of normal. On that date wheat was quoted here at 159.2 cents against 86.6 cents in 1916 on same date.

Hops in the Russian river district have decreased in production the past year about 1,000 bales, and as many acres have been plowed out to make way for orchards and alfalfa.

Lindley Bros. have a 250-acre field of field peas in bloom north of Ripon. A shelling plant is being erected there and the peas will be hauled by truck to the Oakdale cannery.

The sugar beet growers of Orange county are feeling better. They are solving their troubles by importing white labor from Los Angeles and now have most of their beets thinned.

Palo Verde Valley, Riverside county, has acreage planted as follows: Cotton, 12,000 acres; alfalfa, 5,000 acres; grain, 6,000 acres; beans, 1,000 acres; rice, 250 acres (experimental).

It is announced from El Centro that 10,000 cotton pickers will be required to pick the big cotton crop that is now being planted on 130,000 acres. Hundreds of Mexicans are arriving to work in the cotton fields.

The better grades of Japanese rice grown in California constitute the best table rice produced in the United States, according to Joseph Stevens, president of the Pacific Rice Growers' Association.

A year ago the price for corn in the Stockton market was \$1.75 the hundred weight and last week it was quoted at \$3.10 to \$3.25 a cental, according to quality. Sperry's mills bought a big lot at the higher figure.

A few string beans were on the Los Angeles market the past week from the Coachella Valley and they sold at 25 cents per pound. A few summer squash were also from the same valley. They sold at \$1.75 to \$2.00 per crate of four baskets.

The average condition of winter wheat in the United States on April 1 was 63.4 per cent of a normal crop. The Bureau of Crop Estimates, United States Department of Agriculture, forecasts a production of about 430,000,000 bushels, compared with 481,744,000 bushels in 1916.

If weather conditions continue good in Imperial Valley there will be a big crop of canteloupes harvested by the end of May. Though the plants are all healthy and the stand practically perfect, the State Horticultural Department has supplied some lady birds to guard against aphids.

At a conference of canners and jobbers of canned products held in Chicago last week at the request of Secretary of Agriculture Houston and Secretary Redfield it was decided that no more baked beans, hominy, kraut, oils, tobacco, molasses or lard is to be canned in the United States during war time.

At a meeting of the Beet Growers' Association last week held at Long Beach, it was decided to plow up their young beets and plant the ground to vegetables and some other crops that required less labor. It is said that hundreds of Mexicans have left, and that it is impossible to get labor to thin beets.

Deciduous Fruits and Nuts.

Experimentation in Kings county with wild Chinese peach root shows a nine-inch growth already this spring.

Buyers in Stanislaus county are offering \$45 a ton for Tuscan and Phillips and \$30 for Levi and orange clings.

The prune crop throughout the State seems to be in excellent condition, and plums promise a heavy yield, as do peaches.

A more careful survey of the damage done by the recent frosts indicates that the first reports regarding Yolo county were exaggerated.

O. E. Bremner, Sonoma County Horticultural Commissioner, says

that April 14 is about the limit this year for pear and apple scab spraying.

At the annual meeting of the Oakdale Almond Exchange held recently all the members reported a

normal crop this year, and good prices are expected.

The apricot crop will be light because of rain during the blossoming period, according to a statement made by State Horticultural Commissioner G. H. Hecke recently.

There were very good prospects on apricots around San Jose—about 50 per cent in Santa Clara Valley proper. The higher lands which are out of the frost belt look very good, but the floor of the valley is pretty well burned by frost.

San Jose prunes have had an excellent blossom in all sections of the valley and the outlook is very favorable at this time. It is reported that there has been probably 11,000 to 12,000 tons sold to packers who are outside of the association, at prices ranging from 6 to 6½ cents basis.

O. W. Harris and Isaac Ford of Oak Glen say the apple crop has escaped damage by frost this year and the outlook is good for a big yield. Cherries around Oak Glen, however, were caught by the recent cold snap and the crop will not be much over half. Yucapia orchards escaped, they being much lower.

A recent financial statement issued by the Banning Almond Growers' Association shows this concern owns property valued at upwards of \$9,000. During the year their receipts were \$11,420.48 and disbursements \$11,326.06. Improvements amounting to about \$5,000 have been made during the year.

We are sorry to announce the death of J. B. Wraugham, which occurred on April 19. He was one of the original incorporators of the California Almond Growers' Exchange in 1910, representing the Fair Oaks and Orangevale Almond Growers' Association, and on January 10, 1913, was elected secretary of the Exchange, in which capacity he served until his death.

"Neighbors besieged me to join the association just as soon as I got home. I have only 4½ acres of prunes and didn't suppose you cared anything about that," said a lady from Calla who recently came to the California Prune and Apricot Growers' office and signed up when she was told that the more such people as she and her neighbors there were in the State, the better assurance they would have of getting all their crops sold for.

Citrus and Semi-Tropical.

A few loquats continue to come on the Los Angeles market from Orange county and they are selling at 6 to 12 cents per pound.

The new cannery at Riverside is assured. Sufficient capital has been guaranteed and the cannery is expected to be in operation in sixty days.

Reports from Riverside say that about fifty per cent of the navel crop has been marketed and prices received have been much better than a year ago.

Over a million boxes of oranges were produced in the province of Catania, Italy, in the season closing in March, 1917. This is 30 per cent less than the previous crop.

According to a statement from the Valencia district near Porterville the late crop this season promises to be very good. The fruit is more than average in volume and promises to be very high in quality.

It is reported that Secretary McAdoo has recommended that the duty on fruits and nuts be increased 10 per cent, but in the citrus fruits schedule the increase is expected to be more than 10 per cent.

According to advanced information obtained, the estimated yield of olives for all Italy for the year 1916 is 1,150,047 short tons, as compared with 1,125,411 tons in 1915, and a seven-year average of 1,163,712 tons.

Miscellaneous.

The Berkeley Federal Farm Loan Bank expects to make loans this April.

Agitation is on foot for the building of a bridge across the Stanislaus river at the Burneyville ferry.

Yakima Valley (Wash.) shippers are starting a movement to not wrap apples the coming season on account of the high price of paper.

Labor troubles are being experienced on the Lindsay-Strathmore irrigation project. Agitators are demanding \$3 for an eight-hour day.

For the grazing season of 1917 the National Forests in California are authorized to graze an equivalent of 327,315 head of cattle under paid permit.

The budget appropriation bills passed by the State Legislature included an appropriation of \$49,720 for the support of the State Market Commission.

The fish and game law passed by the last Nevada Legislature, that deputy game wardens must be appointed by the State game warden, has been repealed.

The State Hospital Farm at Napa carries 510 head of hogs (20 of them pure bred); 248 head of cattle, three pure bred bulls, five cows and four heifers.

The total bonded indebtedness of the State, county and city governments in California is \$253,000,000, according to official figures, or \$84.33 1-3 per capita.

It is said that 700 men are at work completing the potash plants of the American Trona Corporation and the Solvey Process Company at Searles Lake in San Bernardino county.

In order to preserve the pine forests of California, gooseberry bushes and raspberry vines grown east of the Mississippi river should not be admitted to the State. State quarantine has been established.

State Commissioner of Horticulture advocates the importation of 20,000 to 25,000 Filipinos to harvest the crops of California. This he urges as a war measure only, and in view of the acute shortage of agricultural labor.

Rabbit drives were carried out at various points in the San Joaquin Valley recently. Free barbecue luncheons, ammunition at cost, and a cordial welcome to everybody called out a large attendance. Thousands of these pestiferous animals were killed.

K HEAVY DUTY CULTIVATOR No. 3 K

KILLEFER
QUALITY

KILLEFER
EFFICIENCY

This latest model of Tractor Cultivator was built to meet the demand of owners of the smaller size Orchard Tractors.

Built on the lines of our well-known and popular Monarch Cultivator with levers and rear wheel eliminated, but provided with hand wheel screw lift, making it a perfect one man cultivator.

The material used in this cultivator is of the same high grade as used in the make of all of the Killefer implements.

The great demand for this cultivator is keeping our factory running to full capacity to meet the demand.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

DYNAMITE AND STUMP-PULLERS CO-OPERATE.

[From address by Carl D. Livingston, University of Wisconsin, at Southern Land Clearing Conference, New Orleans.]

An organized effort directed along engineering lines will greatly promote modern land clearing methods and demonstrate them to the people you care to reach. A year and a half ago a new branch was organized in the department of Agricultural Engineering at the University of Wisconsin, the sole purpose of which was to deal with the problems connected with clearing the land. Previously there was no exclusive agency in the Lake States where land clearing data could be filed. When an inexperienced settler came into the country he had to begin, not with the knowledge of those who had been before him, but at the beginning.

Our largest single effort has been the two Land Clearing Specials which we operated over two railroads, during the spring and fall of 1916. The Specials of eight cars each carried a crew of 18 men, home-made equipment, hand and horse pullers, dynamite, and stump pullers. Our purpose was to demonstrate just what our equipment would do for the average man who had stumps to clear. We tried to show good practice for the little fellow as well as for the well-established farmer. Twenty thousand actual owners of stump farms saw the 30 demonstrations held in 16 cut-over counties. We stayed one or two days in each place and actually did the work of stump pulling, blasting and piling—sometimes burning.

The banks are now co-operating in the matter of loaning money to farmers which will enable them to clear their land more rapidly. Local improvement organizations and state advancement associations co-operate in movements which will cause many extra acres to be cleared. The Advancement Association has instituted a propaganda for the collective purchase of dynamite and stumping equipment. As a result, there will be placed many tons of dynamite where previously only cases of explosives had been used.

Land has always been cleared slowly, but we were able to show that the one-man pullers accom-

plished the work of many men who had only their unaided backs to use. Modern horse-pullers are quicker than the man-power machine. When equipped with modern takeups, the speed of the pullers is doubled. Power pulleys mean increased power, so that larger stumps can be pulled with the same weight equipment. Root hooks greatly add to the speed of stumping. Horse-power pullers have demountable trucks which make the whole equipment easy to move from place to place.

Dynamite is necessary in the majority of clearing problems, either alone or in combination with pullers. We showed conclusively that 20 per cent or 30 per cent dynamite did the same work, stick for stick, as the higher grades on the medium and heavier soils, at a saving of two to five cents a pound. By the combination method we found that with our lateral and semi-lateral rooted stumps, we could use a combination of pulling and splitting and thereby lessen the amount of dynamite required.

There is no royal road to cleared acres—it will always require work to clear land, but by the use of dynamite and modern equipment, the drudgery is passed up to machines and explosives. The accessories save heavy work. Pilers lift the stumps where heretofore they caused much grief before they were in condition to be burned. Labor-saving tools make the proper placing of explosives an easy matter. Electrical firing is safer, quicker, leaves better results and should cost no more under normal conditions.

Since proper equipment is usually beyond the means of the majority of settlers, it was necessary to promote the organization of small land clearing associations, for the collective purchase and use of such equipment.

On the Salvador Stock Farm north of Napa, has recently been installed an electrical irrigating plant. Mr. Wheatley has also secured a tractor and is busily plowing under a fine crop of vetch in his orchards.

Directors of a newly formed million-dollar agricultural implement company in South Africa are soon to visit the United States to get suitable machinery for sale there.

Sales approximating \$3,500,000 are reported to have been made at the Chicago Automobile Show which closed Feb. 3.

An order for thirty Sieve Grip tractors or five carloads, was cabled March 31 to the Samson Iron Works from Europe.

Use Dynamite On Your Farm

If you have never used Hercules Dynamite on your farm you have no idea of the many tasks it may be made to perform—and perform more quickly, more thoroughly, and much more cheaply than can the methods usually employed.

In irrigation and drainage work especially does Hercules Dynamite prove its superiority. To run an irrigation ditch or a drain by its use is child's play when you consider the effort and time necessary to accomplish the same work with pick and shovel.

You simply plant the charges along the prescribed course. Connect with the blasting machine. Fire. There is the ditch. If you want to dress it up a bit, well and good. But usually it's ready for use just as the dynamite leaves it.

HERCULES DYNAMITE

is also most valuable for the work it does in tree planting—an operation which, by the way, can be performed as well by no other means.

Every progressive farmer is familiar with the almost phenomenal crop results that have been obtained in this way. Many, however, have not tried it on their own land. How about you?

In your own interest, in the interest of your farm, you should write us for a book which we have prepared on the

subject of the use of dynamite on the farm. It is called "Progressive Cultivation," and is sent free on request.

In it the subjects already mentioned, also many others such as tree planting, road building, land clearing, etc., are fully discussed and the best methods to follow carefully explained.

You will find the book well worth having. Write for your copy today. Please use the coupon below.

LAYNE & BOWLER

Protect Your Crop

Don't take a risk this year, when prices will be sky-high. A failure of your entire crop is possible if your water supply fails you at the critical time. There is one certain way to be assured of success—that's the Layne & Bowler way.

A Layne & Bowler Pump will positively produce the greatest amount of water at the least expenditure. Get in touch with us at once. Let the World's largest water developers solve your pumping problems.

Ask for Catalog No. 25.

Layne & Bowler Corporation
900 Santa Fe Ave., Los Angeles

The KROGH Vertical Pumps

New Type Vertical

Are automatically water balanced and require no adjustment of any kind. All weights of shafting and rotating parts are carried on the water film absolutely without the use of thrust bearings or adjustment of any kind.

No BALANCE RINGS or PLATES in KROGH PUMPS. They are unnecessary, and mean only continual trouble. KROGH PUMPS with the least number of parts means less friction and greater efficiency. Get our Bulletin No. 78 before deciding on a pump.

Krogh Manufacturing Co.
SAN FRANCISCO. LOS ANGELES.

POWER NOTES.

Registrations by the State Motor Vehicle Department totalled 230,608 on Jan. 1.

A carload of Yuba tractors have recently been sold to bean growers of Knights Landing.

Motor speed should be reduced as much as possible while driving in low, to avoid overheating.

'Educational orders' for ammunition shells are advocated and practiced by the Hudson Motor Car Co. to give automobile factories the experience necessary to quickly convert them into efficient shell factories.

The Pacific Vinegar and Pickle Works of Hayward have found it necessary to increase their water supply, and have installed a 12-inch Layne & Bowler pump, direct connected with a 10 h. p. motor, to furnish water for their plant.

The Samson Iron Works of Stockton have sold out to the General Motors Corporation, which proposes eventually to double the size of the plant and increase the number of men employed to 600. This corporation controls the output of Cadillacs, Oldsmobiles, Chevrolets, Oakland, Buicks, and G. M. C. trucks.

A rubber hose connected to the automobile exhaust is used by W. D. McCroskey in San Bernardino County to dope the gophers and ground squirrels. Fred Clark of Kern County also worked the plan successfully. He plugged all the holes he could find and stuck the hose into a central one. Soon he found 24 other holes in 1/4 acre from which the smoke issued. He figures better success that way than with poisoned barley.

DYNAMITE NOTES.

Don't tamp with an iron bar; use wood.

Never pick at the white contents of a cap.

Don't tamp hard until seven inches of well pressed soil is over the charge.

In handling dynamite, if one wears canvas gloves, he may escape a headache.

When hauling, wrap boxes of dynamite in a sack or blanket to protect from jolting.

When putting a fuse on a cap have three inches of the end straightened so cap will easily slide over.

Never carry blasting caps loose in a pocket nor leave them loose in a dynamite box where crimper or knife may strike against them.

TRACTOR PAID FOR SELF IN ONE JOB.

[Written for Pacific Rural Press.]

J. D. Reavis landed a tractor-selling job in Imperial Valley because he did a good job of plowing while working for H. E. Owen. He plowed 300 acres north of Imperial, averaging eight acres per ten hours with a 12-24 h. p. machine, weighing 4800 pounds. He was paid \$3.50 per acre for the job, totaling \$1050. The tractor had cost him \$950. Out of the \$1050 he had to pay for 565 gallons of distillate and 75 quarts of medium lubricating oil. At that, he practically paid for his tractor with 37 1/2 days of his own time, and had a new tractor left.

PREFERS LARGE TIRES.

[Written for Pacific Rural Press.]

Large tires on the auto puts less weight on them per square inch, make them last longer, and make the riding enough easier to pay the extra cost, says Joel Anderson of Imperial County, who has run one small car over 65,000 miles in four years for pleasure and farm business. He uses 3 1/2-inch tires in front and four-inch tires behind, one set lasting about a year. The easier riding of big tires also reduces repairs on springs and machinery.

More than 34,000 farm tractors will be used during the coming season, according to the United States Department of Agriculture, which has obtained its data through letters sent to 32,000 selected correspondents.

A Letter from a Belt User

(never one like it before—from a belt user)

PETALUMA BOX COMPANY, Inc.
PETALUMA, CALIFORNIA

New York Belting and Packing Co.
San Francisco
Gentlemen:

Your last shipment of **Test Special** belting came duly to hand. Please accept our thanks for promptness in filling this order.

We are now using this brand of belting on a good part of our plant and have found it so satisfactory that we are replacing all worn out belts with "**Test Special**."

We have placed this belt on high speed machines and in places where severe strains and overloads are carried, and our experience is that it carries the loads and lasts longer than the best grades of leather or Balata belting. **It lasts longer**

We find that it is not effected by heat or moisture, will not tear at the lacing and will last for six months on a run that wears out the best grade of belt in three months. **Not effected by heat or moisture**
Outlasts leather

We do not hesitate to recommend "**Test Special**" belting for use for any purpose for which a belt is used. **Recommended for all purposes**

Yours very truly,

V. L. Fraser
Petaluma Box Company

Prize Cows Milk True to Breeding

Winners of Pacific Rural Press Prize in Dairy Cow Competition Show Unusual Producing Capacity in Spite of Feed Handicaps.

Somewhere in the distant past there is usually found a mighty good reason for a dairy cow or cows producing an unusual yield of butter fat and such is the case with the five Holstein cows owned by F. J. Kell of Stockton, who won Pacific Rural Press prize of \$25 for the five best grade cows entered in the California State Dairy Cow Competition during March by producing an average of 71.050 pounds of fat.

Early History.

The known history of these three-year-old second calf cows as well as the rest of Mr. Kell's herd dates back in most instances, 30 years, to a time when the elder Kell established a large dairy in San Joaquin County. During all of those years, till two years ago, the herd was carefully culled and purebred bulls were used, the result being that it was considered one of the best herds in the county. When the herd was dispersed Mr. Kell, Jr., used a good deal of care in selecting heifers which he knew to be from the best producing cows in the herd and out of a bull with good records back of him, that had previously been used on a purebred Holstein herd. Most of his purchases were confined to yearling heifers of this kind, and it is to the care exercised at that time that he credits most of his present high production.

Care of Heifers.

As calves the prize winning cows were given the same care and feed that is Mr. Kell's present practice. They were fed about nine pounds of whole milk a day with some grain and alfalfa hay and given shelter to protect them from the weather. A calf that is never stunted has a better chance to become a producer when fresh than one that is half starved when young, and Mr. Kell believes in generous feeding. The usual practice is to breed the heifers so that they will freshen at 20 to 24 months old. He never keeps a first calf heifer for his own herd, believing that they are more apt to make small cows.

Before Freshening.

Ten months is the lactation period adhered to by Mr. Kell because he has found that to produce a maximum amount of milk a cow should have two months rest during the year. But he doesn't believe in al-

lowing a cow to go down in flesh at that time. Instead, he feeds some grain along with his hay to the dry cows, so that they will be a little fat if anything before freshening.

Since the establishment of the San Joaquin County Cow Testing Association the entire herd has been tested for butter fat each month and by this means the low producers have been weeded out. He does not believe it advisable to sell a heifer because she does not produce heavily the first year as it has been his experience that many times a heifer of this kind will develop into an exceedingly good cow with her second calf. But however much or little milk a cow gives it must test high in butter fat, 3.4 per cent being the minimum requirement, and a higher test is preferred. With that object in view he is careful in the selection of his herd sires to see that they come from high testing ancestors. Protection against unfavorable weather conditions and mud is another influencing factor on

The Kell Dairy.

This dairy is provided with a combination feed and shelter barn 70 feet square with a hay mow in the center 30 feet square, allowing a 20-foot passageway on all sides of the mow for the cows to rest or eat. The sides are boarded with rough lumber and a water trough is provided under the roof for drinking purposes.

The Feeds Used.

Alfalfa hay was used in the early part of the winter but the supply was exhausted about the middle of March and a poor grade of volunteer oat hay had to be substituted. All of the alfalfa hay was fed in chopped form but the volunteer hay was fed whole. Some oil cake was fed but was omitted from the ration the last 10 days of March. A half acre of wild feed in a young orchard was all of the pasture available. Suremilk was used in the ration of all the cows, 11 to 12 pounds per day being fed to each cow three times a day. All cows were fed and milked three times a day.

Description of the Cows.

No. 66 was the highest producing cow of the five entered in the competition during March. When she freshened with her first calf she came in in bad condition and did not do so well her first lactation period. She is out of a good cow that was sold from the original Kell herd. She

"This is for you, girls!"

It's the most wonderful separator I ever saw. I just brought it from Johnson's Hardware Store where they were demonstrating it. You can't guess what it will do."

"I think I know, father. You told me last week about the loss of cream in our old separator when I turned it too slow. You timed me and pretty near scolded me when you found I was turning 37 revolutions instead of 50. This is the separator that "skims clean at any speed". It's a

SHARPLES SUCTION-FEED CREAM SEPARATOR

"Mary is a smart girl, mother—she guessed it. We all helped to test it and it skimmed to a trace when turned as slow as 36 and equally clean when turned as fast as 55 turns. It simply skimmed faster when we turned it faster. And the cream remained at 35% thruout the varying speeds."

"Why, father—then we will know exactly what the cream check will be each week, wont we?"

"Indeed we will, mother. Now look at the bowl. It's a plain straight tube with a small ring like a napkin ring in it.

"Goody!—I'll get thru washing up in a jiffy, no discs!"

"Yes, girls, and note the knee-low supply tank, and the automatic once-a-month oiling—it has any other separator I ever tried, beat a mile. But then—it's made by the oldest and largest Separator Works in America."

Do You Want Long Distance Backing?

We have a son of the California State Champion three-year-old for sale. Born October, 1915; Sired by PRINCE ALCARTRA KORNDYKE, whose dam is TILLY ALCARTRA.

The Dam of this young bull is not a fifty-lb. cow, but she has to her credit 21,208 lbs. milk and 860 lbs. butter in one year, which is the largest record ever made in California by a Junior three-year-old.

If you are in the market for a bull, it will pay you to visit our ranch and see what we have to offer—at prices that will surprise you.

J. S. GIBSON CO., Box 97, Williams, Cal.

F. STENZEL, San Leandro, Cal.

Breeder of High Test Holsteins.

freshened February 22, 1916, with her second calf and was fed a total of 1000 pounds of hay and 300 pounds of Suremilk. The cow tester's report showed her milk testing 4.1 per cent fat, her total production for the month being 84.315 pounds of butter fat.

No. 63 was second, with 78.566 pounds of butter fat during the month, her average test for March being 3.6 per cent. She calved January 24, and during February produced an average of 62.6 pounds milk daily, testing 3.6 per cent fat, her ration during that month being 1000 pounds alfalfa hay, 240 pounds Suremilk and 120 pounds dried beet pulp. During March she was fed 1000 pounds of alfalfa and volunteer hay and 360 pounds of Suremilk.

She is a well formed cow and her mother was a purebred cow that was never registered. Mr. Kell states that her dam was a heavy and consistent milker, giving 60 to 65 pounds milk a day when reasonably fresh and milked twice a day in the string.

No. 1, third in the list, has the appearance of a well bred Guernsey. Her mother was selected as the best cow from a large herd of grades and her sire was a registered Holstein used in the Kell herd. She freshened February 24, and during March produced 70.562 pounds of butter fat, the cow tester's report showing her average test to be 3.8 per cent butter fat. During the month of March she was fed 1,000 pounds of alfalfa and volunteer hay and 360 pounds of Suremilk.

No. 65, fourth in the herd, is a big, well formed cow whose dam was also a purebred but unregistered. The dam, when reasonably fresh, gave 50 to 60 pounds of milk, averaging right around four per cent fat, according to Mr. Kell.

This cow freshened the middle of January and the cow testing records show that she produced in February an average of 63 pounds of 3.9 per cent milk, being fed during that time 1,000 pounds alfalfa hay, 240 pounds Suremilk and 120 pounds of dried beet pulp. During March she produced 65.838 pounds of fat with an average test of 3.7 per cent fat, having been fed during that time 1,000 pounds alfalfa and volunteer hay and 360 pounds Suremilk.

No. 102 is a comparatively small cow for a Holstein, black in color, and according to Mr. Kell out of one of the best cows in the elder Kell's herd. She was hooked in the barn by another cow before calving and lost her calf, freshening January 19. During February she produced an average of 56.2 pounds of milk testing 3.6 per cent butter fat daily on a total of 1,000 pounds alfalfa hay, 240 pounds Suremilk and 120 pounds of dried beet pulp.

During March she gave 55.967 pounds of butter fat, her milk having an average test of 3.4 per cent fat according to the cow testing records. During that month she was fed 1,000 pounds of alfalfa and volunteer hay and 360 pounds of Suremilk.

Summary.

An analysis of the high records of these cows leads to the conviction, first, that sire and dams transmitted heavy producing qualities; second, that the feed before freshening played an equally important part as the feed after freshening; and third, that the three-time-a-day milking was an influencing factor.

SOME GOOD RECORDS.

Alex Whaley reports the following recent seven-day records for his El Dorado herd of Holsteins: Colona Johanna Hartog, butter 28.63 pounds, milk 579; Beauty Snowflake Hengerveld (four-year-old), butter 24.24, milk 432; Colona Beauty

Colona Johanna Hartog 148031.

Butte Maid (twenty-three months old), 19.44, milk 426; El Dorado Winifred (twenty-two months old), butter 15.21, milk 347; Prunetta Lady (junior two-year-old), butter 14.73, milk 375; Madrigal Beryl (junior three-year-old), butter 17.68, milk 329.

TWO-YEAR-OLD SILAGE.

Early in April we found Superintendent Vandever of the New England-California Corporation feeding out silage that had been put up two years ago and the silage was as well preserved and sweet as any we ever saw. There are two silos on this ranch with a combined capacity of 250 tons, that amount of silage being produced on twenty acres of bottom land.

Mr. Vandever uses white dent seed corn, drilling it in with a corn planter just as soon as he can get

CUTTER'S BLACKLEG PILLS

"California's Favorite" for nearly 20 years

For the Prevention of Blackleg in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock. Use any Injector, but Cutter's simplest and strongest.

Prices:
10 dose pkge. Single pills \$1.00
50 dose pkge. Single pills 4.00
10 dose pkge. Double Pills 1.50
50 dose pkge. Double Pills 6.00
Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

GET RID OF LICE

Let your hogs rid themselves of these blood sucking pests and keep free from cholera.

to it in May, although he has planted as late as July 4 and got a fine yield of silage corn. Not only does he consider silage an ideal feed to use with alfalfa hay for dairy cows, but he also thinks his silos are an excellent insurance against feed shortage.

Why Purebred Bulls from the East?

To the Editor: One of the railroads tapping some of the southeastern states is said to be offering just as generous facilities to stock raisers as the late Jim Hill ever offered, while the successors of Hill now find it necessary to work just as hard to place Canadian farmers in a position to raise beef as they formerly did to get them to raise wheat.

Buyers from these and other sections are to be met at all the breeders' sales in the middle states and said buyers are reported as traveling around without being taxed much real money for transportation, either for themselves or their purchasers. The railroads figure, no doubt, that concessions made on a few carloads of breeders going in now will be amply recompensed when scores of carloads of beef are ready to come out. Carloads of breeder stock, it is said, are being shipped as feeders on a round trip rate, which carries no time limit.

Although there are a few Californian stockmen quietly becoming interested, this beef production enthusiasm does not seem to have hit this state with noticeable force so far, although California offers just as good, if not better, facilities for the beef industry than any territory on the continent. Various reasons are put forth for this lagging. Perhaps the most novel excuse was that offered by a well-known California beef cattle man who has watched livestock movements here for thirty

years. He complains there is a survival of quite a little of the old-time clannishness and jealousy among some of the breeders which prevents them from trading with each other; that he has known several cases where a breeder having no further use for some good bull, placed a prohibitive price on the animal rather than see it working for another herd, the result being that the would-be purchaser was compelled to look to the East for what he wanted.

It is at this stage that the professional buyer steps in and gets the order. The latter is not always looked upon with favor in some quarters; but until the breeders themselves get into shape to supply the increasing demand for good bulls for the ranges and show a little more liberal trading spirit among themselves, the trustworthy buyer will find a demand for his professional services.

But even now there are probably ten men who demand high class bulls today where there was only one a few years ago. Registered? Yes, usually; and the majority are now agreed that they must have individual merit; and if some of them give a little more attention to the females, there can be no doubt that California would soon be in a position to supply the local demand, and—who knows—possibly ship a few good specimens East. All of which is encouraging. — R. M. Dunlap, San Francisco.

Prospect for Good Shorthorn Sale

W. M. Carruthers advises us that he has received letters from all of the prominent Shorthorn breeders in this and adjoining States, stating that they will be in attendance at his first annual sale of Shorthorn cattle at Mayfield, May 2. Particular interest is being taken in this sale by breeders, as it is the first time for years that a choice offering of females has been offered at auc-

tion and it is agreed by those who have visited the ranch recently that the collection of heifers in this lot is of unusual merit. In the bull offering also there are a number of "toppers" as well as some rugged, thick-meated range bulls, and as the supply of this kind of bulls is limited both here and elsewhere it is expected that range men will swell the attendance materially.

Choice Shorthorn stock to be offered at Mayfield, May 2d.

LAMBED 150 PER CENT.

To the Editor: The following record may be worthy of publication, particularly in a State where it is largely the custom to destroy one of twins in sheep; and to show what is possible when the herd is kept in first class condition and well cared for.

From 52 high-grade Shropshire ewes ($\frac{3}{4}$ and $\frac{7}{8}$ grades) and a purebred Shropshire ram, I have secured the following yield: 79 well-developed

healthy lambs, 44 male and 35 female, an increase of 150 per cent; loss, six lambs, 2 still-born, two of a set of quadruplets, and the weaker of twins which the ewes would not recognize. The total loss was therefore 1 1-15 per cent of the bearing ewes, and slightly over one per cent of the total number born. Some of these lambs are so vigorous and true to type that they have been purchased by neighbors for breeding purposes. If any flock can beat this record I would like to learn the particulars.—Marsden Manson, Billota.

Hog Raising on Hill Lands.

[Written for Pacific Rural Press.]

By utilizing every little cleared place on the hills of their ranch as well as fields that are so steep that the cost of harvesting would be prohibitive, Bishop Bros. turn off 300 to 325 well-finished hogs annually from their ranch in the San Ramon Valley, Contra Costa county, without, as Superintendent Rutherford says, missing the feed or expending much labor. The natural conditions of the ranch are favorable to the economical raising of hogs inasmuch as much of it is hill land that is chiefly suitable for grain. Along a considerable portion of this hill range is a stretch of oak timber which provides both shade and feed, the latter being acorns. This feed supply, together with plenty of spring water, permits hog raising with a minimum of labor.

The sows, which are highly graded Poland Chinas of a blocky compact type, farrow once a year, about April 1. A couple of weeks before farrowing time they are taken to the ranch headquarters and fed till about 10 days after farrowing by which time the pigs have learned to stay with their own mothers and the sows have learned to care for their pigs.

By that time the green feed on the hills which were harvested the year

previous and which are allowed to volunteer alternate years, is in good condition and provides pasture for both sows and pigs till after harvest on the rest of the grain land. Then the stubble and the small fields and patches of land which have been seeded expressly for hog pastures are used till the beginning of the rainy season, when the timber pastures and acorns are utilized, the hogs being carried on these pastures till spring feed is again in good condition. By harvest time they are of a proper size to finish for market on the stubble, being turned off at 16 to 17 months old weighing 220 to 250 pounds and being in the best possible marketable condition.

At times it is found necessary to hand-feed a few of the last lots shipped every fall when feed is so scarce that the hogs have to rustle hard; but in the main no hand-feeding is practiced except at farrowing time.

It is the belief of Mr. Rutherford that the steep hill lands of many ranches can be more profitably farmed with hogs in this manner than in any other way, particularly where plenty of good water and shade can be secured by the hogs.

Don't Sell Breeding Sows.

[Written for Pacific Rural Press by John P. Walker, Visalia.]

I would like to impress on the minds of Pacific Rural Press readers the condition of the swine business of today as I see it.

For a good many years hogs in California have been a by-product of the ranch. People had been keeping only a small amount of hogs to consume the waste, such as skim milk, alfalfa, and pumpkins. Now comes a shortage in food products. Was the farmer prepared with hogs? There comes the rub. He has sold off all of his fat hogs, feeders, undesirable sows, and boars. What comes next? Your spring pigs will go as soon as they are old enough. What will happen by fall?

Tulare County alone has shipped out over 74,000 hogs to the market in the last eight months. Can we raise that many more in the next eight months? If not, what will hogs

be worth? As near as I can guess, it will take about three years for pork to go below 10 cents.

It is up to the farmer now to begin to figure for tomorrow and not sell his sows.

He should be buying more and better sows, to produce him more and better pigs for a quicker market. If you ask a farmer \$40 for a bred gilt, he will think you are insulting him. He does not stop to figure that a good sow will bring him 12 to 20 pigs a year. If he figures a little more he will find that sow is bringing him two to five hundred dollars.

The trouble with the most of us pure-blood men is that we do not try to educate the average farmer along those lines. So, Mr. Purebred Breeder, it is up to you to demonstrate what you can do; and when you have done that, we will have more and better hogs for California.

FRESH WATER FOR HOG WALLOWS.

[Written for Pacific Rural Press.]

A unique way of providing the hog wallow with fresh water is in use at the Whittier State School. The wallows at this institution are located in the center of concrete feeding platforms, being shallow in depth and inclined at either end to

allow easy access. Directly above each wallow and continuing overhead across all of the pens is a one-inch pipe. Faucets are located along this pipe, and by regulation as much or as little water may be allowed each wallow as seems desirable. Most of the time all that is required to keep the wallow pure is a slow steady drip.

Your Outstanding Poland-Chinas, Sunnyside Ranch, R. F. Guerin, Visalia, Cal.

The 100% Silo

is the silo that's built of California Redwood. Think up all the good points a silo material should have—you'll find *every one of them* in

California Redwood

Resists rot and fire

Permanent—contains a natural preservative that prevents decay. Not affected by sun, rain or violent changes of weather.

Will not shrink, warp or swell, when properly seasoned.

Non-conducting—Redwood retains the heat necessary for perfect fermentation of silage, keeps out cold, prevents freezing.

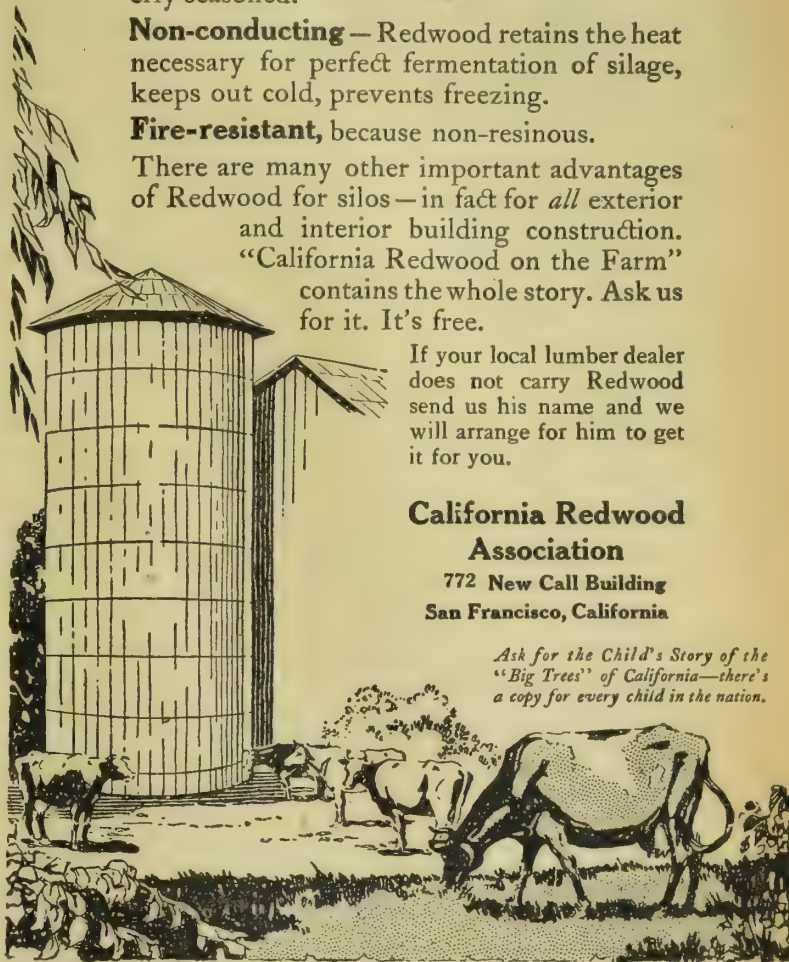

Fire-resistant, because non-resinous.

There are many other important advantages of Redwood for silos—in fact for *all* exterior and interior building construction. "California Redwood on the Farm" contains the whole story. Ask us for it. It's free.

If your local lumber dealer does not carry Redwood send us his name and we will arrange for him to get it for you.

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. P. I. E., 1915; Sacramento, 1916.

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Young stock, \$30 Up.
M. BASSETT,
Box 1, Hanford, Cal.

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy

A dairyman in Marin county recently lost 23 hogs which had eaten some meat of a cow which had died of anthrax.

W. J. Higdon recently sold his herd of registered Guernseys to A. J. Welsh of Redwood City. The herd consisted of 25 head, consisting of 12 cows, three bred heifers, two herd bulls and eight head of young stock.

N. H. Locke Company sold to W. F. Smith of Cottonwood, a fine young bull, a grandson of King's Valet and of Gertie's Son.

F. D. Ross, Hanford, recently sold to Rea Clark for \$300 an eight-month-old bull sired by his herd bull Creamcup Fidessa Cornucopia De Kol.

Golden Maid of Mable Lane, a Guernsey cow of the Grapewild Farm herd at Escalon finished her yearly test on April 24, with a record of over 600 pounds fat.

Dairymen of the central counties have organized the Central California Milk Producers' Association, the primary object of which is to determine the actual cost of production.

Entries are coming in for the big two-day Holstein sale which will be conducted by California Breeders Sales and Pedigree Company at University Farm, Davis, May 31 to June 1, during Farmers' Week. It is expected that around 180 head of registered Holsteins will be sold, drafts from a large number of the great herds of California.

Beef Cattle.

Eighty-four head of Shorthorns at the Portland Union Stock Yards Sale brought recently \$23,530. Fifty-one bulls averaged \$267 and 33 cows averaged \$323. Nine head consigned by the T. B. Gibson Estate brought an average of \$315 per head.

Swine.

Arlington M. Smith reported following recent Berkshire sales: Five gilts to E. B. McFarland, Sacramento; one boar to S. Uzuka, Fresno.

Dr. J. A. Crawshaw reports recent Poland China sales as follows: Two sow pigs to J. F. Wilson, Pelot Hill; to E. W. Root, McFarland; one boar to J. W. Melone, Laton.

Following is a list of recent shipments by Haden Smith, Woodland: Boar to Chas. Dumars, Yolo county; bred gilt to R. P. Wilkes, Placer county; bred sow, three gilts and a boar to Carrol Kauffmann, Yolo county.

Sheep and Goats.

The high price of mutton and lambs on the Los Angeles market and ready sale of both is attracting the attention of moneyed people to mutton growing as an investment.

Sheep shearing is about closed in the McKittrick portion of Kern county.

Holstein Breeders Meet.

A very enthusiastic and well attended meeting of Holstein breeders was held at the Hughson Hotel, Modesto, on Wednesday evening of last week. A new constitution and by-laws were adopted. The board of directors was appointed as follows: Delancy Lewis, San Jose; K. W. Abbott, Milpitas; Owen Duffy, Napa; H. K. Bridgeford, Knightsen; Gion W. Gibson, Williams; F. J. Kiesel and J. M. Henderson, Jr., Sacramento; Frank Morris, Woodland; A. R. Magruder, Ripon; Frank M. Helm, Fresno; W. J. Higdon, Tulare; A. J. Stalder, Riverside; W. H. Taylor, Santa Anita; Jas. McAllister, Jr., Chico, and James Jeffries, Burbank.

Dr. Keane, State Veterinarian, spoke to the breeders on the new dairy law, showing what it is doing to eradicate bovine tuberculosis. Judge Shields, in a very entertaining talk, touched on the choosing of a herd sire and scientific breeding. Frank Morris called attention to conditions favorable to dairying and breeding such as food shortage, organization of producers and standardizing products. He said in the high price of feed a good thing is that it would eliminate the scrub. J. M. Henderson, Jr., advocated breeders helping the milk producers in their efforts toward organization for a better product and a better price. President F. J. Kiesel announced future Holstein meetings as follows: Napa, May 5; Chico, May 23 and June 6; University Farm, Davis, June 18.

Stanford Ranch Purebred Holstein Sale.

Inquiries from all parts of the United States are being made regarding the determination of the board of trustees of Leland Stanford, Jr., University to dispose of the entire herd of more than 300 registered purebred Holsteins on the Stanford ranch at Vina, Cal. M. H. Tichenor of Palo Alto, who has been commissioned to sell the herd, says that the entire herd will be sold at auction at Vina on June 5, 6 and 7.

Since the Holstein herd at Vina was established by the late Governor Stanford, a third of a century ago, it has been steadily improved by the introduction of the most notable blood strains. As a result, exceptional opportunities will be afforded the advanced breeder and the dairyman to improve his herd. Because of limited accommodations at Vina, arrangements have been made for a special train from Chico to Vina each morning of the sale. The return run will be made at the close of the day.

A Most Successful Stock Sale.

The sale of registered Holsteins held by California Sales and Pedigree Company for H. E. Cornwell of Modesto on April 19 was well patronized. Twenty-eight head of stock were sold for a total of \$10,-

740, or an average of \$383 per head. The highest price paid was \$1,100 for a son of Prince Gelsche Walter, sold to W. J. Mitchell of Visalia. The top-price cow went to A. M. Bibens for \$810. W. J. Higdon paid \$1325 for three fine

cows. Following is a list of the buyers: W. F. Mitchell, Visalia; H. R. Leek, Alpaugh; A. M. Bibens, W. E. Oakes, G. W. Shirk, J. E. Vann, J. R. Pearson, H. T. Johnson, Wm. Breazeal, R. L. Holmes, L. Schmitz, Geo. N. Pfarr, W. F. Lath-

ADVANCED BREEDERS! BEGINNERS! DAIRYMEN!

Grand Holstein Herd WILL GO AT AUCTION

300

Registered
Pure Breds

BOWEDA

Complete Dispersal of
the Unequaled herd on
Leland Stanford Jr.
University Ranch.

At Vina,
California,
June 5, 6 and 7,
1917.

One of the many great specimens. Record
of 31.92 pounds of butter in seven days.

At this great sale of black and white aristocrats, many females with records, herd bulls, and young bulls old enough for immediate service will be auctioned without reserve.

40 A. R. O. cows are to be sold together with many others capable of great records. Never before have so many good prospects for A. R. O. work been offered.

Since the late Governor Stanford established this herd many years ago, it has been constantly improved by use of the best bulls procurable. The butter fat records during the past year proved the herd to be one of the greatest in the world.

In the herd, to go to the highest bidder are 40 daughters of King of the Pontiacs 14th, 84332, best individual son of King of the Pontiacs and one of the greatest show bulls in the West; 20 heifer calves of Segis De Kol Pontiac Burke, 160339, all great prospects; 40 daughters of Dutchland Colantha Sir Ormsby, 55055, a great son of Colantha Johanna Lad, all making great records; Genesee Lad, 90356, and 45 very promising daughters.

Special Trains Will Be Run
Between Chico and Vina
Each Day of the Sale.

Important Shorthorn Sale.

Mr. Colomb of the firm of Barton & Colomb, owners of the Barco herd of registered Shorthorns at Hollister, advises us that they have just completed the sale of a foundation herd of registered cattle to V. A. Carlyle of Sanger, Fresno county. The lot consisted of 19 heifers and one of the choice young herd sires that has been in use on the Barco herd. Seventeen of the heifers are bred to the bulls Hallwood Flash and Hallwood Villager and one other of the Barco herd sires. Mr. Colomb says there are several outstanding show heifers in the lot. The Carlyle ranch embraces some 5,000 acres of range land which is stocked with well bred range cattle.

REAL Holstein Quality

If you are in the market for a young bull that will improve the type and production of your herd, let us quote you a son of one of the following proven sires—

SEGIS PONTIAC DE KOL BURKE—Grand Champion State Fair 1916. His sire and dam both Grand Champions. His dams record of 124.5 pounds milk a day average for thirty days is the second highest in the world. And best of all he is transmitting this type and production. His daughters just coming in milk have produced as high as 23 pounds butter in seven days as 2-year-olds.

KING MEAD OF RIVERSIDE—The sire of the present State record cow, Aaggie Acme of Riverside 2d, that has produced in 120 days official test 529 pounds milk and 10,424 pounds milk. She is his first daughter tested at mature age. They average 4 per cent butter fat.

PRINCE GELSCHER WALKER—One of the best bred bulls in the world and whose daughters have broken six or more State records as two and three-year-olds.

A few of their sons from high-record dams now available at moderate prices.

A Banker's Experience in Financing Dairy Farmers.

(Continued from first page.)

the better dairyman he becomes the more certain are we that his deposits with us will be enlarged in later years.

Poor Cows Poor Risks.

"Naturally, many poor cows have been purchased; and we have at all times encouraged borrowers to dispose of them at beef prices rather than keep them in their herds. In such cases we agree to loan additional money for the purchase of a good cow. For instance, a dairyman might have paid \$80 for a cow and find she can't earn her keep. We advise him to sell her to the butcher for, say \$50, and loan him an additional \$50 to buy a good cow. True, we have more money involved in the deal, but we are surer of getting it than if the farmer kept the 'boarder.' Good cows are more plentiful now than they used to be; so we advise every new borrower to sell any cow that will not produce 300 pounds of fat in a year and agree to loan him enough more money to get a good one."

Financing Purebreds.

Not only has Mr. Flaherty's bank done an extensive loan business on grade cattle, but on purebreds as well. This is what he says in that respect: "Of course we early saw the desirability of purebred herds in the community; and as the Jerseys seemed to prove entirely satisfactory, we have financed the purchase of approximately 100 registered Jerseys during the past two years. We realize the advantage of community breeding centers and are lending our support to the purebred Jersey movement in the hope that this may become the Jersey breeding district of California. Our loans on purebred cattle have been made in the same manner as those on grades, except that the purebreds have been insured against accident and sickness with a reputable insurance company. Two or three of them died, but we always received their full value from the insurance company."

Several times during our conversation, Mr. Flaherty emphasized the belief that anything which makes the farmer more prosperous is certain to be reflected in the deposits of the country bank. Nothing more clearly proves his sincerity in this than the following statement: "This year we are going still further in our attempt to finance the dairy industry by setting aside \$10,000 which will be loaned to dairymen for the purchase of silos. These loans will be made on open notes, but the financial responsibility of the borrower will naturally be an important factor. This, we believe, should improve the risk on our dairy cattle loans and add to the financial resources of the community at the same time."

Bankers Benefit.

From a farmer's standpoint the arrangement was bound to be satisfactory, especially in view of the fact that in many instances the bank financed the entire transaction and has been lenient with borrowers at times when such leniency seemed to be warranted. But bankers will be more interested in knowing how it has developed the banking field of Glenn county.

Probably the best evidence that it is thoroughly sound and practicable is the fact that every bank in Glenn county now does a cattle loan business; but a more concrete example of the benefits may be seen in the report of the bank with which Mr. Flaherty is connected. There it is shown that in less than four years the bank has increased its deposits from nothing to over \$220,000. "Of course," he remarked, "this is not all due to the loans we have made on dairy cattle; but we attribute no small amount of our success to that feature of our business, as it has induced more prosperous conditions for our farmers. Neither do we assume credit for the rapid strides the dairy cow is making in this community; although we believe we have contributed our share towards her advancement."

SHEEP TO EAT WEEDS.

[Written for Pacific Rural Press.]

Sheep just to clean up weeds and a little alfalfa on a small place are kept by Tom Dutra of Stanislaus County. They cost nothing and return a nice profit in wool and lambs. Mr. Dutra got a grade Hampshire ewe in the winter of 1915-16. She was bred to a neighbor's buck and in May dropped two lambs. Along in September he bought a buck and bred these lambs in early December. The old ones were sheared in the fall, yielding, as Mr. Dutra remembers it, 13 pounds each of wool that sold at 16 cents per pound.

It took him about 15 minutes to shear each one. With the sheep upside down and its head between his legs, he started shearing at the neck, then sheared its belly and legs inside, then let it stand up while he sheared the sides and back.

A little shed is provided for shelter under a tree. The investment is small, feed negligible, profits high in proportion, and many weeds kept down.

PREFERS SLOP FEED FOR RANGE HOGS.

[Written for Pacific Rural Press.]

Although self-feeders have been found entirely satisfactory with hogs that have had some grain from time of weaning to fattening on the New England-California Corporation's ranch in San Joaquin county, Superintendent Vandever states that he has not secured such good results with hogs that have been allowed to range on the bottom lands of the ranch from pignood.

His objection to the free feeder system with such hogs is that, not being accustomed to a regular supply of grain before them at all times, they eat too ravenously and do not digest their feed as well as they should. For that reason he prefers feeding his grain soaked in the form of slop to his range-raised feeders.

Wash your hands and put on clean clothes before milking. Do not milk with moist hands. The practice tends to contamination.

COWS LOVE SALT AND MUST HAVE IT

Experiments Prove That Without It Their Vitality Suffers and Their Milk Runs Low.

Simplest Method of Supplying Needed Amount Is to Salt Hay While Stacking or Baling.

Salt is such a common thing that the very important part it plays in the health and milk yield of the dairy herd is perhaps not realized by many farmers.

Experiments conducted at the Wisconsin State Experiment Station prove conclusively that salt should be supplied to dairy cows unless the ration furnishes a sufficiency thereof. It is calculated that the minimum quantity in the food to keep a cow of 1000 lbs. live weight in flourishing health is that which is equivalent to $\frac{1}{4}$ oz. of salt per day, and that a cow in milk needs as much more as will restore the proportion removed in the milk, namely, a little over $\frac{1}{2}$ oz. of salt for every 20 lbs. of milk.

The conclusions from these experiments are briefly as follows:

"In every case the cows exhibited an abnormal appetite for salt after having been deprived of it for two or three weeks, but in no case did the health of the animal, as shown by the general appearance, the live weight, or the yield of milk, appear to be affected until a much longer time had elapsed. This period of immunity varied with individual cows from less than a month to more than a year. There was finally reached a condition of low vitality in which a sudden and complete breakdown occurred. This stage was marked by loss of appetite, a generally haggard appearance, lusterless eyes, a rough coat, and a very rapid decline in both live weight and yield of milk. If salt was supplied at this period recovery was rapid. In one case potassium chlorid was given instead of common salt (sodium chlorid). Considerable of the potassium salt was eaten, though cows ordinarily refuse to touch it, and recovery followed as quickly as when common salt was supplied—evidence that not the lack of the sodium but the lack of chlorin was responsible for the troubles. The breakdown due to the lack of salt usually occurred after calving, when the milk flow was heavy, and generally the cows giving the largest amount of milk were the first to show distress."

Farmers who salt their hay when stacking or baling have found the plan an excellent and profitable one. The salt more than pays for itself in the increased weight of the hay, and besides improving the feed, it removes the danger of musting by checking the growth of molds when the moisture content of the hay is high. This is particularly true of alfalfa hay.

Twenty pounds of salt to each ton of hay should be used, which should be sprinkled on by hand as each three feet of the hay is stacked.

Purebred Registered
HOLSTEIN CATTLE

In terms of dollars and cents the Holsteins are talking most effectively for themselves. Purebred Holstein cattle are the choice of every public institution or organization which attempts to produce milk in a scientific manner. Just ask a man who owns Holsteins, if you want to hear a story of prosperity. Every angle of Holstein superiority is fully covered in the books and pamphlets which are sent free for the asking. There's big money in the big "Black and White" Holsteins.

"Good to the Last Drop"

Raise Your Calves on Blatchford's Calf Meal and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Raising Poultry for Profit

ADVERTISING HATCHING EGGS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

In marketing your product, don't forget that the State Market Association is behind you, helping the small farmer and poultryman to come into his own. But always God helps them who help themselves and it is the same with this association. It won't pay to sit back and wait for the wagon to come along and give you a ride to an easy market. You must do your part.

If you want a city trade for fresh eggs you must advertise. Then you must have up-to-date, clean containers, with your name and the name of your farm or ranch on in nice large letters. We can't do business now without the printer. He is our main-stay in letting people know what we have to sell. And it takes a good bit of common sense to choose the right mediums for advertising. If you want to advertise hatching eggs you need a medium that circulates among the class of people that hatch and raise chickens. It would not be profitable to advertise in a city paper because, as a rule, city people are not interested in hatching eggs.

And there is a difference in city papers. If possible, choose the one that circulates among the people who have money to buy the things you have to sell. And no matter what you are advertising, don't expect to build up a profitable trade from one or two advertisements. Keep at it. If you are trying to sell to farmers or fanciers, you must remember that they are busy people and unless you remind them that you still have hatching eggs to sell, they will think you are out of business. Mr. Har-ker, of the Fanciers monthly, always says of an advertiser who stops his ad, "He is dead." And so far as business is concerned he is right, for there is no class of business so soon forgotten as the advertiser of hatching eggs. What I always did was to cut the ad down in slack time to just a card. This tells the reader that you are still in business and gives him your address. This method of keeping your name before the reader is much better than having a big ad for a few weeks, then dropping out of sight. This is the season when the spring advertiser is flush, shortly most of them commit the folly of dropping their ads, because they are sold out of stock or it is too late for eggs. Now if you value future business, don't do that, but reduce the size of your ad and keep your name before a public that always appreciates business rules.

HOW TO SELL.

If you have to sell hens to make room for your chicks, sell to reliable commission men if possible. If you are situated so that you cannot ship, and have to sell to the man at the door, stand up for your price. Good fat hens should bring 22 cents a pound; yet a neighbor was told by one man he could only pay 17 cents. And after you have agreed about the price ask to look at his scales. I don't say all these men who buy poultry and eggs at the small far-

mer's door are dishonest, but there is a big proportion of dishonest men in it.

CLEAN UP THE YARDS.

When removing old stock to make room for the growing young, all yards must be absolutely clean if you expect the young stock to thrive. If there is not time to grow a green crop on the ground, at least spray it well with some good germicide and then turn it over with a spade or plow. Cabbage or kale gives the best results in cleaning ground for poultry. These are both rank feeders and it takes some strong plant feeder to use up the droppings, or the gasses that are liberated from them, in order to make the ground sweet and clean.

QUESTIONS ANSWERED.

To the Editor: Had three hens die in about a week. On opening them, found white spots on liver; did not notice anything wrong with them until I found them dead; then their combs were a little dark, but did not notice any difference before they were dead. I feed sprouted barley in morning and wheat and gyp corn in the evening, with what bran and clabbered milk they will clean up during the day, and all the shells and grit they need with run of alfalfa patch. Can you suggest some remedy?—G. E. G., Tipton.

This trouble seems to be tuberculosis. If you have any more deaths I would suggest that you send the liver to the Davis Experiment Station. Your feed appears to be all right. There is some doubt that these hens may have had a congested liver, but it is either excessive use of condiments or starchy foods, or bad beef-scrap that causes that and as you do not mention using powders or mash feeds I feel sure it is not congestion. If it is tuberculosis it will pay you to

get rid of the whole flock, then clean and spray your grounds before venturing to put any more chickens on it. Until you know, it will be as well to give the flock a little liver medicine—ten drops of nitro-hydrochloric acid in a quart of drinking water will stir the liver to better action, and may do away with the trouble. Give this about three days, then rest three days and give another three.

Turkey Eggs Fertile Ten Days After Mating.—A hen turkey began laying three or four days after mating with male birds. Will these eggs be fertile? If not, how long before they will?—G. R. A., Wheatland.

[Answered by Susan Swaysgood.] All males must be with hens ten days before eggs are safe to hatch.

Don't allow the bull to discover his own power. Treat him with kindness, but firmness, and never allow him to be teased. Don't allow him to run with the herd.

"The Car of No Regrets"

KING EIGHT

60 HORSE POWER

UNFAILING SERVICE on FARM or BATTLEFIELD

Four luxurious body models mounted on the famous King chassis adopted for light armored cars by the U. S. Army and U. S. Marine Corps

FOURSOME—\$1585—(Shown above)—Designed for those who desire the sport type of car, with long, low, rakish lines yet in perfect taste. "Narrow and "racy," this car seats four in comfort, has lengthy leg-room and is provided with four doors. A locked compartment just behind the rear seat gives generous and convenient storage space. The two front seats are of the "bucket" type. At their back is a combination tonneau and handy lamp which may be removed from its socket and carried about the car. Color: deep maroon.

TOURING—\$1585—With all the advantages of a 120-inch wheel-base, this car has the roominess of a Six of 126 to 128 inches due to compactness of King V-type motor. Has many novel conveniences, and upholstery and finish are of the highest grade. The ideal large-family car. Seats seven. Color: dark green.

SEDAN—\$2150—A year 'round car of the most luxurious type, upholstered in highest grade cloth and equipped with divided front seats. Sides completely removable in a few minutes without leaving car, and as easily replaced. A special compartment behind rear seat is provided for storage of side sections. With sides in place this seven-passenger model becomes a perfect closed car, all sections fitting without possibility of rattle and with no appearance of being improvised. Three colors: beaver brown, deep maroon or suburban blue.

ROADSTER—\$1585—A very popular model with farmers, physicians and salesmen, because of large storage space. Has two roomy compartments; one behind front seat and the other under rear deck. Comfortable for three. Color: French gray.

ACORNS FOR POULTRY.

[Furnished by Prof. M. E. Jaffa, University of California.]

The practice of the use of acorns as a food by the American Indian is still kept up, and if the acorns were prepared for chickens in a manner similar to that adopted by the Indians, there would be no objection whatever to their use as poultry food, and no harmful results could follow. Acorns without any preparation, are used successfully in turkey raising, as they supply a certain bitterness which acts as a tonic for the turkey. With laying hens, however, it is a different proposition. The bitter principle in the acorn would probably cause digestive disturbances if extensively fed. They may be prepared, however, so that they will form a good food for poultry. The shelled nuts should be split, dried and ground with a mortar and pestle. The sifted meal

is placed in a convenient vessel and leached to free it from the bitter principles present. It seems not improbable that improved methods of removing the tannin and bitter principles in most varieties of acorns, might result in utilization of the acorn crop which is fairly large and generally wasted.

The leached meal could be used in the mash as a substitute for some of the mill by-products, provided a sufficient amount of some highly nitrogenous food was used, as acorns are low in protein. Just how much, would depend upon what were the other ingredients of the mash. A very small quantity should be used at first, and there is no reason why two to three pounds of the leached meal could not be used in the mash. When it is realized that the Indians use this meal as a mush or porridge, it is very easily understood that it could not be harmful in any way to fowls.

About Cedar Oil.

[Written for Pacific Rural Press by Susan Swaygood, Pomona.]

A subscriber writes me that according to what I said some time ago she applied cedar oil to her chicks, and when she wrote she was wondering whether they were going to survive from the effects. Now I can only say in this as in all other remedies, they must all be used with common sense. When that is lacking, no remedy is safe, for the little chick has only a slight hold on life to begin with and if a person takes hold and rubs a poison (all these things are poisons to chicks) into a chick's system at the point most sensitive, the head, why they are going to suffer and perhaps die.

I do like to be helpful, but sometimes I vow to myself that I will not tell anybody what to do in these cases again, for I hate to know of the torture little chicks have to endure at the hands of people who do not use common sense in applying them. What I said was to rub a few drops

under the hen's wings and on her breast, and also it would not hurt to stroke a little around the chick's neck. This lady gets a dish and goes to work rubbing it in the chicks' heads, wings, vents and all around the necks until they pant. If she had used one drop of cedar oil to ten drops of common sense the chicks would be as lively as crickets.

Poultry Notes.

Mrs. H. R. Hageman of Ontario claims that she has the champion egg layers of Southern California. She has 24 nine-months-old White Rock pullets that in one month laid 515 eggs.

Kentucky has long been noted for her celebrities. The latest is a hen which has laid 83 eggs in 83 days. Some of her celebrities have not done so well as that.

John D. Yates of Modesto is now setting 400 eggs daily, of white and brown Leghorn, to fill his small chick demand. He will keep his hatchery running till July 10.

T. D. Neilson of San Lorenzo has laid a hen egg on our desk that is a record breaker. It weighs a trifle over 4 1/2 ounces.

Mrs. Best's Letter.

SOME OF THE NEWEST THINGS SHOWN.

Dear Friends: Among the very newest things the shops are showing are the three-piece suits of silk for summer wear. They are simple in design and excellently adapted to large women. The coats are three-quarter length, full, and loosely belted. The long straight lines prevail. The deep V neck is finished by a flat small collar and flat reverses. The sleeves are medium in width, neither loose nor tight and end in a small flat cuff. The skirts are made medium full, gathered at the waist into a loose girdle of the same material. Some have two or three tucks of three-inch depth, others are stitched with silk, and still others are embroidered. The blouse is also simple; of the same color as the skirt and coat, but made of georgette crepe. The new square neck and V neck without softly flowing ruffles are shown, and some are still shown with the becoming large soft collar of white. Some of the skirts are elaborate, with gold or silver thread embroidery and these have the same bright note on the blouse half concealed under the georgette. Some of the blouses have the embroidery running around the blouse six inches up from the waist and then joined to the net or silk lining. Others have, by means of two straps of embroidery over the shoulders, an assimilated suspended effect. The sleeves are made full and without a lining. If they end in a cuff a bit of rose color is introduced there and a picot or hand rolled edged flounce drops gracefully over the hand. Most of these suits have been shown in dark blue taffeta with elaborate embroidery. The embroidery is about nine inches deep on the bottom of the coat and usually runs up the front and back of the skirt in panel effect or comes where the coat ends in a band. Pretty combinations of goods and colors have been shown too. Among them are tan satin and brown cloth, and grey cloth with blue silk.

Everywhere the long lined, loose dress is shown this spring. It comes in blue serge for street wear, in Jersey and sport silk for sports wear, and in taffeta and georgette for afternoon wear. The dress hangs from the shoulder and is loosely caught in at the waist by a girdle of the same material, or by one of the new girdles of large stones and metal filagree work. Some of these dresses are only slightly gathered on the shoulder and others have a yoke onto which the material is gathered or plaited. The sleeves are full and end in a snug cuff. The afternoon dresses are usually of tunic effect, some merely having a drop skirt, and others, when the tunic is opened at the sides like a mandarin coat, have an entire skirt. In pale blue and pink georgette crepe dresses the underskirt is usually heavily braided or plaited, or the tunic will hang flat and braided. Taffeta bands on the tunic and skirt help to give the dress more weight. The neck is finished in square or V shape by a braided band. A small flat collar appears in the back only. These dresses are very satisfactory, for they are light and dainty, pretty for afternoon and informal evening wear.

THE HOME CIRCLE

Over these dresses, of course, one must wear a coat, and there are many styles to choose from. The gay top coat of heavy material and prettily lined has been much advertised for motor wear. These come in Bolivia and Burella cloths in full flaring styles. Some swing from the shoulders and others have deep yokes. Most of them have big convertible collars, patch pockets and deep cuffs. They are very similar in style to the winter coats, but are shown in bright rose, blue, gold and green. There are some box-plaited models in three-quarter length to wear with separate skirts and street dresses. Dressy coats are shown in similar styles, but of silk, or silk and cloth combination. One dressy yet substantial coat that was different was of blue broadcloth and grey worsted. The main body of the coat and the sleeves were of blue but the worsted was applied in irregular style on the full flaring skirt. The shawl collar was of worsted as were the deep cuffs. The coat was belted loosely and had no pockets. Another pretty combination was of tan Jersey cloth, banded with blue taffeta. The coat hung loosely and had a flat blue collar and cuffs, blue belt, and deep band on the bottom. It was lined with blue too, and a blue sailor hat trimmed with tan ostrich tips was shown with it. All the coats are characterized by flaring on the bottom, large collars and cuffs, and braid trimmed pockets.

ROSABELLA BEST.

EGGS, AND HOW TO COOK THEM.

Egg Balls.—Boil eggs hard, cut in half, and take out the yolks, and mix with a few bread crumbs, chopped meat, melted butter, cream and salt and pepper. Mold into balls the size of an egg yolk. Put one in each half of the egg whites, set in a pan, and pour over them a teacup of cream. Sprinkle over some bits of butter, and brown in the oven.

Curried Eggs.—Mince a small onion very fine, and brown it in a tablespoonful of butter in a hot frying-pan. Mix a heaping teaspoonful of curry powder with a half cup of milk, pour into the pan and let it boil until thick; break the eggs in carefully and poach them in the mixture. Squeeze a little lemon juice over them before serving.

Poached Eggs with Cream Sauce.—Break fresh eggs into boiling water slightly salted. When set, remove from the water with a skimmer and pour over them the cream sauce: One teacup of sweet cream, a little chopped parsley, a tablespoonful of butter and a tablespoonful of flour mixed smoothly together, and salt and pepper to season. Boil three minutes and pour over the eggs.

Fricassee Eggs.—Boil a dozen eggs ten minutes. When cold, peel and slice. Season some grated bread crumbs with salt, pepper and nut-

meg, and beat the yolks of three raw eggs very light. Dust the eggs with flour, then dip into the beaten eggs, then into bread crumbs, covering well on both sides. Fry in hot lard.

Scalloped Eggs.—Break eight eggs into as many saucers, sift bread crumbs over each, dot with butter and season with pepper and salt. Fill the saucers with milk, bake till the eggs are set and serve hot.

Baked Eggs.—Separate the whites and yolks of six eggs, putting each yolk by itself in a cup. Add to the whites a saltspoonful of salt and a quarter of a saltspoonful of pepper; then beat them to a stiff froth, spread them on a buttered dish, and slip the yolks on top, laying them a little apart, and bake five minutes in a hot oven, or until they are a light brown. Dust pepper and salt over the top and serve hot.

Scrambled Eggs.—Melt one tablespoonful of butter in a saucepan. Beat four eggs light, and add a half teaspoon of salt and turn into the pan. Stir over a hot fire one minute and serve.

Fried Eggs with Pickles.—Put enough butter into a hot frying-pan to entirely cover the pan, break in as many eggs as it will hold, dust them with pepper and salt, cook to the required degree, and put them on a hot dish; meantime chop a large pickle fine and put it in the pan after the eggs have been taken up. Leave one minute, then put it on the eggs and serve at once.

Steamed Eggs.—Butter a dish and slide upon it six eggs broken as for poaching. Strew over them small pieces of butter. Set the dish over a pan of boiling water and turn another dish over it. In about four minutes the whites will be set, then sprinkle with salt and serve.

MARKING NAPERY.

Editor Home Circle: I wish to give a set of table linen as a wedding present, and would like information as to how it should be hemmed and marked.—Mrs. J. M. P., Soledad.

If you desire to, the cloth and napkins may be hemstitched, but the very fine linen from abroad is hemmed. The hem on the napkins is very narrow and that on the cloth not a great deal wider. Of course, you understand this is done by hand. The correct marking is the initial of the maiden name, as the wedding gifts are popularly supposed to be presented to the bride. On the cloth, the marking is placed so that when the cloth is in use the letter or letters are at the left of the person serving. The napkins should be marked so that when folded the initial will be in the center. In many cases there is a designated place on the pattern of the linen for the marking.

When meat soup is ordered for a convalescent, prepare it the day before and skim the fat off.

A UNIQUE AND DELICIOUS MARMALADE.

Peach and pineapple combined make a delicious preserve or marmalade. Use one-third shredded pineapple to two-thirds peaches, peeled and sliced, three-quarters pound of sugar to the pound of fruit, and cook carefully, with frequent stirring, until thickened and clear.

Good Health.

[By H. E. Pastor, M. D.]

Consumption and Climate.

About the first thing in the way of a remedial move that comes into the mind of a person who finds himself afflicted with tuberculosis is the question of climate. This matter—and it is important—has quite recently been touched upon by Assistant Surgeon General John W. Trask, U. S. Public Health Service, in one of his reports. Wild animals, he points out, are less prone to sickness than their fellows in captivity, usually housed in artificially heated buildings. Range cattle are freer from disease than those which are housed. And the indoor life in heated dwellings is no more favorable to man than to other animals.

Now, the climate best suited to the tuberculosis patient is the one which furnishes the most favorable conditions for outdoor life the greatest number of hours of the day, and the greatest number of days in the year. And while we are not writing this item with the intention of inviting an influx of one-lungers or no-lungers to California, we believe this State comes as nearly conforming to the requirements of this "best climate" definition as any other in the sisterhood of States. Its temperature is equable during most of the year, there is neither excess humidity nor excess aridity in the populated areas, the winds except for a few months in the late summer season are not violent, the atmosphere is clear, and the skies sunny. Dust and smoke—mechanical irritants—are not common. A thin pall of smoke and murk may sometimes cover the lower levels of our manufacturing cities, or a little dust on a windy day be encountered in the countryside; but such conditions are not common here.

It is not advisable as a rule for the victim of pulmonary tuberculosis to go away from home in quest of better climatic conditions. The unfortunate one can usually get the most climatic benefit by taking advantage of favorable weather conditions in his own locality. Sleep outdoors on a porch, if you have one, in ordinary weather, and in a room with open windows and doors when it is cold and stormy. The stay-at-home has better food, better care if under intelligent supervision, and is altogether more comfortable and safer than the one who goes to some distant place for the will-o'-the-wisp of a "better climate." So, unless the atmosphere of your home place is raw and cold for long stretches at a time, stay and make the best of climatic conditions where you are.

Health Jottings.

Asparagus induces perspiration.

Spinach is useful to those suffering from gravel.

Honey is wholesome, strengthening, cleansing, healing and nourishing, and the most digestible of sweets.

Tomatoes are a powerful cleanser for the liver, and a good remedy for indigestion.

Eggs contain a large amount of nutriment in a compact, quickly available form. Beaten up raw with sugar, they are useful for clearing and strengthening the voice. The beaten white of egg, with sugar and lemon juice added, relieves hoarseness.

THE SONG OF THE LONELY DUCKLING.

[By L. K. Hirschberg.]

Far across the meadow came a mournful little squeak.
I saw a little ball of fluff and little yellow beak.
A tiny duckling struggled thro' the grass that barred his way
And as I listened carefully I thought I heard him say—
Just a little water for my little beak to dabble in;
The other ducklings in the yard will not make room for me.
Just a little puddle for my little feet to paddle in,
Just a little pond for me.

I took my can of water and I made a little hole,
I filled it full of water-drops to please his little soul.
He dabbled, dabbled, paddled, spit-tered, spattered very gay.
And as I listened carefully I thought I heard him say—
Just a little water for my little beak to dabble in;
Nothing can be nicer than this hole so small and wee.
Just a little puddle for my little feet to paddle in,
Just a little pond for me.

THE STRONGEST THING IN THE WORLD.

This is quite a true story, and Christopher is a real boy. Although he has grown big now, I could take you to see him tomorrow if you wanted me to do so. Well, one cold, wintry morning, in a certain village, a woman opened her cottage door and found on the step a basket and in the basket a little baby boy. Somebody must have left him there; but although the cottage woman carried him indoors, she just couldn't keep him, because she had quite enough children of her own. So she took him to a house in the village where they looked after friendless little children, and there they took him in. All they could find out about his name was the word "Christopher," which was marked on his little night-shirt.

Christopher, of course, began to grow up, but the people who looked after him were not kind to him. He hadn't enough to eat and was pushed here and there. No one loved him as a father and mother would, so how could he grow up a nice boy? Sure enough, he didn't. Nobody would have him to work, because he would worry the pigs and let the sheep run out of the fields. He made all the children most awfully afraid of him. I know one little girl who used to burst out crying every time she saw him if she was alone. But don't say, "What a beast!" for Christopher didn't know how jolly it is to be nice. He had nobody to care about his being good, and it is dreadfully hard to be good when you've never had any one to love you and tuck you in at night.

Well, Christopher got worse and worse, and he couldn't get a smile from anybody. Even the best old man in the village said, "He's a bad fellow, Christopher; he'll never be cured." Christopher couldn't get any work and he couldn't get any money; but no one seemed sorry.

Yet there was a dear old lady near the village who had some cows, and she wanted somebody to bring them from the field each night and morning, to milk them, and to see that the shed was cleaned. So she said to somebody, "I wonder how that Christopher would do?"

That somebody replied: "Oh, don't take him! He'll kill the cows and ruin you. Why, nothing in the world could make him do anything or make him better."

Then the old lady said a queer thing. This is what she said:

"Well, I'm going to have him look after the cows, and I'll see if the strongest thing in the world will cure him."

She didn't say what the strongest thing was, and everybody thought that she was a silly old lady. But she took Christopher; and somehow the cows didn't die, and the cow-shed was kept clean. Nobody ever heard her scold Christopher. She got him a new suit of clothes, and she gave him five shillings a week, and nobody could find out that Christopher wasted the money in silly ways.

By and by Christopher, who had been the cheekiest boy you can think of, stopped being cheeky, the children coming home from school stopped being afraid of him, and his face became quite shiny and happy.

Then people went to the old lady and said, "How did you ever make Christopher so different?"

She said, "Oh, I tried the strongest thing in the world." Nobody could make her say anything more. This is really, really true.

Now guess what the strongest thing is. It changed Christopher; and if it could change Christopher, I am sure it could change the horriddest person you know. — Christian Commonwealth.

WHAT EVERY FARM SHOULD HAVE.

Every farm should have its buildings painted, as it adds immeasurably to the appearance of the place. Apart from this, painting is true economy, as it prevents decay.

Every farm should have trees, flowers and grass. In a land of flowers we should use them freely to add to the attractiveness of our farm homes and avenues of trees are a delight to all who behold.

Every farm should have a system of waterworks. Running water is one of the greatest of all boons, as a saver of labor.

Every farm should have a good lighting system. For convenience, cleanliness and simplicity, nothing is better than electric lights, but where these are not obtainable, acetylene lights are a good substitute. If compelled to use lamps, see that they are good and furnish a good light.

Every farm home should have good reading matter for the whole family. Books, papers and magazines are the connecting link between the farmer's family and the world at large. Have the supply as generous as the circumstances will permit.

SPELLING A COW'S MOO.

Some years ago, when Lucy was a little girl, learning to write, the teacher gave her this to copy: "M-o-o, moo."

"What is it?" asked Lucy, looking puzzled.

"That is 'Moo,' the noise a cow makes, Lucy."

Then Lucy began to copy "Moo." But she did it in a queer way. She made an M at the beginning of each line, and followed each M with a whole string of o's all across the slate, like this, Mooooo.

"But that isn't right, Lucy," said

the teacher, when the little girl showed her the slate. "You must copy the word as I have written it. So,—'Moo.'"

Lucy looked at the teacher's copy and then at her own attempts, and then she shook her head decidedly. "Well, I think mine is right, Miss Jones," she said; for I never saw a cow that gave such a short 'Moo' as you wrote down!" — Harper's Round Table.

The governor's wife was telling Bridget about her husband. "My husband, Bridget," she said proudly, "is the head of the State militia." "O'tought as much, ma'am," said Bridget, cheerfully. "Ain't he got th' foine malicious look?" — Southern Woman's Magazine.

SEASONAL HINTS ON FLOWERS.

Owing to the cold, late spring most plants in the garden are two or three weeks behind in their growth. Carnations that were planted out in March and early April should be pinched out. Get right down in the heart of the plants and pull it out. This will cause them to branch close to the ground. If they have run up a flower shoot, cut it off one inch from the ground, and they also will branch. They require water and cultivation while growing, and a rich mulch of half-rotted manure is very beneficial during the hot summer months. Asters are slow in getting started; also most of the tender annuals. It is not too late to plant out any of the above plants if you have neglected to do so.

Sweet peas are now coming into bloom and should have an abundance of water, both at the root and foliage; but do not let any flower go to seed. Roses are very backward this spring, and the conditions are just right for mildew and aphids. These you can prevent by timely attention.

The cause of mildew on roses is sudden changes of temperature, or they may be in a strong draught. An ideal location for roses is an open eastern exposure, where they are sheltered from strong winds, and are shaded from the hot afternoon sun.

You can from now on put in all the cuttings of chrysanthemums that you can procure. Put in cutting clear up to the end of June and they will make a nice flower on single stems, but will not grow tall and spindling like the early struck plants, and you can plant them closer together.

Bulbous stock that is through flowering should have all seed pods picked off, and encouraged to grow as much as possible. As soon as the tips of the foliage turn yellow cut them off within six inches of the ground and let the sun in to ripen the bulbs for next year's bloom.

To go back to sweet peas. While doing some repair work I stood a 12-inch plank against a row of sweet peas on the south side. It was there for about a week, and the part of the row where the board was, started into quick growth, and the vines are twice the size of the rest of the row. This shows that they require a mulch to keep the roots cool and moist. Leaves and lawn clippings make an ideal

mulch, or you can use straw, shavings and various other materials.

Put in coleus and all green-house cuttings from now on, and they will make nice plants for this summer. Ferns are in strong growth, and the foliage should be sprayed every day, and the atmosphere kept moist.

PLACES SERVICE ABOVE PROFIT.

"No man is a great newspaper man who makes a fortune out of journalism," declared Colonel Edward S. Wilson, editorial writer of the Ohio State Journal, in a talk before a class in journalism at the Ohio State university. "If he does his name is forgotten by posterity. Journalism is above money returns; it occupies the high altitude of human duty."

Touching on the field for women in the journalistic line, Colonel Wilson said he was of the opinion that the spiritual influence of women is what is needed in journalism today. "Intellect," he said, "is faulty and full of errors and cannot be trusted, but the spirit can."

"The main thing with an editor," he continued, "is his personality. If he is a true editor he will be a true man. He cannot make a good editor unless he has the Christian spirit. This personality should make itself felt in the editorial. How can you do this? Get down on the human plane. The only real intelligence conveyed is through the heart; you cannot instruct a man wholly from the intellect."

"Keep your temper. Don't get mad. When you write an angry editorial lay it aside for a few hours and you will not print it. I've done that a hundred times. Let a spirit of optimism prevail in the editorial columns. Avoid controversy. Nothing is ever settled by newspaper argument. It simply deepens the chasm between the two views."—American Press.

CARE OF SHOES.

The life and good looks of a shoe may be greatly prolonged by care. The use of shoe trees keeps the shoe in shape when not being worn and to a certain extent prevents the running over and general untidiness of appearance. If the heels are kept well straightened, the appearance of the whole shoe is improved. Nothing will get a shoe out of shape quite so quickly as to have the heels run down.

Patent leather shoes are less likely to crack if treated with vaseline occasionally. Tan shoes should be well polished before they are ever worn, to prevent spotting from water. Light tan shoes can be very much darkened by polishing with the darker tan polish at home, while the shoe stores will have them dyed if one so desires.

White shoes, whether cloth or buckskin, clean well with the preparations on the market and for white kid can be used benzine or gasoline with corn meal.

Two Irishmen were being drilled in marching tactics. One was new at the business, and his companion explained orders to him. "Now," said Mike, "when he says 'Halt!' you bring the foot that's on the ground to the side of the foot that's in the air and remain motionless." — Exchange.

Standards of Service

In rural communities clusters of mail delivery boxes at the crossroads evidence Uncle Sam's postal service. Here the neighbors trudge from their homes—perhaps a few yards, perhaps a quarter mile or so—for their mail.

Comprehensive as is the government postal system, still the service rendered by its mail carriers is necessarily restricted, as the country dweller knows.

Long before rural delivery was established the Bell System began to link up the farmhouse with the neighboring towns and

villages. One-fourth of the 10,000,000 telephones in the Bell System are rural. They reach more places than there are post offices. Along the highways and private lanes the telephone poles lead straight up to the farmer's door.

He need not stir from the cheerful hearth ablaze in winter, nor grope along dark roads at night for friendly news or aid in time of trouble. Right in the heart of his home is his telephone. It is the American farmer's key to the outside world, and in no other country is it found.

SAN FRANCISCO.

San Francisco, April 25, 1917.

WHEAT.

Open market trading in wheat so light during past week that it is very hard to furnish reliable quotations. Sellers still receiving scattered shipments, but offerings at the Merchants' Exchange, and on the street, are practically nil. Prices sharply higher, with not enough California Club and Northern Bluestem on hand to warrant quotations on these varieties. Preliminary reports from the Northwest indicate a good crop for the coming year, but also state that a good share of the output is already contracted by agents of foreign governments. Northern Red is bringing a top of \$4.35 per cental on small lots, but the highest quotable offering is five cents below this. Sonoma wheat, cleaned, \$4.00@4.25 Northern Club, 1.00@1.20 California Club, per ctn., None offered Northern Bluestem, None offered Northern Red, \$4.10@4.30

BARLEY.

Barley futures prices kept pace with the advance on spot offerings during the past week, with the December option especially firm. July options were ten cents higher than at the close of last week and spot feed barley is forty cents per cental higher as a result of the good shipping demand. A large number of interior points still report a feed shortage, and their call, added to the local demand, is rapidly forcing prices higher as available supplies are cleaned up. On last Monday several carload lots brought \$3 per cental; but it is only in lots of this size that this lower end of the quoted range can be secured. The future prospects are reported by buyers for local houses to be anything but rosy, and those who have been traveling through the dry-farming section say that the crop is beginning to head out already, despite the fact that the stalks are in many cases only a foot above the ground. They say that in most sections the crop is beyond the help of further rains.

Shipping, ctn., Nominal
Brewing, Nominal
Choice feed, ctn., \$2.00@3.15

OATS.

White feed oats advanced \$8 per ton this past week as the result of a cleaning up of supplies of red feed stock, and there is every indication to point toward still higher figures here. Local holdings are confined to small scattered lots, and dealers report that it would be impossible to fill an order for two carloads here without forcing prices still higher. Red feed, None offered
White, \$2.90@3.00

CORN.

Local stocks of milo were practically cleaned up here during the past week, and this situation was reflected in the higher quotations on Egyptian stock, which is now being held at \$3.90@4.00 per cental. Even high prices like these have failed to attract many offers. No Eastern stock has been either received here, or reported as on the way to this market.

(First-hand prices on strictly first-class grain, San Francisco.)
Eastern Yellow, ctn., bulk, Unsettled
California, sacked, \$3.15@3.20
Milo Maize, None offered
Egyptian, \$3.90@4.00

BEANS.

Three varieties of beans proved exceptions to the general rule during the past week, and failed to advance, but the rest of the list still climbs merrily. But what is of even more importance to the producer than this strong city market was the increase in prices offered to producers for contracts. Several contracts for limas at \$10.25, with immediate advances of fifteen per cent on the normal production of the producer who contracted, were reported. In Southern California 10½ cents was offered for 1917 limas; 7 cents for teparies; and offers of 9½@10½ cents on large and small whites were also noted in Central California. Pinks are being contracted at 8 and 9 cents; and 1,000 sacks of spot pinks from Sutter Basin recently brought 10 cents. As far as the producer is concerned, the market still rules everything in his favor; and there is no immediate need of his selling in order to realize handsome profits. Some brokers are sending out rumors that the government is to take full charge of the crop situation and set prices, but there is very little chance that the producer would be the one to suffer from such a move. As far as can be learned, none of the larger farmers have "fallen for" this scare-talk and contracted at the prices being offered by the brokers named. Figures just given out show that during 1916 \$1,344,745 worth of beans were imported into this country via the San Francisco custom house, as compared with \$1,852,567 the year before.

Bayos, per ctn., \$11.50@11.75
Blackeyes, 9.25@9.75
Cranberry beans, 11.50@12.00
Horse beans, 7.00@7.50
Small Whites (south), 14.00@15.00
Large Whites, 14.00@16.00
Pinks, 12.00@12.25
Limas (south, cleaned), 15.50@15.75
Red Kidney, 12.50@13.00
Mexican Reds, 11.00@11.50
Tepary beans, None offered
Garbanzos, 5.00@6.50

HAY.

Persistent efforts on the part of California dealers and farmers have had no apparent effect toward breaking the big shortage existing in this State, as receipts at San Francisco again showed a decline. Arrivals here last week were 1378 tons, as compared with 1589 tons the week before that and 1711 tons the week preceding that. Nearly 85 per cent of those came from Oregon and Washington; and such California hay as did come, was largely brought in on contracts. The larger dealers contract with big consumers for monthly deliveries of their seasonal orders, and do not draw the stock out of their up-country warehouses until it is needed for the contract fulfillment. All

THE MARKET REPORTS

Wild oats, 24.00@29.00
Barley, 27.00@30.00
Alfalfa, 24.00@27.00
Stock hay, 16.00@18.00
Straw, per bale, 1.00@1.25

FEEDSTUFFS.

Quotations on feedstuffs continue to advance merrily, with the steady demand cleaning out the holding of the lower priced offerings. Oil cake meal, coconut meal, tankage, and rice middlings joined the ranks of "none offering" in the local market, and there is every prospect that several other items will be in this list by next week. It is reported that a few scattered lots of oilcake meal are held in Oakland at \$58 per ton. Cracked corn tops the feedstuffs list at \$73 per ton; with alfalfa meal the cheapest at \$34 per ton.

(Per ton, San Francisco.)

Beet Pulp, per ton, None offered
Alfalfa meal, per ton, \$33.00@34.00

Old, 21@22c
Belgian Hares (live), 14@15c

BUTTER.

Butter quotations fell off this past week six cents per pound as a result of increased receipts here and a falling off in the demand from Eastern buyers. The New York and Chicago butter markets commenced to waver early last week, putting a practical halt to buying from that source here; and local prices were forced off by the piling up of current receipts. Seattle continues a buyer here, and the Alaska Packers Association is still in the market in a small way. The United States Government, which last week awarded contracts to local houses calling for \$80,000 pounds of butter, has increased this to \$80,000. The additional lot will be furnished by Monotti, Larimer & Solie at the same figure as was accepted on their bid for 150,000 pounds. This million pounds will be shipped from Eureka, the first lot of 40,000 pounds leaving Crescent City last week for the East, and will be all filled before the last of May. Present market indications point to easier prices.

EGGS.

Egg prices have followed the lead of the Eastern markets and there is every indication that further sharp declines can be expected. The speculative element, whose storage activities all over the country have been the main factor in holding egg quotations up of late, has apparently decided to let well enough alone; and markets have slumped under the influence of increased receipts. Storage holdings in San Francisco last week were approximately 56,000 cases, as compared with a total of 51,000 for the same time in 1916. When the differences in cost of this year's holdings and last year's is considered, the reason for the halting of speculative trading can readily be seen. Local conditions are practically unchanged from last week, but the sharp break in the New York and Chicago markets proved too much for local traders to overcome. For the next couple of weeks the Eastern market trend is going to govern California prices to a very large degree. Sonoma county egg production will be

10 per cent below normal due to reduction of flocks on account of high-priced feed.

Peaches, 1917, 7½@8½ c

BERRIES.

Prices on all varieties of strawberries broke noticeably during the past week, partly the result of increased offering but mainly the result of inferior quality. A large amount of moldy stock is being offered here now. Sonoma county berry crops estimated by F. B. Bill of the Sebastopol Berry Growers, Inc., are short due to poor cane growth on account of drought last year. Estimates are: Lawtons, 75 per cent normal; Logans, 85 per cent; and Mammoths, 90 per cent.

BUTTER.

Receipts of week ending April 24, 360,010
Receipts of past week, 280,050

There has been a sharp decline in this market since our last review. The surroundings of the market all favored lower prices, both East and West. The production in the Central West and East increasing under the influence of the more spring-like weather there and lower markets with better receipts here, caused buyers to put prices down. But at the lower range of values there was a very fair demand. The cold storage stocks also showed a slight increase compared with a year ago. San Francisco declined 5½c up to Monday and Chicago 3c and New York 3½c, while here California extra creamery sold down 6c. Still the market here is 8c higher than a year ago. But at this decline there was more buying on 'change than for some time, the packing house interest being in the market. The receipts for the week were 4,370 less than the week previous, but 70,960 more than the same week last year. Tuesday brought no change. The receipts were light, but Chicago was off 2c and New York 1½c and San Francisco unchanged; this had a bearish influence upon the market here. On 'change buyers held back and did nothing. California extra creamery, 33c

Receipts (railroads) for week ending April 24, 1917, 3,467 cases.
Receipts (railroads) for week ending April 24, 1916, 4,225 cases.

There were more in the past week and the demand was not so strong. While the consuming trade made fair purchases, and the cold storage people held back and bought more cautiously and sparingly. The cold storage holdings here now are 10,411 cases more than this time last year, which, with the improved receipts, encouraged buyers to bear down on prices. The receipts of fresh eggs by rail for the week were 3,467 cases and

Special Citrus Market Report

Los Angeles, April 24, 1917.

Shipments of citrus fruits from southern California from November 1 to April 22: Oranges 30,064 cars, and lemons 3,457 cars. Same time last year: Oranges 17,470 cars, and lemons 2,802 cars.

Shipments from central California from November 1 to April 20: Oranges 4,062 cars, and lemons 164 cars. Same time last year: Oranges 4,411 cars, and lemons 146 cars. The markets East the past week were interfered with by bad weather and wire troubles. Fancy fruit held steady, but all others were slow sale to a little lower. Receipts were pretty good and fair offerings were had of Florida and imported fruit. Lemons met with a poorer market than oranges. There are on hand and available for sale the next thirty days 41,000 boxes of foreign lemons against 121,000 boxes same date last season. Notwithstanding this shortage in foreign lemons, the market the past week was dull and lower.

Locally the market the past week was very quiet. All oranges were slow sale, even the large sizes that have been selling fairly well heretofore. Hence local packers were bidding a ¼@½c lower for oranges. Oranges were being bid for at

1¼@1½c per pound in the grove picked. Grapefruit unchanged at 2@2½c per pound in the grove picked, but very slow sale. Nothing doing in tangerines. Lemons dull and weak at 1@1½c per pound for the best in the grove picked. Culls have to be sold for what they will bring.

AUCTION SALES.

New York, April 23, 1917.

Fifty-one cars selling today. Market steady. Wires down and market report in consequence incomplete. There were 1,803 boxes of Florida Valencia sold at 95c to \$5.60, averaging \$2.75; 3,330 cases Spanish Valencia, repacked, sold at \$1.50 @2.70, averaged \$2.00. California navels averaged \$1.30@3.15. Lemons averaged \$1.00@2.50.

Boston, April 23, 1917.

Thirty-one cars sold. Market doing better on oranges and lemons. California navels averaged \$1.50@3.20. Lemons averaged \$1.60@3.50.

Philadelphia, April 23, 1917.

Seventeen cars sold. Market higher on oranges and lemons. California navels averaged \$1.30@2.60. Lemons averaged \$2.00@2.80.

HIGH PRICES FOR 1917 CROPS ASSURED.

From all the information at hand there will be an unprecedented demand for every variety of foodstuff that California can grow during the present season. Not only is the call for supplies practically unlimited, but our crops of grasses, grains, and fruits will be in all probability below normal owing to the unusually cold winter and the lateness of the growing season. Grain dealers are doing little business even now for want of supplies, and the spot crop of fruits of all kinds, dried and canned, is practically closed out. Prunes are steadily advancing and there is keen rivalry for the rag end of the raisin hold-over. The California Peach Growers' Association announced the withdrawal of certain grades of peaches, which have been sold out, and say that the entire 1916 pack will disappear within the next thirty days. Advance orders for the 1917 crop, confirmed at opening prices, are already piling up. It looks as though the California rancher will be in position to practically dictate the price of everything he grows this season, especially in the line of products peculiar to our State. It behooves him, therefore, to turn out and put in the best marketable shape possible every pound of California produce conditions permit. To this end he should be actuated not only by motives of self-interest, but by a spirit of high-minded patriotism. Go to it!

there were 2,000 cases of Petalumas in to go into cold storage. The market here declined 3/4c on extras up to Monday, 2c on case count and 1 1/2c on pullets. San Francisco for the same time declined 3/4c.

In Chicago the market broke 1 1/4c and in New York 1 1/4c up to Monday. Still the market here is 9c higher than this time last year. Tuesday, with light receipts and San Francisco sharply higher, the market was advanced 1c, but trading was light, as the Eastern markets were all lower.

Daily quotations:

POULTRY.
The continued high price of feed caused a flood of light broilers the past week and the market broke 7c under excessive supplies. Light hens declined 4c, heavy hens 2c and ducks 3 and 4c, and even at this reduction sales were slow. With the tourist now gone and only the home consumptive demand to depend upon, the market was the most quiet one for some time. Even at the low prices now prevailing, the masses are not using poultry to any great extent. Everything is slow sale. Fryers and turkeys, however, are unchanged.

We quote from growers:

Broilers, 1 1/4 to 2 lbs.	22@23c
Fryers, 2 1/2 to 3 lbs.	27c
Hens over 4 lbs.	21@22c
Hens under 4 lbs.	16@17c
Ducks	21c
Geese	15c
Roosters, 3 lbs. up (soft bones)	26c
Turkeys, heavy, 12 lbs. and up	29@30c
Turkeys, light	24@25c
Squabs, live, per doz.	\$1.50@3.00
Dressed	3.75@4.85

HAY.
The arrivals the past week were very light and under the light offerings a steady and firm market was had. But, as last week, the demand was mainly from the country and for horse hay. The dairy people continue to buy sparingly, using green alfalfa mostly. It is said the crop of new hay will be light and this to some extent offsets the want of a better demand than we have had the past two weeks.

We quote f. o. b. Los Angeles:

Barley hay, ton	\$21.00@23.00
Oat hay, ton	22.00@24.00
Alfalfa, northern, ton	20.00@22.00
Alfalfa, local, ton	22.00@23.00
Straw, ton	11.00@12.00

NEW VEGETABLES.
Prices of new vegetables held up fairly well the past week. Not enough in to break the market to any extent. Cab-

THE CALIFORNIA CURED FRUIT EXCHANGE

suspended business over a year ago and has since been in litigation with its alleged defaulting cashier, L. O. Walker. The litigation has closed with an agreement out of court which permits them to bring action against Walker in case it shall develop within five years that he now has property or that he conveyed property without sufficient consideration during the investigation. All suits are dismissed and all that remains is for the Exchange to sell its big modernly equipped packing house in Berkeley. Walker's \$2,000 bank account will apply on notes held by a bank against the Exchange.

bage is coming in slowly and in good demand. Asparagus also sold a little better. New onions are coming in more freely and are a little lower. Demand fair. New potatoes were in better supply, but as the quality showed improvement prices were kept up. Peas are coming in freely; slow sale and cheap.

We quote from growers:

Cabbage, per cwt.	\$4.75@5.00
Local and Northern, per lb.	7@8c
Imperial Valley	5@6c
New potatoes, per lb.	7@8c
Peas, per lb.	3 1/2@4 1/2c
New onions, silver skins and Bermuda, per lb.	7 1/2@8c

BEANS.
The advance of last week is still being maintained, and a very fair demand continues to be had from the country for all kinds of beans. As stocks are light, there is a feeling in the trade that they will all be wanted before seeding is over. The consuming trade, however, is taking very few beans at present high prices.

We quote from growers:

Limas	16c
Large white	16c
Small white	16c
Pinks	12 1/2c
Blackeyes	10c
Tepary	12c

BERRIES.
The strawberry season is now fully opened and receipts are coming in quite freely and the quality steadily improving. With increased receipts prices are working lower, but this puts them in the reach of more consumers and a more active demand is being had. A few blackberries were in during the week, but they were high and slow sale.

We quote from growers:

Strawberries, poor to choice, per 30 basket crate	\$1.35@1.50
Fancy, per 30 basket crate	1.75@2.00
Blackberries, per 30 basket crate	5.00

HONEY.
There is nothing new to note from a week ago. Still no extracting is being done in southern California. The cloudy cold weather has kept the bees from accumulating any honey. In some localities it is said that beekeepers are still feeding sugar, the bees not getting enough honey to keep them going. Hence we are unable to give quotations. But as the crop will be short, prices necessarily will be higher than last year.

Department A-13
433 California Street, San Francisco

Special Livestock Market Report

San Francisco, April 25, 1917.

CATTLE.—More grass cattle are arriving than slaughterers can comfortably handle; though prices are not yet marked down. Reports from our field men show increased stock in Kern, Tulare, and Kings counties and all in pretty good condition; Pt. Reyes, Marin County, shipping about 50 dairy calves per day to this market on account of short feed; Shasta County livestock conditions under normal and range feed poor due to lack of fall rains; Stanislaus cattle in fair condition considering cold spring and many not likely to be in good condition when shipped; pasture very poor in the San Joaquin Valley and southern Coast counties and east side of Sacramento Valley. The U. S. Dept. of Agr. reports cattle in California to be in 96 per cent condition, which is the average of the past ten years. For U. S. they are in 94.4 per cent condition as compared with 95.2 average of ten years.

Grass Cattle—

Steers, No. 1	9 @9 1/4c
No. 2	8 1/2 @8 3/4c
Cows and Heifers	7 1/2 @7 1/4c
No. 2	6 1/2 @7c
Bulls and Stags	6 @6c
Calves, light	8c
Medium	8 1/2 @8 1/2c
Heavy	7 @8c

HOGS.—Freely offered, quite a few soft hogs, principally from corn feed. These are getting 2 to 2 1/2 cents less than the prices for hard, grain-fed stock. U. S. Dept. of Agr. reports condition of California hogs April 1 at 96 per cent as against 97 per cent for a 10-year average. Only 97 per cent as many breeding sows are on hand as on April 1, 1916. The report for U. S. is 95 per cent condition as compared with 93.8 per cent 10-year average, and 97.1 per cent as many breeding sows as a year ago. Kings County report shows very large number hogs all in good condition. Kern-Tulare report indicates great increase in all livestock the past 12 months, but the increase is greatest in hogs.

(Rough docked 10 and 20 pounds; piggy sows, 20 to 40 pounds.)

100 to 150 lbs.	12c
150 to 300 lbs.	14 1/4 @14 1/2c
300 to 375 lbs.	13 1/2 @14c

SHEEP.—Lambs are marked down slightly from high prices previously prevailing, and yearling lambs are now quoted at the same price as milk lambs—an unusual condition. It is due to the valuable wool on the yearlings. The Government report indicates California sheep condition April 1st 95 per cent of normal as compared with 97 per cent for a 10-year average. Corresponding figures for U. S. are 93.8 per cent and 95.5 per cent. Lambs lost in California from disease and exposure are placed at 85 per 1000 head, as compared with a six-year average of 69. For U. S., the figures are 60.3 and 58.6, showing California in much worse position than U. S. as a whole. An eastern paper is quoted as saying that there are 13,000,000 fewer sheep

in U. S. than there were in 1900.

Prime Wethers	11 1/2 @12c
Ewes	10 @10 1/4c
Milk Lambs	12 @12 1/2c
Yearling Lambs	12 @12 1/2c

WOOL.—The Government has signified its intention to take over the product of three northwestern mills. Everybody is working in the dark so far as the foreign situation is concerned, and there is no change from last week's quotations.

HIDES.—No important movement noted and no change.

Los Angeles, April 24, 1917.

CATTLE.—While there was no quotable change in the market the past week, its tone was hardly so firm. Most of the offerings were fed steers and in very good condition, but as there has been a falling off in the demand for beef resulting from high prices and the high cost of living all round, killers were less anxious for supplies, while the scarcity and high price of feed made country holders more willing to sell and meet buyers' views. California and Arizona furnished what cattle coming in and as a rule the arrivals were in very good condition. As feed is high and scarce, the later supply of good cattle, it is thought, will show a falling off. Calves continue to arrive freely and under the liberal offerings the market showed a decline of 25@50c per cwt.

Per cwt. f. o. b. Los Angeles:

Beef steers, 1000 to 1100 lbs.	\$9.50@10.00
Prime cows and heifers	7.50@8.00
Good cows and heifers	7.00@7.50
Calves	8.50@9.25

HOGS.—A fair demand was had for what hogs coming in the past week. The arrivals, however, were only moderate and most of the receipts were made up of light weights and showed that they had been forced to market to save feed. Choice packings hogs were scarce and killers were bidding \$1.00 per cwt. over quotations for what few coming in. A small lot of grain-fed purebred Berkshires averaging 170 pounds were sold during the week at \$14.50 per cwt. What hogs arriving were from California and Arizona; Idaho hogs still being drawn east by the high prices there.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 250@300 lbs.	\$11.50@12.00
Mixed, 200@250 lbs.	12.00@13.00
Light, 175@200 lbs.	12.00@13.00

Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.
SHEEP.—The market the past week was much the same as the week before. May be a little more quiet. The heavy hotel demand had during the tourist season being lost and the home trade buying sparingly at the high prices, showed itself during the week in the market, which was quiet. Prices, however, were unchanged, as the offerings were not heavy.

Per cwt. f. o. b. Los Angeles:

Prime wethers	\$9.00@10.00
Prime ewes	9.50@10.00
Yearlings	10.50@11.00
Lambs	13.00@14.00

BEEKEEPERS' OPPORTUNITY.

The United States needs tons and tons of honey. The Secretary of Agriculture says "only 20 per cent of the supply of sugar normally consumed in the United States is produced domestically. Unless normal imports of sugar reach our shores, therefore, a shortage of this food is inevitable." Practically all of the unusually large honey crop of last year has been sold at good prices; and in the face of the probable shortage of sugar there can be no fear of overproduction. It is the patriotic duty, therefore, of every beekeeper to take immediate steps to increase the present year's production.

Here are a few ways in which you can help to do this: If your bees are in box hives, get modern hives and adopt modern methods. Prevent natural swarming as much as possible and make increase by artificial division. Give your colonies plenty of room for storage, as gathering nectar often ceases when the bees are overcrowded. Give your bees extra attention and look for first signs of disease, treating all suspected colonies at once to prevent spread of disease. Notify your county bee inspector at once in case disease breaks out in your neighborhood.

This is a good time for the professional beekeeper to start out- apiaries, being careful, however, to not overstock the range. To those contemplating beekeeping, either as a side line or professionally, we would say "go to it." You will probably never find a better time, and you are helping to "win for democracy."

Rugged, Hardy Work Wagons

These Overlands are as keen for the work of farm hauling as for the constant hard usage in commercial delivery work.

The Overland 1200 pound Delivery Wagon is built on the reliable time tested 35 horsepower chassis that made Overland famous the world over.

It is electrically equipped for lighting and starting and has every convenience.

The body is big and has capacity for larger bulk freight as well as 1200 pounds of weight.

It is a comfortable easy riding car as well and may be had with two *extra three-passenger removable seats for fifteen dollars additional if desired.* With these extra seats

you have a comfortable eight passenger car.

It is a great money maker and time saver on any farm.

At the price \$850 it is exceptional value for it shares proportionately in the economies of our vast production of the most comprehensive line of motor cars ever built by any one producer.

The smaller cars either panel or express type are exceptional values and equally sturdy and reliable for lighter farm hauling.

See the nearest Willys-Overland dealer at once and have him show you these wagons and the beautiful new line of passenger cars.

THE PACIFIC RURAL PRESS

SAN FRANCISCO

MAY 5, 1917.

LOS ANGELES

How 150 City Boys Furnish Fruit Harvest Labor

[Written for Pacific Rural Press]

WHY produce food if we can't harvest it? The labor shortage for farming is about as serious as the food shortage. State Horticultural Commissioner G. H. Hecke says ranch labor is sure to be short. Prof. W. T. Clarke of the University of California says 20,000 ranch laborers are needed at this moment. President F. B. McKevitt of the California Fruit Distributors says fruit growers must get more labor at less cost or the crops will rot. Dean T. F. Hunt of the College of Agriculture says that, assuming a three-year war, 200,000 people now in the cities of California will be required on the farms. M. J. Moniz of Sebastopol says that berry growers are already trying to engage help for picking.

Men must do the sterner tasks of the war and the heavier work in agriculture. There will be a great vacancy in fruit harvest and packing, to be filled by women and children. School vacations must be extended. Work of city school children and women must be organized to save the fruit harvests and release men for the heavier work. Representatives of thirty-two agricultural colleges and commissions recently recommended the mobilization of more than 2,000,000 unemployed boys between 15 and 19 years for farm and munitions work.

BOYS' SOCIETY PICKS BERRIES THIRTEEN YEARS ON ONE RANCH.

That 75 to 150 city boys have returned to the same ranch year after year for about three months of berry and fruit picking, proves that similar projects can be organized to give city boys all over the State magnificent vacations, keep them out of the criminal courts, supply them with bank accounts and a reserve of good health, and ingrain strong moral and patriotic impulses in their characters.

In San Francisco is an institution, now forty-two years old, which was founded by "believers in boys for the purpose of giving them a better chance." It is non-sectarian and is supported entirely by volunteer contributions of those who believe in boys. Last year there were 358 of them in the Home provided by this "Boys' and Girls' Aid Society." Of these, 114 were committed to the Home by juvenile courts of thirteen counties of central California. Only boys can be cared for, due to financial reasons, and these range from 7 to 18 years old. Fifteen of the older boys have already enlisted in the army and navy since war was declared, due largely to the patriotic training received in the Aid Society school and the camp.

In the berry district of Sonoma county is a great-hearted woman, Mrs. Laura E. Barlow, who in 1903 had

Camp Perkins, where 150 Berry Picking Boys Camp All Summer.

100 acres of berries and the courage to co-operate with the Aid Society in using the boys to pick the fruit. It has resulted to her benefit as well as to the health and prosperity of an untold number of boys in the years since then.

That summer 75 boys from the Aid Society picked fruit for her. In 1904 and 1905 practically all of the boys from the school spent the summer there.

In 1906 it was seen to be no longer an experiment. Geo. C. Turner became superintendent of the institution that year. With Mrs. Barlow, he planned a permanent camp on her ranch, with wooden platforms for removable tents, a kitchen, store-room, sick-room, and with sanitary equipment such that when, later, the State law enforced sanitation

in rural workers' camps the State inspector pronounced this the best he had seen.

About 150 boys now annually spend three months there; and they are already this spring eager to go. They pick 250 to 300 tons of berries per year, nearly 10 per cent of the district's crop. They earned last summer between \$4,000 and \$5,000, being the best paid berry pickers and having helped with the prunes and in the canneries, etc., not confining their work to the Barlow ranch. They retained three-fifths of this money; two-fifths is retained by the society to pay expenses, including athletic equipment and Fourth of July fireworks, as well as food, supervision, etc. They were paid four cents per five-pound tray for picking cannery berries, thirty cents per twenty-two-pound crate for shipping berries, eight cents per tray for raspberries, and seven cents per lug box for about 200 tons of prunes.

COSTS \$8.35 PER MONTH PER BOY.

Food for the 150 boys costs the management about \$800 per month, or

\$5.35 per boy. The minimum necessary help has been found to include a general superintendent, cook, supervisor for each fifty boys, a woman for the dining "room" and one for the mending. These should be obtainable for, say \$450 per month, or \$3 per boy. At this rate the cost for 150 boys three months is about \$3,750. Since the boys earn about \$4,500, their vacations have yielded well above expenses and they have had a magnificent time. The expenses noted are based on hiring all help. They would be much less if mothers, relatives, teachers, etc., should volunteer their services and share that delightful camp.

CALIFORNIA WAR PRIZES.

WE WRITE agriculturally as we ask our readers to think of what California has already gained by the war. It occurs to us that if the thousands who are now rushing to anticipate conscription with volition should never have to do more than wave a flag; if the stately war-craft now patrolling the Golden Gate should never fire a gun except in friendly salute to allied ships—even if a back-yard cabbage should never come to a head, California has already achieved great, fundamental agricultural gains by the attitude of her citizens toward the war. Of course we believe that all the world will come to be clearer in head and stronger in heart by the lancing of the autocratic fistula of central Europe, painful though the operation be—but we are not licensed to report upon that phase of the world trouble. Agriculturally the world is coming to be better off already through its new attitude toward its farming population, as we noted last week, and California is making great gains, not only in this general way, but in specific transactions which will have direct and potent influence in the development of the State and in the fairer foundations for the prosperity of its citizens. We refer of course to the crystallization of public opinion in specific transactions by the State Legislature which finished its seasonal work since the date of our last issue. This year's Legislature might have done more, it is true, because it left liquor evils uncorrected, but it really did notable things and was helped to the force of its doing, if not to the achievements themselves, by the strong awakening of the public mind to principles involved in these transactions by the wide conviction that the application of these principles is essential to public safety and efficiency in the building of a stronger commonwealth.

OUR GAIN IN PRODUCE MARKETING.

PERHAPS California's greatest gain, for immediate and permanent advantage to our food producing industries, was the enactment into State law of the principles of fair returns to producers for which Harris Weinstock so resolutely contended. It is true, perhaps, that he brought them into the lime light by a kind of personal initiative which the legalized "initiative" does not cover, but the "referendum" which he invoked to approve them was so irresistible and indisputable in its verdict that no personal impeachment of him or his motives was possible. His attitude and methods were perhaps modified somewhat by conference with those who were striving in different ways for the fundamental principles of producers' co-operation which he desired to enforce, but these modifications were a form of endorsement—a critical endorsement which every just man contending for the truth gains strength from. Col. Weinstock was not contending for personal advantage, for he, as we understand it, actually legislated himself out of office, and has to be recalled to service, if the Governor so desires. It seems to us very important that it should

be generally understood that Col. Weinstock is not in this business for office or income but for the enforcement of principles which he conceives to be patriotic, philanthropic and economically just to all his fellow citizens. We never saw the inside of his sack, but we believe that it contains something more negotiable than back-yard garden truck, and he is therefore free to contend for principles wholly apart from self-service through their advocacy. The general recognition of this fact is demonstrated by the popular support and the legislative endorsement which his contention has received. The new law, which is now in the Governor's hands, sweeps away the impossibilities and fallacies of the law of 1915 and prescribes a practicable and desirable line of duties, authorizations and volitions which are outlined in the act as follows:

To act as advisor to producers and distributors when requested; to gather and disseminate impartial information concerning supply, demand, prevailing prices and commercial movements, including common and cold storage of food products; to encourage the organization of co-operative associations among producers, distributors and consumers; to encourage standardization of California food products; to act as mediator, when invited, in controversies between producers and distributors; to extend the market for California products throughout the world. Advisory powers are assigned the State Market Director in carrying out many of these provisions. It also provides that the director is to engage in no other line of business during his term of office.

This is surely a line of regulatory, promotive and judicial work which can be turned to great advantage in reaching fair solution of California marketing problems. It fills what has always been lacking, a central hortative and executive authority possessing powers traditionally declared to be non-existent, for it will be at least morally powerful, not only to lead producers and consumers to the co-operation trough, but to make them drink. Recognition of the desirability of such powerful service by the State was doubtless sharpened by the war-attitude toward food distribution which has recently so strongly impressed itself upon the public mind. Whatever food regulation, if any, may be necessitated during the coming months, California will be fitted to intelligently undertake through the wisdom which the Market Director is commanded to secure, and the fairness of it to producers will be assured by the points of view which the Director has gained by his experience and by the public spirit and interest which have been so clearly recognized as actuating his undertakings.

CALIFORNIA COLONIZATION SYSTEM.

ANOTHER progressive affair, which the current interest in stalwart and enduring preparedness helped to put over, is the first act of a drama of State help for responsible and economic development, through a system of expertly directed, inspected and endowed colonization of qualified young farmers on subdivisions of selected land. Our readers have knowledge of the facts and experiences upon which the undertaking proceeds, for they have been set forth at considerable length in these columns during the last few months and an outline of the essential points of principle and method was given on page 532 of our last issue. Though others have participated in getting the thing into shape, the chief conceptions and convictions involved in it are the fruit of much meditation and open-eyed globe-trotting by Dr. Elwood Mead of the University of California and so much of it as will be immediately entered upon, will constitute laboratory work for a visible demonstration by his division of Rural Institutions of the University. While this demonstration is being sought, all doubting silurians of the individualistic school are expected either to learn to sit up and take notice or creep quietly under the sod, as they see fit. When results reach an end which will place an operative crown upon the work, it is expected that the State may adopt the system for good and all and private enterprises in land settlement will embody the same policies in their work—but this the future will determine. In case readers may not easily recall the features of the effort, the following rough outline may sufficiently indicate them:

The State will embark in an entirely new enterprise by which it is hoped to encourage the settlement of small, improved farms by qualified persons of moderate means. The administration of the act is to be carried out by an unsalaried board of five members and an appropriation of \$260,000 will be placed at the disposal of the board to purchase 10,000 acres of unimproved lands selected for good farming quality. The board is authorized to make necessary improvements and to subdivide the tracts and sell them to selected settlers, on loans with amortizing payments extending over a period not to exceed forty years, and with the right to repay the loan any time after five years. Unless the applicant is prepared to pay half the purchase price of his allotment, he would be required to apply to the Federal Farm Loan bank at Berkeley for 50 per cent of the appraised value of the land and 20 per cent of the value of the improvements, and the State will lend him additional money for his outfit, as he may require. The \$260,000 advanced by the State is calculated to be returned within fifty years, with interest at the rate of 4 per cent.

Aside from the arrangements by which all repayments and interest go to the State, as indicated in the last sentence above, the State has additional security for its money by the increased value of the land which its handling of it will create. In the case of the University Farm at Davis, the State has made not less than \$100,000 on the current value of the land since its purchase in 1906, wholly apart from the cost of the improvements it has made.

SAFEGUARDED BY SELECTION.

THE REAL security of the State's investment in land for subdivision rests upon the principle of selection, which is applied all through the operation of the act. The land is to be selected by the expert board for its quality and suitability to make good, profitable, small farms. It is not a scheme to gamble in poor land. Then the people who will be given the chance on such land will also be selected people—not anyone who has a farming dream and money enough to make a "first payment." The law says that the board shall have the right to reject all applications and it also says: "No applicant shall be approved who shall not satisfy the board as to his or her fitness successfully to cultivate and develop the allotment applied for." In the bill as originally drawn it was provided that applicants must be "between the ages of 21 and 35 years," but the Legislature struck out this limitation—probably in recognition of the fact that a Californian never knows that he is more than thirty-five. We presume, however, that the board will prefer young people as much as it likes and we shall not blame them. We quite agree with A. W. Foster, who has himself maintained a youthful spirit all through his long course of advancement from president of a railroad to field-marshal of a chicken ranch. Mr. Foster wrote the other day:

You cannot breed a race of farmers offhand. You cannot take middle-aged men or the broken-down wrecks of cities and make successful farmers of them. Youth is the essential of the raw product. More than in any other walk of life, the work must begin while body and mind are still in the formative state—the mind open to quick perceptions and the body able to gain the necessary robustness. Given that, I know of no other occupation that holds out a surer way to a satisfactory future. But it takes time to breed capable farmers.

And in connection with this State enterprise for land settlement, it must be remembered that it is a University undertaking and the University relieves itself of old men by asking Mr. Carnegie to pay their board. The great strength of the University lies in its faith in young men and women, jointly and severally. They are the ones who will get the State farms by showing that they deserve them!

GET BUSY ABOUT LABOR.

WE TRIED to write urgently last week to fruit growers to get busy individually and in organizations to secure their labor supply and if it was not in sight to get still more busy in digging it up. The same exhortation is now addressed to all farm producers, for it is becoming more evident that if a supply is to be had it must be dug up. From southern California an appeal is going to Washington to do some-

thing to offset the exclusion of Mexicans which the new law which went into effect this week seems to practically accomplish. They are not excluded as are Hindus and South Sea islanders, but their entrance calls for \$8 per head instead of \$4, as formerly, and a Mexican peon with \$8 would be an international curiosity. Probably the literacy test will also sharply reduce the supply, for that provides that all aliens over sixteen years of age who cannot read the English language or some other language, will be excluded from the United States. Presumably an employer might ante up \$8 per man at the border, but it will take pretty rapid work to make him read anything over night. It really looks as though in a war emergency the immigration lid was screwed on a little too tight. What can be done with seven-fold increase of the cotton area in the Imperial Valley district and the southern negro pickers held back by a similar demand at home? And there are other southern Califor-

nia labor requirements which are also acute. In central European countries farm laborers are given permits to enter for limited working periods and are hunted out again after harvest. These countries are handier at police work than we are, but there may be some way to manage it to get the labor which will be the measure of our production.

In the San Francisco district there is some prospect for a city contribution, for the county defense committee is arranging a house-to-house canvass of San Francisco for farm labor, the pledging of idle men to farm work, and will make an attempt to secure from the Board of Education the extension of vacations that will enable older boys to work in the country. We do not know the answers to these questions we are raising, but we do know that every crop community or organization of farmers ought to get very busy about its labor supply.

the great, great grandchildren of the generation you started in with. We are not sure that it is possible to catch up with the cabbage aphid after it has got a good start. The way is not to let it get such a start.

Corn for Silage.

To the Editor: I have very moist river-bottom lowland, and contemplate planting Indian corn for silage. What variety should I use and should it be planted as we generally plant corn for other purposes?—H. B., Burrel.

Tall growing dent varieties are chosen for silage. The greatest grower according to local observation is best, but if none such has been demonstrated or available, you can order of the seedsmen advertising in our columns, for they all make a specialty of furnishing good silage varieties. A little more seed is used per acre—say about one quarter more—and the corn is grown in rows 3½ feet apart, with plants eight or ten inches apart, instead of in hills. Just as good cultivation should be given as for grain, for full development of size and nutritiveness in the plant is desirable.

Make a Bermuda Lawn.

To the Editor: What can I do to kill wire grass? It gets in the lawn and it is impossible to keep it out.—M. R. O., Modesto.

If one has a blue grass lawn upon which he is willing to spend all the time and money necessary to root out intruders, wire grass (by which we suppose you mean Bermuda) can be continually kept down so as not to be noticeable, but we know of no easy killing method. For ordinary house-lawn purposes, in a hot valley, we would not try to kill a friend who will stick as close as Bermuda. Rake off all the top-growth when the frost kills it. Rake it clean or pare off the whole surface flat and smooth with a sharp spade. Do this every winter and you will have a new velvety lawn every summer. Mow it and give it a good watering about once a month and praise the Lord every day that he made it so easy for you.

Testing Land for Alfalfa.

To the Editor: I have forty-five acres of irrigated sandy land in Merced county, in which for the last five years I have raised beans; now the land is sowed to barley. I want to put it in alfalfa, but before doing so I would like to be sure that the land is good to raise alfalfa. Please tell me how to test the land and name some competent party to advise me.—Owner, San Francisco.

Messrs. Barley and Beans are among the very best soil experts practicing in California. Mr. Barley makes a specialty of rainy season investigation, and Mr. Beans is a famous authority on summer conditions. If they have worked on your place for five years without taking all your money away from you for expert fees, you can depend upon it that your land is good for alfalfa, and for almost everything else. Alfalfa is not a prig. All he demands is fairly good, deep land and decent farming.

Transplanting Beets.

To the Editor: After having transplanted beets and mangels I noticed that the majority of these plants turned prematurely to seed. What would you suggest as in regard to a preventive?—E. H., Alameda.

Fleshy rooted plants are always more apt than fibrous rooted plants to be thrown out of step by transplanting. By the set-back the biennials think they have reached the second season's growth and go to seed instead of making larger roots. The preventive is to transplant earlier, that is when the plants are smaller, and to lift them with a trowel so that they do not lose their laterals, as they do by pulling out of the soil.

California Weather Record

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., May 1, 1917:

Stations—	Past Week.	Rainfall Data.		Temperature	
		Seasonal To Date.	Normal To Date.	Max'm.	Min'm.
Eureka	30.22	22.55	56	42
Red Bluff	17.00	23.31	82	43
Sacramento	12.81	19.01	82	46
San Francisco	15.72	21.33	74	46
San Jose	12.40	16.06	78	42
Fresno16	7.06	8.95	86	48
San Luis Obispo	22.54	19.60	84	42
Los Angeles04	15.02	15.12	68	46
San Diego04	9.78	9.60	62	52

Give Full Name
and Address

Ways With Beans.

To the Editor: As I wish to plant about 11 acres of pink beans this year and am inexperienced, will you answer the following questions in your paper: Number of pounds of seed to acre? Time to plant? How often to irrigate and cultivate? I have heard that if planted too early there will develop flies or worms in beans at harvest. Is this so? If irrigated at wrong time, I have heard the blossoms or small pods will fall off. How about it?—U. F. A., Richfield.

If you wish to plant pink beans on ground that is apt to be rather dry, drop the seeds about eight inches apart in rows three feet apart—which will take from 15 to 20 pounds of seed. On moist ground, drop at six inches in rows 30 inches apart, which may take from 25 to 30 pounds of seed. On dry land not to be irrigated, plant immediately, for it is now getting late. On moist or irrigated land, beans can be planted through May and into June, and later planting is preferred on such land in the interior valleys because there is less danger of the blossoms blasting in hot dry winds. Cultivate often enough to keep the surface mellow. Irrigate sufficiently to keep the plants growing well until the pods are set—if it takes all summer. The number of times depends upon the soil and how it holds the water for the plant. After the pods are formed, be careful not to irrigate too much nor too late. Late planting does often reduce weevil injury by bringing pods after the mother insect has finished egg laying, but under dry conditions if you figure too much on getting no pods for the bug you may not get any for yourself, and the same policy on moist land may get your crop into fall rain or frost. It is safer not to irrigate during bloom and setting. Previously applied moisture should be enough to carry the plant through this period. Therefore, be sure to get enough beforehand, either natural or by irrigation, for late irrigation on plants which have become too dry serves no good purpose and is apt to start a second growth on plants which should be maturing. If the plant is still growing well this is much less likely to occur.

Dangerous to Peach Trees.

To the Editor: I am thinking of sowing alfalfa between my peach trees. Can the trees stand as much water without injury as the alfalfa would require? I would like to check the ground off in larger checks than one row wide, which would leave some of the trees standing in the water when irrigating. The soil is rather heavy.—Subscriber, Wheatland.

On a deep, light loam the water might distribute itself fast enough to save the trees from injury. On a heavy soil the chances are that the trees would soon be drowned out unless you were very careful to irrigate very lightly and just frequently enough to keep the soil in the right condition of moisture. The best results with alfalfa would probably require on the average two or three times as much water as the best results with peaches.

Frost Injuries to Peach Twigs.

To the Editor: I have Tuscan cling peach trees four years old, which had a heavy setting of blooms but later on nearly all fell off and the leaves which started out were small. In some cases only half of the tree is affected and the other half has a good crop of fruit. Now, alongside of the affected fruit spurs there are coming new, healthy shoots. The affected fruit wood does not seem to have any life in it and upon close observation one can see small brown raised places on the bark of the fruit wood. I am sending some of the affected twigs.—Subscriber, Live Oak.

There are no signs of disease on the bark acute enough to explain the behavior of the trees. This behavior is covered by the discussion by Prof. Smith on the first page of our issue of April 21; particularly the effects of low temperatures in the latter part of that article. Parts of the tree being differently affected is probably due to different exposures to frost and chill and to different conditions of sap flow. This may affect whole branches or it may be manifested by twig injury all over the tree. Theoretically, the habit of a tree to start top buds first is due to concentration of sap and greatest pressure toward the ends of twigs. This condition also invites greatest injury by frost and gives us twig killing, while good shoots will start from uninjured parts below. If the chill does not amount to killing there may be a weak start of small leaves, as is shown by your specimens. Where it is practicable, it is desirable to cut back weak growth to points where good shoots promise strong growth of new wood. Branches which give only a few small leaves instead of good lateral shoots are apt to die-back later.

Kerosene Emulsion and Cabbage Lice.

To the Editor: I followed the department's formula for making the kerosene-soap emulsion, but the result was not to my idea of what it should be. It separated into two parts—a thick white curd and a milky liquid with a kerosene-blue shade. I strained and used this on my cabbage for green aphids, with no results the first or second application. Do you think it an improper solution, or should I use it oftener?—Subscriber, Walnut Creek.

Probably you did not pound the stuff enough to get a good emulsion. This may be done by churning, by revolving agitators, as in an egg beater, or by pumping the stuff back into itself with nozzle and force pump. The last is the commonest way. When the agitation is adequate practically the whole of the mess changes form and becomes like clabbered milk, and this is added to the ten or more times its bulk of water, according to the strength you desire to use. One to 20 is strong enough for plant lice. The essential is not in strength, but in getting the dope on the bug. What you strained out of your mixture would kill it—in fact everything in the formula would kill the bug if applied with sufficient force. Even the water would do that for an aphid. The dilution is not for the sake of the bug, but to save the plant from injury. Hitting the cabbage aphid is no easy job and you must keep at it until you get

Deep Cultivated Layer Saves Moisture.

[Written for Pacific Rural Press.]

In all the conservation talk now being buzzed, no element is of more importance than conservation of the scant water which has fallen. On dry-farmed land, the Eastern "dust mulch" of two inches is entirely inadequate for our long hot dry season. A minimum cultivated layer of four to six inches will be found most economical from the water standpoint. This layer with all its moisture and plant food must be lost to the roots of trees and plants. Therefore, the "cultivated layer" should be supplemented by subsoiling. Air and moisture, with plant food, should be placed and kept below the dried-out surface, so bacteria can exist to make the food available and roots can get to it.

Sheridan W. Baker of Sonoma County is one who has proved the practicability of this proposition by several years' trials. His neighbor, E. D. Seaton, is another.

Three years ago Mr. Baker plowed six inches deep in half of nine acres of prune trees about 18 years old, set 20 feet apart. In alternate furrows while they were open, he subsoiled six or seven inches deeper than that, except within six feet from the trees. This required only two horses. Next spring, when he plowed the orchard crosswise, on the half that had not been subsoiled the plow ran nicely along on the plowpan, but when it hit the subsoiled half the plow buried itself so that a wheel gauge had to be put on. Since then Mr. Baker has run the subsoiler about ten inches deep every fall in the orchard to break up a soft plowpan left by his weed cutter. Each year it is run crosswise of last year's direction.

The weed cutter is a six-foot blade which cuts about three inches under the soil, simply lifting the surface dirt and letting it fall without turning up any moist soil. On a piece of morning glory he used the weed cutter every Monday, running crosswise each time of the direction of the time before. Late in the summer some passersby said that he was drying out the soil. He kicked aside the surface mulch and balled up a handful of moist

dirt to throw at them. His soil is close to the hills and is not so heavy as Mr. Seaton's. Neither of these ranches is irrigated.

The Seaton orchard is of seven-year prunes and apples on adobe and near-adobe. When the trees were one or two years old, the ground was plowed as deeply as four horses could pull a 16-inch plow. A subsoiler followed in the furrows to a total depth of about 30 inches. Two years ago the orchard was plowed 16 inches deep by tractor. Last year it was plowed six or seven inches deep and worked up both ways with a three-shovel cultivator to get it in shape for the bar weed cutter. This was run through the ground six inches deep every two weeks until November 1, alternating two or three times with a shovel cultivator as deep as the horses could pull it.

"We like to keep the ground light and airy," said Mr. Seaton. "But we don't want to turn up moist under-soil where it would dry out and kill the bacteria. We cultivate late because we like to keep the trees vigorously growing in the fall when they are developing fruit buds. We have never had trouble from fall frosts. Frost doesn't hurt trees when the sap is receding and the leaves dying, anyhow, but sour sap may. One year we had a warm rain after our neighbor's trees had started to go dormant, but while ours were still green and growing. Our trees kept on growing. His young trees started new growth, then sour-sapped."

"We have four or five inches of dry mulch. The rest is moist all the year around. These trees did as well in the dry years of 1912 and 1913 as during any other."

"Last year we ran a 'middle break' plow two round trips 12 inches deep in each row, making four furrows four feet apart. This drained and aerated our heavy land, so this year it was like an ash heap. Adobe must drain out so it is dry enough to crumble when it is turned over or it will turn in slabs and remain in clods."

Citrus Fruit Quarantine Proposed.

A public hearing on the proposed quarantine on imported citrus fruit will be held at Washington, D. C., May 8. The proposed quarantine is due to the fact that citrus canker is known to exist in eastern and southeastern Asia, the Philippine Islands, Oceania, Malayan Archipelago, Japan, and South Africa, and that fruit infected with the disease is being imported into the United States from these regions. If adopted, the quarantine will prohibit the further importation from these sections of such fruit as oranges, lemons, and grapefruit.

The commercial importations from the countries affected by the proposed quarantine are so small at the present time that the chief danger is believed to consist in small lots of fruit brought in for personal use by returning travelers. As a precaution against the introduction of

citrus canker into this country, the importation of citrus plants has been prohibited since December of 1914. The disease, however, can be brought in on fruits as well as on plants.

Citrus canker has already made its way into the Gulf region of the United States, presumably in 1911, from the Orient. The Federal and State authorities are now fighting the disease and a vigorous attempt to exterminate it by the burning of citrus trees is being made, with prospects of success in several of the infected States. The campaign is expensive, however, as it involves the burning of between \$5,000,000 and \$10,000,000 worth of citrus trees. Moreover, the western fruit districts of California, New Mexico, and Arizona are still free from the infection and every effort is being made to keep them so.

FERTILIZING VIRGINIA PEACHES.

Four years of experimental work in fertilizing peaches at the West Virginia State Experiment Station at Morgantown, W. Va., has shown that the peach is a heavier feeder than most fruits, and that it uses a large amount of nitrogen and potash and a very small amount of phosphoric acid. Early work in that State gave better results from the use of complete fertilizers than from incomplete ones. Work with single elements at first was extremely unsatisfactory and in some cases rather dangerous. Later experiments show that trees treated with nitrogen not only were healthier and sent out more fruit buds, but that the use of this element doubled the growth of trees and the yield of fruit. The use of nitrogen and potash together influences the size of the fruit. The use of nitrogen on the various orchards produced an average income per acre of \$468.85 against \$275.43 from plots which were not treated with this element. "The theory that heavy fertilization with nitrogen injures the peach is shattered by these experiments."

STARCH IN APPLE TREES.

[By W. A. Price in Ohio Jour. Sci.]

During the dormant period, starch reserve is stored in the living cells of the pith, wood parenchyma, and medullary rays of the apple. With approach of spring, starch is found in the tissues of the bark, appearing first in the phelloderm and collenchyma. As the leaves begin to appear, starch begins to disappear from the various tissues in order as follows: Bark, wood parenchyma, rays, pith. It is used first from the youngest wood of the branches in the top of the tree, later from the lower portions of the tree, and finally from the roots. A portion of the starch reserve may never be used in the growth of the tree, but remains behind to be included in the heartwood, where it remains indefinitely and renders the wood susceptible to decay.

There were sales of prunes to the Eastern trade April 20 at 6½ cents basis, with premiums for two of the larger sizes, according to O. A. Harlan of Santa Clara County.

Cresol soap is out of the market and whale oil (fish oil) soap is hard to get. Liquid soap is not made now because potash is so hard to get.

"THE BOSS" TREE PROTECTOR

Made of Yucca Palm. Is cheap, durable and quickly put on the tree. It prevents rabbits from destroying your trees. A sure protection against frosts, sunburn, grasshoppers, or dry winds. Can be easily removed, will last for years. Send for samples.

How 150 City Boys Furnish Fruit Harvest Labor

(Continued from first page.)

trees is located Camp Perkins, so called in honor of President George C. Perkins of the society. Seven big wooden platforms contain twenty-four bunks each, in which lots of straw and mattresses are put each year and covered with tents. The officers' tents are not far away. Across the baseball ground from the boys' tents are benches about 50 feet long, where the boys scrub their heads before eating. A short trail leads to the great canopy under more trees, where a dozen tables 16 feet long furnish entertainment twice a day after God's blessing is asked upon the food. The kitchen, sick-room, matron's and cook's tents are nearby, the former two being screened against flies.

Among the trees are various swings, bars, and athletic equipment to supplement the perpetual baseball. Nearby is an open-air pulpit and plenty of seats, where religious services for the boys and the neighborhood have been held every Sunday. The organ and hymn books are owned at camp and local ministers have provided the sermons.

WORK AND PLAY.

Bugle reveille calls the boys at 5:30 a. m. In a half hour they dress, wash, clean their teeth (which is done twice per day) and proceed to breakfast at 6 o'clock. At the same time lunches of a variety of sandwiches and cookies or doughnuts are put up. At 7 a. m. the boys fall in line, respond to roll call and are detailed for the day's work. If they must go over a mile, the grower who uses them that day furnishes conveyance. The grower also furnishes water and proper toilet facilities. An hour at noon for lunch and three or four hours' work afterward finish the work. There is more leisure early in the season than later. The society supervisor credits the boys with the berries they pick and encourages generous filling of trays as well as clean picking. The grower's representative receives the berries and sees that everything is satisfactory. Some days the weather gets warm by 11 o'clock, but a cool breeze comes before noon and the weather is fine.

Recreation follows work, and continues two hours after supper. There are four or five uniformed baseball nines among the boys and there is always a game on during proper hours. They often play the Sebastopol boys at the local ball park. An adult umpire prevents troubles. Several times a week they go swimming in Green Valley Creek, less than a mile away; and on Sundays they take a bath there whether they need it or not.

Saturdays are holidays except in very urgent cases of shipping berries, none of which are picked in the afternoon. Blankets and beds must be aired, tents cleaned up, camp grounds put in shipshape, and then comes whatever sort of fun a well-supervised bunch of boys can devise.

Sunday is devoted to rest, letter writing, bath, clean clothes, religious services, etc. A retired Congregational minister, William Rogers, who for ten years gave the boys the

finest kind of Sunday talks, has recently passed to his reward.

Patriotism is taught in many ways. Always during daylight Old Glory floats from a tall flag pole; and two other flags decorate the entrance and the superintendent's tent. On Saturdays, Sundays, and holidays about twenty-five flags fly from the tents, etc.

On the Fourth of July, regardless of berries, the boys celebrate right. Athletic field events for prizes, baseball, and patriotic exercises fill the day. At night they have fireworks, and sometimes a big campfire. The celebration is attended by hundreds of neighboring people. This year two or three extra field days are planned.

DISCIPLINE AND ORGANIZATION.

"We prefer to reward good conduct rather than punish boys for bad conduct," says Mr. Turner. "The great problem is supervision in camp and fields. For field work, the boys are divided into four squads, each under a supervisor, and generally working in a different berry patch. Each squad is made up at the beginning of the season, and elects its own captain and lieutenant, who help in the discipline. In separate groups, the boys are divided into seven "tent companies," according to size. Each tent company elects a captain, who is responsible for good order in that tent. These captains report to the night watchman, who keeps records of conduct for each tent. Every second Saturday a prize is awarded to the tent having the best record. Since one boy might spoil the whole twenty-four boys' chance at the prize, this makes every one a peace officer on his own account.

The most coveted prize is a trip to the Russian River and a swim. Sometimes the winners get ice cream or candy or other rewards.

Some years the boys have been organized into a regular municipal government with an elected mayor, city clerk, police officer, and athletic committee. The greatest troubles in this camp are the constant additions of new boys from the juvenile courts requiring more supervision than the rest.

ASK SCHOOL SUPERINTENDENTS FOR HELP.

What has been so successfully done with such boys for thirteen years in one place proves that it can be done in other places. Our suggestion is that our readers who have harvest work that boys and girls could do should get together and advise with the County Superintendent of Education to arrange for squads of boys or girls to work for them this summer. Sharing the expense of camp and supervisors makes it light on all and will be far cheaper than to let fruit crops dry up. If mothers, teachers, relatives, etc., can share the camp life, it will be cheaper and perhaps better for the boys or girls.

It is too late to spray for peach curl leaf, warty walnut leaves, and dark corky spots on pear leaves.

In cutting pear blight you will spread it unless tools or cut surfaces are thoroughly disinfected.

Bean Varieties Demanded by Markets.

[Written for Pacific Rural Press.]

It is admitted that even the most despised bean in normal times will be brought into more general use by the present high trend of prices as substitutes for the better grades; and already this influence has been brought to bear on the less desirable kinds.

SMALL WHITES OR "NAVIES."

Small whites or "navies" have come to be recognized as the yardstick for bean price measurements, for their use is universal, an especially strong market being found for them in New York and Boston. The army demand is for navies at anywhere near reasonable prices. Their culture, however, is more limited than the colored varieties, and many predict that at present prices their use will be curtailed and cheaper beans substituted. In fact, rumors are current that both the allied governments, as well as our own, are reducing the percentage of "navies" in their latest contracts. The coast districts are the largest growers of this variety in this State.

LADY WASHINGTONS.

White, but larger than the "navy," Lady Washingtons have found favor in the Middle Western and New York markets and are recognized, it is said, as desirable to the army buyers. They are quite generally grown in the river districts tributary to San Francisco bay; and some are grown on the irrigated lands of the interior valleys.

MEXICAN PINKS.

Mexican pinks, grown in California, are reported to have been included in recent army and navy contracts because of the difference in price between them and the white varieties; and bean operators predict a more staple market for them in the future on this account all over the United States.

Markets have been established for pinks in the past, as far East as the Alleghany mountains; and because of the scarcity and high prices of red kidneys the past season canners have put up large packs of "pinks" and successfully marketed them.

The "Manchurian pink," a bean similar to our pink, but grown in Manchuria, has been exported to this country in limited quantities, finding a market in New York and the Northwest; but during the past year entire shiploads have been imported by England and France to relieve food shortage in those countries, so they are not expected to be market factors in this country the coming year.

LIMAS.

Limas are a distinctive California product. Our growers have a monopoly, inasmuch as they are grown in only limited quantities elsewhere. Report has it that army contracts call for some limas; but without this stimulus market conditions are bright. Their production, however, is limited to southern California coast counties.

MEXICAN REDS.

Mexican reds are in practically the same class as "pinks," except that they are darker in color. They, like

pinks, are grown under many conditions in California; but the market demand is generally far less insistent.

RED KIDNEYS.

Red Kidneys have been popular with the canners; but a short crop last season advanced them in price beyond the ideas of some canners, who, as previously stated, substituted Mexican "pinks" and "reds."

BAYOS.

Bayos are white, not as finely flavored as the Lady Washington; but substituted quite generally by restaurants for the former in soup making. Markets have been established for them in Texas and the Southwest, as well as in Alaska; but their production has been reduced along the Sacramento river, where they are mostly grown because of better returns from other varieties such as "pinks" and Lady Washington.

BLACKEYES.

Blackeyes are grown extensively in many parts of California for export to the southeastern part of the United States, where a market is found for them among the negroes. They are a good dry land bean, although difficult to harvest without "shelling out" badly and cracking.

TEPARIES.

Teparies are white, smaller than the navy. They originated in Arizona and are heavy producers on dry land; but their market qualifications are considered doubtful by experienced bean dealers, due to different cooking requirements from navy beans, for which they are generally substituted, and their greenish color. Present prices are no indication of their commercial standing, as they have been brought about through extensive seed purchasing of intending planters. Dealers in San Francisco report unfavorable experience with teparies during the past season, even to the cheaper restaurant trade. Rumors that they are to be used to mix with "navies" are dispelled by the statement that the operation would so deteriorate the quality of the latter that the price would not justify their use.

HORSE BEANS.

Horse beans have not been of great commercial importance because of their susceptibility to weevil. Because of this some houses refuse to handle them for export trade on account of losses occasioned by Government regulations on interstate shipments of weevil beans. Their culture is chiefly confined to coast districts; and markets are chiefly the New York Italian districts.

Garbanzos, pink beans grown in sections of southern California, have not been a particularly attractive market bean in the past, due, it is said, to lack of selection.

CRANBERRY BEANS.

Cranberry beans have been grown in a limited way along the rivers tributary to San Francisco and latterly in Santa Barbara county; but in the latter section limas are more profitable and will doubtless supplant the cranberry popularity, at least for this year.

It seems to be a question in California, not whether to plant beans but what variety to plant. Out of the varieties that have assured market, those which suit local conditions are the ones to plant. Market demand is very unsettled now, but what is known is summarized in the above article.

We are facing a world wide food shortage. For the sake of the hungry world as well as for the good of your bank account you ought to make every foot of your land produce its utmost. You can't possibly do this without fertilizing. Germany's crop failures for the past two years have been largely due to her inability to secure proper fertilizer materials.

Why Europe Makes Bigger Crops Than the United States

Average Production of European Crops is as Follows:

Wheat 33 bushels per acre
Oats 45 " "
Potatoes.....199.84 " "
Cotton in Egypt..400 pounds "

Average Production of American Crops is as Follows:

Wheat 14 bushels per acre
Oats 40 " "
Potatoes..... 97.15 " "
Cotton185 pounds "

European farmers use about 600 pounds to the acre of a Home-Mixed Nitrated Fertilizer containing 8 per cent of Phosphoric Acid and 4 1/2 per cent of Nitrated or Nitratable Nitrogen.

American farmers apply 200 pounds to the acre of a Fertilizer containing 8 per cent of Phosphoric Acid, together with 2 per cent of Nitrogen which is mostly unavailable.

The difference in results is largely due to the large amount of Nitrated Nitrogen used in Europe per acre as **Nitrate of Soda**. Our pitifully small American yields are due to failure to appreciate the necessity of using Nitrated Nitrogen.

Vegetable Garden Suggestions.

[Written for Pacific Rural Press.]

Pumpkin Bugs.

To the Editor: Last year we lost practically our entire garden on account of the "pumpkin bugs." This year they are appearing very much earlier in the season. My squash and pumpkins are just out of the ground.—L. M. J., Walsh Sta.

Lay some shakes, boards, shingles, etc. between the hills and catch the bugs in early mornings; for, many will hide under them. Egg laying begins early, so catching one by hand now may prevent a thousand later in the season. You might dust part of the plants in each hill with arsenate of lead powder mixed with an equal quantity of flour or sulphur.

Doubled Size of Rhubarb Stalks.

In our garden in San Mateo County, the rhubarb started to go to seed early this spring. We cut off the seed stalks before the sheaths bursted and stopped that tendency. But the leaves and stalks would not grow much. We put bottomless boxes over three of the seven plants, after pulling all leaves but the very smallest. Two weeks later the rhubarb was pulled to eat. That in the boxes averaged considerably over twice as large as the best of that outside. The boxes were just large enough to fit over the plants, forcing the smallest leaves to point upward.

Artichokes.

Don't allow the artichoke buds to start to open; for then the fleshy bases will be tough and tasteless. If many are allowed to open new buds will not come. It is said that the size can be increased by tying a string around the stem tightly enough to make a marked depression in which the string lies. To get winter artichokes, let them flower in June and cut them off to the ground late in July, covering the roots then with a mulch and keeping them moist. New shoots will be bearing about Christmas. Artichokes do not thrive so well in very hot climate.

Garden Mulch Saves Water.

Lots of expensive water and cultivation are saved in O. E. Bremner's half-acre garden in Sonoma County by applying a straw or other mulch late in June among the corn, strawberries, currants, watermelons, etc. This keeps the ground moist nearer the surface and enables plant roots to feed in the soil where plant food is most plentiful and available.

CORN AND BEANS AS SECOND CROPS.

[Written for Pacific Rural Press.]

Indian corn can be planted any time between May 1 and July 1 with safety on the sub-irrigated lands in the Manteca and Ripon districts of San Joaquin County according to the experience of R. D. Rankin, who has harvested good average yields in years past.

Two years ago Mr. Rankin grew 40 acres of corn on land that was plowed well in February and planted May 8. That year he harvested 27 sacks to the acre, having an average weight of 134 pounds per sack. He also at times plants corn

as a second crop after taking off a crop of grain hay, and then irrigating the land before plowing for corn. This makes corn planting about July 1, but still the corn has time to mature before fall frosts.

Beans are also used as a second crop by Mr. Rankin. Two years ago he harvested nine sacks of Mexican Reds to the acre after first having harvested a 30-sack crop of barley on the same land. The beans were planted July 1.

ELEVEN TONS OF ALFALFA PER ACRE.

[Written for Pacific Rural Press.]

Early in April our attention was attracted to an exceptionally fine field of alfalfa in Stanislaus County that contained 40 acres and was owned by Standiford Boren. We were told that the field was sowed in March three years ago after thorough preparation of the land. The seed was broadcasted; and before it could be harrowed in, it began to rain; and before the field could be worked again the seed began to sprout.

It was the common Chilean variety; and during the first season the field yielded an average of eight tons to the acre, care being taken against too frequent irrigation, as the land sub-irrigates some, and it has been the experience of alfalfa growers in the section that two or three irrigations during the season are better than an irrigation for each crop.

In 1916 Mr. Boren spread 300 pounds of gypsum to the acre after the first crop had been harvested; his theory being that the first cutting is good anyway because of the long growing season, but that subsequent cuttings are speeded up a little by gypsum. That year he harvested 11 tons of hay to the acre from the entire field. A liberal coating of barnyard manure was applied last winter with the expectation of maintaining a high average yield this year. The good even stand that he secured was largely accounted for by Mr. Boren by the fact that the rain followed directly after seeding, thus sprouting a larger percentage of the seed than would have otherwise resulted.

HEAVY YIELD OF SUDAN.

To the Editor: Answering your question, I have planted some sudan grass seed each year partly on sediment soil, partly on gravelly clay loam and partly on adobe. The gravelly clay loam did as well as any. The grass was always killed by winter frosts, but survived light frosts in the fall. My tonnage per acre for hay is only approximate. I should say that it averaged 2½ tons, but none of it was irrigated. I generally had two cuttings per season for hay and a more or less heavy pasture crop after. I cut my seed when dead ripe and beginning to shatter. After that there was a light hay crop or a very heavy pasture crop.

One year I cut oat hay the first day of June and immediately plowed the land and sowed it broadcast to sudan (the other plantings were in

BEAN Opposed Engines

In Stock for Immediate Delivery

The Bean "Opposed" is a two-cylinder four-cycle engine with the cylinders placed on opposite sides of the crank shaft. This "Opposed" type has many advantages over single cylinder engines.

The opposed action makes the balance of the engine practically perfect—engine may be run at full speed in any place and under any conditions without destructive vibration. A heavy foundation is not necessary, as Bean opposed engines run smoothly and evenly.

BEAN FEATURES

LIGHT WEIGHT: The peculiar design of the Bean engine makes light weight practical without the least sacrifice of strength or durability.

FREEDOM FROM VIBRATION: Bean engines are two cylinder and have perfect balance, run just as satisfactorily on a truck as on a concrete foundation.

CONSTANT SPEED: The opposed type of construction affords constant uniform speed. Ordinary engines stop when the speed is cut down by momentary overload. Bean engines recover quickly.

SIMPLICITY: The Bean engine is free from complications. The mechanical movements are all simple and direct.

DEPENDABLE: Only best materials are used, and all parts carefully machined by expert mechanics; thoroughly tested before leaving our factory, and ready to run day or night.

BUILT-IN MAGNETO: Engines are furnished with Bosch high-tension magneto, requiring no batteries or coil. Some sizes equipped with make and break ignition if desired.

This engine is adapted to a wide range of uses. It is a practical outfit that can be used if you want a dependable power unit at your disposal night or day.

Write for information and let us tell you about the Bean Opposed Engine best suited to your requirements.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

CITIES MUST FURNISH POWER FOR GREATER FARMING.

[By Dean Thomas Forsyth Hunt, at the Agricultural Inquiry undertaken by the State Council Defense, San Francisco, April 23.]

What has a great city to do with the production of food stuffs for our allies? The answer is that if anything more is done than is already being done, it must be done by the people of the cities, primarily by those of the large cities. Most people think that the raising of a surplus of food products is a rural problem. It is not. It is an urban problem.

Every farmer is now working at top speed. He is using every dollar of capital and every ounce of muscle he possesses. The farmers are anxious and willing to help, but without the aid of the cities they are powerless to do more.

There are about one-quarter of a million persons in California engaged in agriculture and allied industries. There are approximately one million in other gainful occupations. In the United States as a whole of every three persons in gainful occupations one is engaged in agriculture; in California the relation is five to one. This is no time to discuss reasons. Suffice it to say that assuming a three years' war, one-quarter of a million people now in the cities of California will be needed to win this fight for democracy. Fifty thousand will be required for the army and navy and for ship building, and 200,000 will be required on the farms. Twenty thousand are needed at this moment in the open country.

It is time the American people began to deal in realities. It is all very well to talk about what women and children can do—and the more they do the better—but the need in this great emergency is strong, able-bodied men between the ages of 19 and 35. Unless we intend to depend upon the allies to win this war for us, one man out of every four now employed in the cities must change his occupation. There are many activities in the cities which are highly desirable in times of peace, which must be curtailed during this crisis. If the people of the cities do not solve this problem the German Government will solve it for them.

During the past week we have conducted an agricultural inquiry in 37 counties in California. Everywhere it is a question of power; more man power, more horse power, more mule power, more gasoline power, more electric power. It has become a refrain: "Power, power, power, give us more power. We have land but we do not have power."

Much transient labor has gone east to the munition factories. Even horses and mules have faded away. Everybody knows where they have gone. As soon as enlisting begins in earnest the situation will rapidly become worse. Every army division of 22,000 men requires 7,500 horses and mules. For every three men that enlist in the army, one horse or mule will be required to make them effective. Notwithstanding the fact that the motor truck saved Verdun, immediately behind the army of one million men there were 300,000 horses and mules. The number of horses cannot be multiplied during the period of a three years' war. If every farmer in the United States decided today to raise more horses, there would not be another single horse in this country tomorrow.

What is the answer? Substitution of gasoline power for mule power on California farms. What is needed is a corporation with a capital of \$5,000,000 to build and man farm tractors and then rent the man and the tractor to the man on the land. The capital and the men must come from the cities. Every dollar and every man in the open country is now employed.

I am putting it up now to the people of San Francisco to furnish the money and to furnish the men, if not by a group of financiers, then by popular subscription. The only sacrifice may be a possible loss of a few dollars. If the enterprise is well managed it may even pay dividends. But I am not putting this up to you on this basis, nor deciding the best method of doing it. If you desire to win this war here is your opportunity. This is the real need. Will you meet it? Loaning three billion dollars to our allies cannot help them greatly unless somebody has something to exchange for the money. If we do not have it, who will?

WATER INCREASED PRUNE SIZES.

[Written for Pacific Rural Press.]

Sonoma County, which has long boasted of her freedom from irrigation, has found by experience on 500 or 600 acres put under irrigation last year, that the increased crops are better than the reputation for that kind of dryness.

At the county food investigation held in Santa Rosa April 18, it was stated that 5,000 acres, mostly of young orchard, could be irrigated from Russian River. Horticultural Commissioner O. E. Bremner is enthusiastic over the possibilities, especially on the lighter soils. On the adobe and heavy soils, moisture can be saved all summer by fine cultivation of the surface until early fall. F. A. Abshire, however, has irrigated 60 acres of prunes from a pump for six or eight years. He gets no greater tonnage, but much greater size, which is better than increased tonnage. A 12-horsepower engine runs a seven-inch centrifugal pump for him, lifting the water about 20 feet. He floods part of the orchard once; but the lighter part twice. "Everybody who has an orchard ought to irrigate," says he.

SMITH FORM-A-TRUCK.

[Written for Pacific Rural Press.]

Eight different sorts of wagon beds may be formed on the Form-a-Truck frame by using demountable sections. The body is designed to replace the body of a Ford car with a channel-iron frame on which the beds are built. It is guaranteed of one-ton capacity. The sections include a single wagon bed, solid side boards and end boards which hinge on so they may be used for a bulk-grain truck with scoop board at the rear, or the upper side boards may be flared or set flat for a flat rack. Two sets of panel sides and a pair of panel ends may be set on vertically for a stock rack, or the lower one may be flared for lighter bulky produce such as cabbage, fertilizer, seed cotton, etc. If a closed body is desired, the upper panels form the top by bending their hinges toward center. If a flat rack for hauling crated goods is desired, the side boards are set on flatwise and panels vertical from their outer edges.

SIPHONING WATER.

To the Editor: I want to siphon water from a ditch with a rise of a foot to irrigate some garden truck, trees, etc. Can it be done without power?—J. W., Oakdale.

If the land to be irrigated is below your ditch water level, it can be irrigated by syphon without power. Otherwise it can not. Unless you have a pump with which to start the water flowing through the siphon pipe, it will be necessary to turn the pipe upside down, fill it with water, close the ends, turn it over so one end is under water and the other end below water level, open the end under water first, then the outside end, and let it run.

POWER NOTES.

A light-weight electric tractor to displace hand work in the garden was shown at the University Farm picnic along with several other types.

The Earlimart district of Tulare

County is being converted to irrigation from wells. Considerable new alfalfa has been planted and prospects are fine.

A newspaper report has it that Henry Ford has given the British Government his patent rights and specifications for the Henry Ford tractor; and that he hopes to have many tractors ready for use in the United States by August 1. Several other machines have already been put out as "Ford" tractors.

Heap big mileage!

Built-In!

If you could dissect a SAVAGE you'd realize that "Heap big mileage" is built into it during every minute of its manufacture.

Highest grade rubber and fabric, perfectly balanced design, most careful workmanship, full size.

A tough road-gripping tread—neither so heavy as to produce stiffness, nor so light as to give insufficient protection to the carcass. Cushion of high-grade resilient rubber—absorbs the road shocks. Sidewall specially shaped to distribute flexing—will not crack.

And the carcass—finest Sea Island cotton, long fibre, tough, triple tested, built up layer by layer into the strongest carcass that can be made.

High mileage, low cost per mile. Sold from factory to you through our own distributors. Watch for the red Savage sign.

SAVAGE GRAFINITE TUBES

The only tubes that have graphite vulcanized into the surface. Prevents deterioration, sticking, friction and heating. Makes soapstone unnecessary. Lengthens life of tube.

General Agricultural Review

Field Crops.

The onion crop of Coachella Valley will yield farmers \$750,000.

Spinach is attracting much attention around Sacramento just now. Canneries are actively working on this vegetable.

There will be sixty per cent of a wheat crop in the Porterville section, perhaps more, and the output will be 250,000 sacks.

The high school boys of Los Angeles are now helping the beet growers of the Van Nuys district to thin their beets and save the crop.

Hop growers are warned to reduce their acreage as the demand is small and the prices very low. There is also a large surplus of holdover.

W. B. Russell of Los Angeles, who has just returned from a trip of inspection, estimates a shortage in the grain hay crop of Southern California of twenty-five per cent.

The Board of Education of Chino declared last week a holiday, to give the high school boys and grammar school boys a chance to work in the beet fields and help to save the crop.

The program for the Annual Rice Festival at Madison, to be held on May 12, has been completed and all Yolo county citizens are invited to participate. There will be a free barbecue at noon.

M. H. Cottrill of Biggs says the rice in the Doty warehouse is shipped out. A small amount held to the last sold for \$3.50 a hundred. The greater amount went earlier and brought small figures.

Farm Adviser Lee of Alameda county states that a larger acreage of peas has been planted in that county this year than last and that the prospects are for an increased acreage of tomatoes. Cannerys are offering \$10 a ton for tomatoes, agreeing to furnish the boxes.

The grain crop in the coast counties, from San Francisco south, is very spotted. In Monterey, the north part of the county, the prospects are for a fair crop, while in the southern half there will be very little grain or hay. In San Luis Obispo and Santa Barbara counties the grain and hay

crop looks very good at this time.

News comes from Huntington Beach that the Holly Sugar Corporation is sending out letters to beet growers around Huntington Beach stating that arrangements were being made for the company to pay a price for the beets based on the price received by manufacturers for sugar, the corporation sharing with the grower the extra profit derived from the high price of sugar.

The sugar made from the 1916 beet crop was 820,657 short tons (2,000 pounds each), which was about 54,000 tons less than in 1915, but 169,000 more than the average yearly output during 1910-1914. California's output was 236,322 tons, yielding 18.35 per cent of sucrose (pure sugar) in the total soluble solids of the beets. California's total acreage in beets was 141,097 acres.

Citrus and Semi-Tropical.

The outlook for a good fig crop in Stanislaus county is promising this year.

The Sierra Heights Citrus Association, recently organized at Lindsay, will erect a big packing house there.

Warm weather the past week has hastened the maturing of the Valencia orange crop, which, contrary to early reports, is now expected to be normal.

The California Fruit Growers' Exchange expects to market 3,500 cars of navels and 1,000 cars of other varieties of oranges this season after May 1st.

Practically all grapefruit nursery stock in Southern California has been shipped to Texas for planting. During the past two years hundreds of cars have been shipped.

It is announced from Redlands that there has been 627 more cars of oranges shipped from there this season than last, and the oranges have brought more money in the east.

It is said that the Valencia orange shipments this year from the Fullerton Placentia district will reach between 1,200 and 1,300 cars. The value of the crop is put at \$1,200,000.

Riverside county, the home of the orange, is changing to deciduous fruits. Already the acreage to the latter fruits is as large as of oranges, lemons and grapefruit, and planting now is largely in favor of deciduous.

Deciduous Fruits and Nuts.

Ventura county will have a fair crop of apricots. In the Ojai country the setting is very heavy.

In Pajaro valley investigation shows apricots and apples not to have been so badly damaged by frost and rain as was earlier thought.

The Hayward district has this season the best apricot crop in Central California. Nearly all the orchards between Mt. Eden and San Leandro have seventy-five per cent of a full crop.

A ten-pound box of California cherries shipped to Detroit, Mich., and sold at auction April 30, brought the almost fabulous price of \$125, or at the rate of \$12.50 per pound.

Wyandotte and Palermo peach growers are contracting their crop at an average price of \$27.50 a ton to an Oakland cannery. The greater part of the tonnage consists of Muir peaches.

The walnut crop from Santa Barbara county south as far as Orange promises to be very large, if the blight does not affect it. Trees are now well loaded and but little blight in evidence.

The first cherries of the season were included in two eleven-pound boxes consigned last week, one to Chicago and the other to Kansas City. The cherries were large and of good color.

Settle the Spreader Question

THE farmer who uses a Low Cloverleaf, Low Corn King or Low 20th Century spreader these days is the man who makes the most money. His land increases in value when regularly fertilized. His crops grow better in quality and larger in yield when supplied with available plant food. Of all the spreaders on the market, the Low Cloverleaf, Low Corn King and Low 20th Century come nearest to doing this work as it should be done.

It is a long jump from the ordinary machine to the modern low spreader with its double beater and wide spread. Every farmer who knows the value of good spreading is buying one of these wide spread machines. As a matter of fact, no farmer can afford to buy any other kind, because the saving of time and labor and the better job of spreading done by a Low Cloverleaf, Low Corn King or Low 20th Century makes them worth more than ordinary spreaders.

Complete information about these machines is worth money to you. Drop us a line at the address below and we will show you very plainly why it will pay you to buy a Low Cloverleaf, Low Corn King or Low 20th Century spreader.

625 Market Street, SAN FRANCISCO

The cherry crops in Santa Clara valley look well, and barring adverse weather, there will be a good crop of black cherries. Royal Annes are setting fully as good as the blacks in many soils.

Buyers are busily engaged in combing the apple districts around Pajaro for apples. As high as \$17 and \$18 have been offered with chances that the price may yet go as high as \$20 per ton.

A number of growers in the Sunnysvale district have been offered 12 cents per pound for the cherries in sight, but refuse to contract on that basis, as they believe that 16 cents will be offered before the fruit is in condition to market. The crop is reported to be less than one-half of normal.

The Federal labor union of unskilled workers, known as the Toilers of the World, comprising men, women and children employed as cherry pickers and packers, have formulated a demand for \$2.50 per day of ten hours work, commencing with May 1. All overtime at the rate of 30 cents an hour.

It is reported that J. R. Martin of San Francisco has signed a nineteen-year peach contract with Libby, McNeill & Libby of Chicago running from 1918 to 1936 inclusive, and covering a delivery of 65,000 tons of peaches, or 130,000,000 pounds. This is the largest fruit contract of its kind ever signed in California, and covers the crop of 1,000 acres yet to be planted.

Grapes.

The La Paloma Winery and Distillery has filed application with the courts for permission to disorganize.

The juice of wine grapes can be concentrated into a syrup that can be used for the canning of most kinds of fruit, Prof. F. T. Bioletti of the University of California asserts. Wine grape growers are advised to make other disposition of a part of their produce this year, rather than send the grapes to an already overstocked wine market.

Miscellaneous.

A Yolo county national farm association has been organized.

The supervisors of Riverside county have voted \$2,000 a year for support of a farm adviser.

The Canadian government has placed wheat, wheat flour and semolina on the free list, thus opening United States markets to Canada and Canadian markets to the United States in these products.

The Rural Press is informed that the German Kali Works, with offices at 25 California street, this city, have

decided to close temporarily their propaganda on this coast owing to the present war situation. They hope to resume operations when normal conditions return.

At a meeting of the directors of the Yolo County National Farm Loan Association it was reported that a total of \$60,000 in government loans have been filed.

The Riverside Bee Keepers' Association at a late session adopted a resolution advising the bee men not to sell their honey crop this year for less than 11, 10, and 9 cents a pound, for the three grades of the extracted product.

A correspondent recently visiting Santa Ana says: "Crops there look fine—apricots best in years, walnuts same; orange trees in bloom; sugar beets big acreage and look fine; barley fair; hay a little less than usual; labor very scarce."

The holdings of butter in cold storage in Los Angeles April 26, 1917, were 20,265 pounds against 6,229 pounds the same date last year, an increase of 14,037 pounds. The holdings of eggs in cold storage in Los Angeles April 26, 1917, were 56,176 cases against 43,314 cases the same date last year, an increase of 12,862 cases.

The meeting of the State Council of Defense with farmers of the Imperial valley last week was a full success. The visiting officials assured the farmers that the state of California would get behind the temporary weir, which it is proposed to build in the Colorado river at Hannon's heading. In return the farmers declared that they would plant 75,000 more acres than ever before to milo maize, tepary beans, peanuts and other late crops of vegetables, grain and forage.

Tulare Tree Planting.

The following table is furnished by Horticultural Commissioner Collins of Visalia, covering trees planted in Tulare county from Oct., 1916, to March, 1917:

Variety.	No. Trees.
Apples	2,622
Apricots	8,629
Almonds	5,341
Berries	76,592
Figs	17,104
Grape Vines	209,149
Lemons	4,017
Nectarines	1,427
Oranges	13,941
Olives	3,525
Pears	4,452
Peaches	40,640
Prunes	185,186
Plums	10,701
Pomegranates	2,196
Quince	1,488
Ornamentals	25,865

Crop Conditions in Orange County.

Roy K. Bishop, horticultural commissioner of Orange county, writes under date of April 28: "The crop conditions in this county are normal and many of the crops appear to be just a little above normal. The citrus are in a very excellent condition and blooming very heavily. Walnuts give every indication of heavy setting. Apricots are very heavy. The acreage has been reduced by taking out trees. Beets are in fine condition and making a fine growth. Thinning has been slow due to unsettled labor conditions. Barley hay and grain is about seventy-five per cent of normal. Conditions for beans are good

and the acreage will greatly increase. Condition of cabbage is below normal there being a large percentage seeders. Potatoes are in fine condition and making a good growth. Normal crop."

The ninth annual California Raisin Day celebration was carried out at Fresno last Monday with great enthusiasm. It is estimated that 100,000 people were present, including many notable persons and visitors from all sections of the State. The celebration was patriotic in character, and the proceeds of the festival are to be donated to the Red Cross fund.

Profitable to Replace Poor Cows With Good

[Written for Pacific Rural Press.]

When he started to dairy at his present location near Sebastopol, Sonoma county, three years ago, C. S. Hamilton bought the herd of cows that were on the ranch. At that time his average income per cow was about \$7 a month and it did not take him long to see that he would soon be out of business on that basis.

Accordingly, he started to sell them off as soon as he could and replace them with the best cows he could get from the older and better Jersey herds of the county. That he has succeeded was shown by his January cream check from the Petaluma Co-Operative Creamery, which amounted to \$911 for the 57 cows he was milking, or about \$16 a cow for the average monthly production of over 37 pounds fat per cow.

In securing this production, Mr. Hamilton was handicapped by the meanest weather of the year for dairy cows, the first two weeks being very cold, and practically no green feed being available during the entire month because of the cold and dry weather. Production of most herds in the district at the time were away below normal for

the month even though heavy feed purchases were the rule.

While breeding was undoubtedly the most important factor in the herd's yield, feeding and care were also important considerations. Baled alfalfa hay was used for roughage most of the time, about 1,000 pounds a day being fed, supplemented with an 11-pound concentrate ration of cocoanut meal, shorts, and bran. The mixture of the latter for the entire herd per day was as follows: 180 pounds cocoanut meal, 210 pounds shorts, and 240 pounds bran.

Besides breeding and good feed, regularity of feeding and milking are essential to high yields in Mr. Hamilton's mind, and for that reason he is always punctual in his work.

With the actual demonstration of the value of good breeding before him, Mr. Hamilton has taken steps to perpetuate the producing qualities of his herd by securing a purebred Jersey bull for use on his cows. Only the heifers from the best cows will be retained for the future herd; and even those will be closely culled in order that the herd average may be still higher than at present.

More About Carobs for Stock Feeding.

To the Editor: I would request your valuable paper to encourage and spread the cultivation of one of the most valuable trees for California, so far neglected, and this is the St.-John's-bread tree—*Ceratonia siliqua*.

This tree thrives on dry hills in similar climates to ours, in Spain, Italy, Dalmatia, etc., and should prove a most valuable acquisition for our State.

The tree when full grown bears from 200 to 250 pounds of the so-called St.-John's-bread—a most valuable food for horses, cattle, hogs, etc., one pound being the equivalent of two pounds of grain.

The fruit contains from 30 to 46 per cent of sugar; 6 per cent nitrogen, etc. It is of a sweet, pleasant taste much relished by children.

In England it is an important constituent of many cattle foods.

The bark of the tree contains from 50 to 55 per cent tannin.

The tree is also very ornamental and furnishes shade to cattle. It will not grow on wet ground. The

seeds germinate when mixed in wet saw dust in about two weeks.

The most important item in transplanting is that the main root must be perfect. If broken off, the seedling will not grow well.

I hope the Rural Press will be able to induce a great number of landholders to start the cultivation of this plant.

FRED HOHLWEG.

Fairfax, Marin Co.

[This plant, which is commonly called carob in this country, has been introduced into California from time to time since pioneer days and old bearing trees can be found in many valley and foothill situations. It does exceedingly well and is handsome for ornamental planting and would be profitable for stock feeding according to standards prevailing from prehistoric times in Asia Minor. It can be purchased from California nurseries carrying ornamental trees in variety. Horticultural Commissioner Beers of Santa Barbara has recently taken much interest in its wider planting.—Editors.]

Breeding Into Purebreds

[Written for Pacific Rural Press.]

It has often been suggested that the surest way for the ordinary dairyman to get into purebred cattle is for him to secure one or two extra good cows and gradually increase his purebred herd by the natural increase. That this method is practicable is shown by the experience of C. A. Whitsett of Glenn county, who started with purebred Jerseys two years ago by purchasing two Jersey cows, 11 and 12 years old, from a prominent Jersey breeder. While old, both of these cows had Register of Merit records of over 500 pounds of butter fat in a year and both were bred at the time of purchase. Be-

cause of their records these cows cost a goodly sum; but they insure Mr. Whitsett a solid foundation for his future herd.

Both are heavy producers; and during the two years have dropped four calves, thus enlarging the herd materially, although the heifers are not yet fresh. The fact that they are both old does not interfere with their paying good interest on their investment; and in a few years Mr. Whitsett expects to be able to substitute his present herd of sixteen grade cows for heavy producing purebreds raised from these two cows and their progeny.

This Herd Offers Unequaled Possibilities for Records.

COMPLETE DISPERSAL

Stanford Holsteins

VINA, CAL.

June 5, 6
and 7

One of the Many Great Individuals

America's greatest sale of registered purebred Holsteins is to be held at Vina, California, June 5, 6 and 7, on the Stanford ranch.

By the infusion of the finest blood strains, this herd, founded by the late Governor Stanford in the early 80's, has been developed until it is without a peer. The dispersal of this herd is a great Holstein event.

A RARE OPPORTUNITY FOR ADVANCED BREEDERS, DAIRYMEN AND BEGINNERS.

In this grand herd to be auctioned at Vina are:

40 GRANDDAUGHTERS OF KING OF THE PONTIACS

40 GRANDDAUGHTERS OF COLANTHA JOHANNA LAD

20 GRANDDAUGHTERS OF SEGIS PONTIAC DE KOL BURKE

Just stop to consider what this blood means. King of the Pontiacs and Colantha Johanna Lad are the two outstanding proven sires of the day, and they are doing more than any other sires in the second and the third generations. Segis Pontiac De Kol Burke is one of the best bred bulls in the world and was senior and grand champion at the California State Fair in 1916.

WHY GO EAST FOR AN UNCERTAINTY WHEN SUCH GREAT STOCK CAN BE HAD FROM THIS PROVEN HERD THAT HAS NOT BEEN DEPLETED BY SALES?

IN THIS HERD ARE 40 A. R. O. COWS AND MANY OTHERS THAT WILL DO AS WELL OR BETTER. THE INDIVIDUALS ARE ACCLIMATED AND HAVE THE GREAT GROWTH POSSIBLE ONLY ON THE PACIFIC COAST.

LIVESTOCK BROKERS

Two Hundred Sows as a Side Issue.

[Written for Pacific Rural Press.]

The numerous carloads of prime market hogs that are turned off at two to three week intervals from the Stanford University's ranch at Durham, Butte county, are mostly profit, according to Managing Foreman F. C. Franklin, because they are almost entirely a by-product of the 18,000-acre ranch on which they are grown.

It is the aim of Superintendent J. F. Van Loben Sells to keep about 200 brood sows on the ranch at all times, mated with purebred Poland-China boars. These are given the run of grain stubble, as well as of fields containing large oaks that furnish a plentiful supply of acorns, which cannot well be fed to the market hogs on account of their oily effect on the meat. More or less careful watch is given the sows, and at times of short feed supply grain is hauled out to them in the fields.

In the past the sows have farrowed in the open; but new hog quarters are being provided which will allow better care at farrowing time and a consequent increase in the number of pigs raised. No special dates are set for farrowing; but care is taken in breeding to insure against winter litters because of the difficulty in caring for pigs during cold and wet weather.

The natural conditions on the

ranch provide for a continuous supply of good feed, green feed being available soon after the winter rains commence in ordinary years and lasting till barley stubble comes on in the early fall. This in turn supplies fattening pasture till the rice is harvested, when another supply of stubble is available, this rice stubble carrying the hogs through till the green feed begins to grow again in the spring.

Except for dipping, which is done at regular intervals in a concrete dipping tank, where Creso dip and crude oil are used, the hogs receive very little hand labor till they are ready for the finishing pens. Usually they are about 12 months old at this time. Having had a good supply of grain most of their life, they are in prime condition for fattening.

During the past fall and winter the finishing ration has been crushed rice, tankage, and alfalfa hay. The rice is cooked in large iron kettles and fed in slop form in a dry corral. Five pounds of tankage is mixed with each 100 pounds of dry rice; and alfalfa hay is fed in racks. On this ration several carloads have gained an average of two pounds per hog per day for three weeks the past winter and have been good enough to top the market several times at a weight of about 200 pounds.

GUARDING CALVES AGAINST TUBERCULOSIS.

[Written for Pacific Rural Press.]

Regardless of the fact that they have their herds tested for tuberculosis at regular intervals, many dairymen and breeders suffer slight losses occasionally from the disease; and to overcome this the Bridgeford Co., at Knightsen, Contra Costa county, sterilize every bit of milk before feeding it to their registered Holstein calves.

Steam is used for this purpose, the milk being placed in a large galvanized iron tank after the other work is done in the morning. A steam hose is turned into the milk, heating it to a temperature of 160 to 170 degrees. After thorough heating, it is run out of the tank over a brine cooled milk cooler, the temperature being reduced to about 35 degrees. It is then set in the cooling room and held till feed time, when it is again warmed to a blood heat.

By this practice all of the calves' milk is known to be free of tubercular germs, despite the possibility that one or more of the cows may have contracted the disease since the last testing.

PASTEURIZATION LAW.

To the Editor: Please tell us the law on pasteurizing milk. Will it pay farmers who have only a cow or two to invest in a pasteurizing plant if they are selling butter to neighbors? In selling only butter, can cream alone be pasteurized? Must one pasteurize if cows are tested?—A. E. S., Lockwood.

Under the present law no one must pasteurize if they do not sell milk or cream for direct consumption. The law will probably be amended to include milk for butter. It applies to everyone regardless of number of cows or who are the consumers. Milk from cows which do not show tuberculosis when tested

free of charge by the State Veterinarian, Sacramento, need not be pasteurized for any purpose, and we would not invest in a pasteurizer unless the cow is diseased. If she reacts but looks healthy and the milk seems normal, pasteurize the cream only, if you do not sell milk, and raise calves on skim milk brought to boiling point per article in recent issue. A copy of the present law and proposed amendments can be obtained from Assembly Clerk, Sacramento.

MISTLETOE AS STOCK FEED.

To the Editor: Kindly answer in Pacific Rural Press whether or not ordinary mistletoe, such as forms in bunches in oak trees (principally), will poison horses, cattle, and goats if eaten by them. There seems to be much difference in opinion about the matter in Placer county, and the writer presumes that an answer will be interesting to many.—G. L., Auburn.

[Answer by Dr. H. M. Hall.]

Mistletoes have been known to stockmen and others for many hundreds of years and animals have browsed upon these plants to a greater or less extent for all this time and yet there has never been a demonstrated case of poisoning from them. Within the last few years some of our stockmen have been utilizing the mistletoe by cutting it and feeding to their animals, and there is no indication that it is harmful in any way. I think that if carefully investigated all so-called cases of poisoning by mistletoe will be found to be due to some other cause.

University of California, Berkeley.

See that bottles of serum and virus for hog vaccination have labels indicating the dates after which they should not be used. Fooling with bum serum is no joke.

Broken or sagging wire fences are more dangerous than well tightened wires.

GET RID OF LICE

Let your hogs rid themselves of these blood sucking pests and keep free from cholera.

Do You Want Long Distance Backing?

We have a son of the California State Champion three-year-old for sale. Born October, 1915; Sired by PRINCE ALCATRA KORNDYKE, whose dam is TILLY ALCATRA.

The Dam of this young bull is not a fifty-lb. cow, but she has to her credit 21,208 lbs. milk and 860 lbs. butter in one year, which is the largest record ever made in California by a Junior three-year-old.

If you are in the market for a bull, it will pay you to visit our ranch and see what we have to offer—at prices that will surprise you.

J. S. GIBSON CO., Box 97, Williams, Cal.

"THE NAME GIBSON INSURES QUALITY."

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

Certificates of stock are being transferred among the shareholders of the Merced Creamery, following the increasing of capitalization some time ago from \$6,000 to \$30,000. The creamery is making steady gains in business.

Dummy cows are perhaps the most interesting part of the machinery of the new schools of farming which are springing up all over rural England for the purpose of teaching the rudiments of milking to young women volunteers for work on the land.

C. S. Rasmussen of Loloeta announces the sale of the following stock this year: Bull to John Roth, Solvang, Santa Barbara county; bull to R. Neilsen, Hollister, San Benito county; bull to A. Enos, Ferndale, Humboldt county; bull to J. M. Fretis, Elk River, Humboldt county; bull to Mantova & Company, Elk River, Humboldt county; bull to H. Thomsen, Loloeta, Humboldt county; heifer to J. H. McCloskey, Arcata, Humboldt county; bull to F. Fleckenstien, Arcata, Humboldt county.

When the California Holstein-Friesian Association meets at Chico June 6, some addresses will be given dealing with the great Stanford herd at Vina, the dispersal of which will be effected by a sale beginning June 5 and ending June 7. M. H. Tichenor, who has been commissioned by the trustees of Leland Stanford Jr. University to dispose of the 300 purebred Holsteins on the Stanford ranch, has received many requests for permission to make selections from the herd prior to the sale but these have been rejected so that everyone will have an equal chance.

The butter situation just now is a peculiar one. With stocks in cold storage April 1 as reported by the government, holdings of 265 firms were 6,208,763 pounds against 3,272,342 pounds held by 199 firms the same date last year. Yet in the face of this showing the price of butter here on the coast is 14 cents per pound higher. The same report shows that there was unloaded out of cold storage during March 9,470,701 pounds by the same firms, against 12,072,571 pounds the same month last year. In the face of this showing the central west and east has been drawing butter from California all spring. The result has been an increase in cold storage holdings in the north central houses and north Atlantic houses. There can be but one explanation of this hoarding of butter in the east, and that is an anticipation of an active export demand as soon as the United States and the allies force Germany to raise the blockade of the United Kingdom.

Beef Cattle.

In co-operation with the food supply committee of the State Council for Defense, the U. S. Forest Service is making plans to stock to their very fullest capacity the national forest ranges. If the stock can be secured and the money raised for necessary trails and water developments, an increase in the number on the ranges equivalent to 80,000 head of cattle might be made.

Swine and Swinemen.

B. F. Graham of Los Angeles is building up a pure bred ranch at Colton. He already has a large number of purebred Durocs and will soon add a Holstein dairy.

We have received from the American Berkshire Association a handsomely printed booklet which makes out a strong case for the Berkshire hog. Its belief is summed up in its motto, "One breed may rise—another fall, the Berkshire hog survives them all."

Shipments of mixed hogs from the Riverside district bring 13½ cents.

Recent sales made of Duroc-Jersey hogs by Peters, Lamson & Walker of Fontana are as follows: J. S. Pendergast of Redlands, boar by Defender and four sows; to A. H. Frank of Los Angeles, 15 sows and one boar; to Socialist Colony of Llano, 20 sows.

Seventy million dollars a year is wasted in the United States through hog cholera. This means that a billion pounds of hog meat is needlessly wasted every year by hog cholera. Dressed, these pigs would have yielded eight hundred million pounds of dressed pork and lard, or enough to give forty pounds of good food to every family in the United States.

R. H. Whitten of Los Angeles reports the following recent sales of pure bred Poland-Chinas from the Whitten ranch at Terra Bella: Allen Raymond, Winters, one boar and bred gilt; C. S. Booth, Delano, one boar and bred gilt; L. W. Boothe, Pasadena, two gilts; Mrs. L. H. Brady, Weaverville, pair of weaned pigs; Rev. R. W. Cleland, Eagle Rock, one boar; J. Harold Cloer, Porterville, one boar; Joe Cox, Gridley, boar and two gilts; E. J. Daetweiler, Porterville, one boar; W. T. Elliott, San Fernando, boar and three bred gilts; D. H. Forney, Fresno, bred gilt and two sow pigs; D. E. Goodwin, Pixley, one boar; Paul Hopkins, Willows, one boar; L. R. Lenfert, San Jose, one boar; Thos. H. Luney, Pixley, one boar and six bred gilts; R. M. McDarment, Porterville, three bred gilts; M. L. McDonnell, Cooperstown, one gilt; A. A. Quackenbush, Acampo, one boar; B. F. Ryder, Soquel, one boar and gilt; C. A. Rives, Burbank, two bred gilts; F. C. Splane, Calipatria, one boar; and S. M. Walker, Baldwin Park, one boar. Prices paid ranged from \$20 for weaned pigs to \$100 for bred gilts.

Sheep.

Three thousand sheep are feeding on the Spring Valley Water Company's lands near Crystal Springs lake, San Mateo county. They will soon be increased by 7,000 more. The company is making 13 cents a head a month for leasing land for this grazing purpose.

A sheep-shearing machine is being operated on a large band of sheep in Fresno county. The machine works on the principle of horse clippers and is run by a small engine. Two men are required to operate the machine and the fleece can be taken from upwards of 150 sheep in a day's run, it is said.

A single wagon load of wool brought into Livermore from John McGlinchey's sheep ranch in the Tesla district recently realized the record price of \$2,820.08. It was made up of 870 fleeces, which brought 40 cents a pound. It is said the same wool would now bring 50 cents.

A trainload of lambs was shipped last week from Brawley to the Denver market. Hitherto all the lambs raised in the Imperial valley have gone to the Los Angeles and San Francisco markets. Shipments of cattle, hogs and sheep and poultry continue active from the valley, most of them going to the Los Angeles and San Francisco markets.

One of the first to enter the mutton field in southern California is John E. Marble of Los Angeles. On his 120-acre ranch near Redlands is a flock of registered Romney and Dorset sheep, thought to be among the best in the state. The Romneys, four ewes and a ram, were imported from New Zealand. Three of these ewes now have lambs. The Romneys are an English breed noted for their hardiness and readiness with which they fatten. The horned Dorsets are also a mutton breed noted for their hardiness and early lambing and they make an excellent cross.

Horses and Mules.

John Lutz of Redding has imported a jack and eleven jennies from Missouri at a total cost of \$11,000. The jack alone cost him \$3,500.

Miller & Lux have bought the nine head of jacks recently shipped to Tulare from Tennessee, the consideration being \$14,000 for the nine. Part of this was in cash and the rest was taken in young mules from the Miller & Lux ranches.

Miscellaneous.

The cattle supply is the biggest in years on the ranges in Butte county.

The American Can Company announces that government restrictions will prevent supplying cans for certain commodities. It is predicted that canned pork and beans will soon disappear from the market.

Solano county farmers have declared war on coyotes, the enemy of the sheep man. Farmers offer a bounty of \$20 for each coyote killed. This, together with \$10 offered by the county, brings a coyote scalp up to \$30 apiece.

Crops of volunteer oats, barley and hay growing on the right of way of the Southern Pacific lines in California and Oregon have been offered to farmers free of charge today by the vice-president and general manager of the company. It was estimated that more than 12,000 acres are involved.

\$2,000 for Shorthorn Cow and Calf.

The Carruthers Farms sale of shorthorn cattle, held at Mayfield, May 2, was very successful. Bidding on cows and heifers was spirited and they averaged nearly \$500. Bulls were lower. One cow and calf sold to T. T. Miller of Los Angeles for \$2,000. Full report next week.

A New Shorthorn Herd.

T. T. Miller of Los Angeles, for some years a successful cattleman in the Imperial valley, has entered the blooded cattle field. He expects to build up one of the best and largest shorthorn herds in the state. His initial purchases—thirty-nine head, two bulls and thirty-seven females—have just arrived and are on his ranch in the San Fernando valley. They mostly represent the much-prized Cruickshank strain of breeding. The two bulls with this his first shipment are both fine individuals and show high breeding. Diamond Choice, 398,183, was bred by Bellows Bros., Maryville, Mo. A Cruickshank's heads his herd. Greendale Sultan, 491,351, was bred by the Greenfield Plantation, Miss., sire Lapedeza Sultan, 406,929. This bull contains both the Sultan and Cumberland blood and is a handsome youngster.

Among the cows are noted Maxwaller Gloster, 245,144, dam thirtieth Duchess of Gloster, bred by Carpenter and Ross, Mansfield, Ohio; Matchless E., sire Proud Monarch, 398,386, dam Lovelace E., 509,608, bred by Geo. Ferguson, Salem, Ontario; Linwood Augusta 2d, sire Baron's heir, 370,199, dam Augusta 116th, 121,346.

Mr. Miller will add other cattle to his herd until he has one hundred head, after which he expects to sell his produce. He will enter the show ring this fall and show at the leading California fairs. Andrew Simpson, formerly with Bellows Bros., and who prepared the grand champion bull at the last International show in Chicago, has been secured by Mr. Miller as his head herdsman.

Twin Holstein Bulls

The Greatest Combination Milk and Butter Breeding Known Today

No. 1 and 2 Twins. Colony Zarilda Newman and Colony Zarilda Cornucopia—Born March 26, 1915.

Whose sire, Aaggie Cornucopia Newman No. 80744, son of Margie Newman, and grandson of Aaggie Cornucopia Johanna Lad, Jr., No. 36974, who is the sire of Lutscke Vale Cornucopia. Milk one year 31,246.9. Their sire has two-year-olds to give over 100 lbs. of milk per day, three-year-olds to give 117.2 lbs. milk one day and butter 29.53 in seven days. His first eleven daughters to freshen average per week of butter nearly 19 lbs. and over 460 lbs. of milk in seven days. He is sure to be one of the leading bulls of the breed.

They have for dam the wonderful performer, Zarilda Clothilde 3rd De Kol, whose record as a Junior four-year-old has never been equalled for one, seven and thirty days. She now is being tested semi-official and in her performance so far bids fair to be the world's record milk cow. She has been twice over 123 lbs. milk in one day, twice over 800 lbs. milk in seven days, twice over 3300 lbs. milk in thirty days, once as a Junior four and now at six years old. Milk ninety days 9940 lbs., butter 338.62, and her owners claim she will give over 33,000 lbs. in twelve months, and over 1200 lbs. butter. Buy these bulls, as it may be your last chance to obtain such a wonderful combination of breeding. For further particulars write

Breed Mares to Sound Draft Stallions.

[By Wayne Dinsmore, Secretary Percheron Society of America.]

Maximum crop production requires plenty of horses, men, and efficient farm machinery. Powerful draft horses do more to compensate for labor shortage than any other factor. Gang plows of two 14-inch bottoms, with five powerful draft horses, will turn five to five and a half acres per day; will, on a 20-wheel disc harrow cutting 9 feet in width in the field, disc 14 to 18 acres per day; and on a 20-hole disc seed drill will seed 18 to 20 acres per day, and cover it in the same operation. Only heavy draft teams can make such efficiency possible. Horses weighing over 1600 pounds each in working condition are needed, and five of them to each farm teamster employed. Where such heavy draft horses are not available, smaller implements are used, and the daily turnover in work accomplished per man falls to approximately half that which is being done by men with heavy teams and plenty of them.

The United States does not need an increase in mere numbers of horses and mules. It does need an increase in well-proportioned powerful draft stock. There is no danger of an overproduction of draft horses within the next ten years, nor is there any danger of an overproduction of good thick farm chunks weighing 1300 to 1600 pounds. The latter can be, and are being, produced by breeding common light mares of mixed blood weighing 900 to 1400 pounds each, to sound, well-proportioned Percheron stallions. Every mare of this kind should be bred to the best draft stallion available, and every draft mare should be bred to the best stallion within reach.

The demand for heavy draft horses is already far in excess of the supply. Prices have increased \$50 to \$75 per head, and the difficulty of obtaining the very best draft horses has been so great that city buyers have been obliged to purchase horses that are only three years old this spring in order to fill the demands of their trade. The best informed men in the market respecting city trade are agreed that draft horses will never be entirely displaced in our large cities, and that they have already reached what is practically a solid basis for the future.

The demand for Percherons has shown steady improvement within the past twelve months. Importations are practically nil, and the steady increase in demand for good draft horses gives promise of a most excellent future for the shrewd farmer who realizes the advantage of using Percheron mares in his farm work.

Exports of horses to Europe for war purposes from September 1, 1914, to March 1, 1917, totaled 853,116 head, valued at \$182,994,406; and 289,062 mules, valued at \$58,051,914. British army officers have given unstinting commendation to the grade Percherons which have been sent from this country to Europe for artillery purposes. The effectiveness of the Percheron has been so great that studs of purebred Percherons have been established in Great Britain in consequence.

The vast majority of the mares in the United States will be bred or left unbred within the next ninety days. All good mares should be bred to the best available draft stallions.

Barley to Hogs Every Day

[Written for Pacific Rural Press.]

If a pig is fed some barley during his entire life, J. L. Mendenhall of Colusa County believes it is possible to turn him off at 200 pounds on 400 pounds of ground barley and all the alfalfa he will eat, in 400 days. Mr. Mendenhall has been a large grower of hogs for many years in connection with his extensive grain farming, using his alfalfa land to grow out the pigs and finishing them on stubble in the fall.

In hand-feeding grain, to brood sows, pigs, and shoats, he emphasizes the value of fine grinding before use, setting his own grinder so that it will make a very fine meal. Before feeding, all barley is soaked in water 48 hours so that it is thoroughly softened and easily digested. After

a pig weighs 50 to 60 pounds, he is given a pound more or less of this soaked ground barley per day and run on alfalfa pasture. According to Mr. Mendenhall's experience, that is the most economical way of feeding market hogs under his conditions.

Pigs farrowed in January and fed this way till after harvest and then turned onto the stubble are always turned off at 12 to 14 months old weighing 175 to 225 pounds and commanding the best market price because of their prime condition.

Hog shade will soon be needed. Fix up shelters on posts or corners of the fences, covering with brush or weeds. Don't waste feed by giving it to hogs that suffer unnecessarily with the heat.

PACKERS TO PAY HIGHER PRICE FOR BETTER HOGS.

To the Editor: The committee appointed by the California Swine Breeders' Association to meet the Los Angeles packers and discuss ways and means of more satisfactory arrangements for selling hogs, have reported as follows:

"In order to discriminate between the market value of good hogs and poor hogs, it was agreed that 77 per cent should be fixed as a killing per cent basis, and all hogs dressing above 77 per cent shall be paid for with a premium of 10 cents per hundred weight above the market price for every point they dress out above the base per cent. Further, there shall be no cut in market price for hogs dressing below 77 per cent."

The Hauser Packing Company, the Wilson Packing Company and the Cudahy Packing Company of Los Angeles, and the Western Meat Company of San Francisco, have agreed to the above.

CALIFORNIA SWINE BREEDERS' ASSOCIATION,
J. I. Thompson, Secretary.

ORMONDALE SHORTHORNS

Golden Goods, Jr.,
Herd Sire.

Our 1916-17 offering of yearling bulls is small but select. They are all heavy boned, solid red in color and of Scotch and Scotch-topped breeding. Suited for either the range grower or breeder.

DUROCS.

Our Durocs are of the big type, with big bone, well-arched backs and carrying good hams.

We have a few head of service boars, now ready for service, solid red in color and out of prize-winning animals.

Every Animal Positively Guaranteed

Whether you buy or not, visit our ranch, 7 miles from Palo Alto on Woodside Road. We welcome inspection. Prices and pedigrees on application.

BASSETT'S POLAND CHINAS

GRAND CHAMPION SOW,
P. P. I. E., 1915; Sacramento, 1916.

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Young stock, \$30 Up.

Young Alfalfa Bloats Cows.

To the Editor: I have been pasturing my dairy cattle on alfalfa stubble all winter except when very wet. Usually I fed hay in the morning and did not turn them out until late forenoon. Two weeks ago I noticed signs of bloat for the first time. Am now out of hay and have kept cattle in yard until dew was off, but they still bloat some. Last week a heifer died within 20 minutes of the time bloat was noticeable. Two cows bloated but were soon relieved with soda and gags. Then one bloated and this treatment didn't work, so I stuck her with a trocar. The gas escaped slowly through the sheath, but a green liquid and semi-liquid kept clogging the outlet. The cow seems to be getting better. Please advise preventive measures, relief measures, and how to use the trocar.—C. J. B., Orland.

The young vigorous growth is causing the bloat. Give four ounces each turpentine and aromatic spirits ammonia in one quart of milk at one dose. If not relieved immediately use the trocar half way between the point of the hip and the last rib and an equal distance below the side point of the backbone.

Phosphorus for Milk Fever.

To the Editor: One of my neighbors came near losing a cow with milk fever. The cow was entirely paralyzed and expected to die at any moment. An old English doctor opened her mouth and injected some medicine in her tongue. In a short time the cow was up and is perfectly well and sound today. The doctor said he used phosphorus. Why is not this remedy mentioned in farm papers?—E. S., East Sound, Wash.

This animal would have been up by herself without treatment. Phosphorus would have no action which would relieve this condition.

Horse Has Scabby Itch.

To the Editor: A horse seems to have a humor of the skin. A scab forms and the hair drops off. Seems to itch. Feed hay and two gallons of barley daily. Have been bathing him with sheep dip.—O. D., Cloverdale.

Wash off the scabs with warm soap and water and dry. Then paint with Tincture of Iodine daily.

DR. T. B. SPALDING'S

Big Type, Prolific, Pedigreed Poland-Chinas.

Biggest and best blood lines of the breed. A Wonder, Big Bone, Smooth Price, Big Ben and Jumbo Fashion strains. Only tops tolerated on the ranch or offered for sale. Fancy gilts and boars. Mare Does Not Shed Hair.

To the Editor: A mare that I have had out on pasture all winter does not shed her hair. The skin is tight on her bones. A veterinary to whom I took her said she did not get enough to eat. He prescribed 30 powders, which helped her very much. Can you give me a recipe for something to make her shed her hair?—F. R. F., Stockton.

Have the following mixture put up: Fluid extract Nux vomica, 1 oz; fluid extract Gentian root, 1oz; fluid extract cascara sagrada, 1 oz; Fowler's solution, enough to make 12 ozs. Give one tablespoonful of this three times a day.

Bony Growth on Knee Cap.

To the Editor: A mare is lame in the foreleg due to bony growth on the knee cap. Liniment and blisters have no effect. The county veterinarian said he couldn't do anything for it—that it would wear away. It has been four months and she is no better. Has been on pasture most of the winter.—W. H. M., Woodland.

If a bony growth is interfering with the action of the joint it will have to be removed if possible or the animal will always remain worthless.

Hard to Pass Water.

To the Editor: One of my horses often tries to pass water; but with great difficulty passes very little.—J. M. S., Blocksburg.

Give one ounce potassium citrate at a dose and repeat as needed.

HOG CORRALS IN ALFALFA FIELD.

On the Joseph Wilson ranch in Lyon county, Nevada, is a four-acre field of alfalfa planted last spring.

Mr. Wilson intends dividing the patch into eight equal pens for his purebred Berkshire sows and litter.

Each pen will have a colony house and self-feeder, with the alfalfa furnishing plenty of green feed.

There happens to be a good supply of gravel on the piece, which will do much toward keeping the feet worn off.

Among the Wilson herd are three excellent sows, all prize winners at the Nevada State Fair, 1916.

Mr. Wilson expects much from his boar, Robinhood Laurel 10th, which will be shown at the coming California and Nevada State Fairs.

Select a dairy cow with a large feed capacity. This is indicated by an enormous paunch, long ribs well rounded and long space between the last rib and the hip bone.

A poor milker may cause as much loss to the owner of a dairy as a poor cow.

A GALLED HORSE MAKES NO MONEY

But a healthy horse, with shoulders free from galls, bruises or sores, does better work, makes money for you—besides you feel better about it, as well as the horse.

Cheap Shelter for November Lambs.

[Written for Pacific Rural Press.]

W. G. Records of Inyo county has fenced off a 100-foot square adjoining his sheep pasture with 6-foot 2-inch mesh wire fencing. Another fence of similar wire will encircle the lot, the second being placed on the inside of the posts, thus having a double fence about five inches apart. This five-inch space is to be packed with straw and will form the outside wall of the shelter or shed.

The 8-foot "straw and dirt" roof will slope inward to within three feet of the ground, the frame and

rafters being made of rough cottonwood boughs. This shelter, being closed on all sides, will afford excellent protection for the November lamb crop. *

Mr. Records' main idea for having the lambs come in the fall is that he is able to market them in the spring, when they are usually high; and he secures the service of his neighbors' bucks free of charge, since they do not wish to use them at that time. Mr. Records had lambs, born last November, that would dress out 30 pounds in March.

Big Tamworth Herd.

[Written for Pacific Rural Press.]

About the largest herd of Tamworth hogs in the State is that of H. E. Betts of Holtville, who keeps about 100 sows all the time. The herd header is Swineland King 2nd sired by Nimrod 3rd and out of Hazel M. 2nd. The 25 sows which

had farrowed since February averaged over 8 pigs.

Mr. Betts uses no wallows for his hogs. The drinking water is given in self-filling cups just large enough for each hog to get his head into. Eight of these cups are fastened around the base of a barrel set on a platform which raises the drinking cups just hog high.

Feeding troughs are of the station type.

Farrowing houses are portable, 7x9 feet. All 15 of them are in a row and all are covered again by a fly roof thatched with arrow weeds.

STATISTICS OF TUBERCULIN TESTS.

Following is the report of State Veterinarian Keane of tuberculin tests made by him under the new state dairy law:

TOTALS FOR MARCH.

Number of herds tested	579
Number of herds containing 10 animals and less tested	444
Number of herds containing 10 animals and less free	341
Number of herds containing more than 10 animals tested	134
Number of herds containing more than 10 animals free	18
Number of animals tested	5,576
Number of reactors	1,114
Number of suspicious	136

TOTALS TO APRIL 1, 1917.

Number of herds tested	1,962
Number of herds containing 10 animals and less tested	1,479
Number of herds containing 10 animals and less free	1,181
Number of herds containing more than 10 animals tested	482
Number of herds containing more than 10 animals free	91
Number of animals tested	21,083
Number of reactors	3,817
Number of suspicious	428

UDDER TROUBLES.

Sometimes a cow is difficult to milk because the opening in the teat seems too small. Get a milk tube, sterilize it and press into the opening so as to draw off the milk and stretch the orifice until it is large enough for a full flow. Sometimes a cow has a hard lump in the udder. Rub it every third day with a mixture of two drams of iodine in two ounces of lard until the lump disappears. Often when a cow is hard to milk or holds it up she will come all right from feeding a little bran or grain, as this diverts her attention from the nervous action which is the source of the trouble. When the calf comes, care in milking will prevent the milk fever. In case of attack pump air into the udder with a bicycle pump.

As a rule a heifer cannot be milked as rapidly as an older cow, but she should be milked just as thoroughly.

100 THE QUALITY SALE 100 Registered Holsteins

The sale at which you can strengthen the best herd in the State or secure the foundation for a high class herd. An especially choice selection of heifers will be offered in this sale, including

A Daughter of Spring Farm Pontiac Cornucopia out of a 31-pound dam that is a candidate for a big record.

A Daughter of King Korndyke Saddle Vale, the only 40-pound bull that has produced a 40-pound daughter.

A Daughter of King Segis Pontiac, whose sons have commanded the highest prices in the United States and Canada.

A. B. O. Cows and Heifers bred to King Pontiac Segis Korndyke, a 30-pound son of King Segis De Kol Korndyke.

Splendid Heifers bred to King Segis Alcartra Abbekerk, a 30-pound son of the \$50,000 sire King Segis Pontiac Alcartra.

Great Heifers bred to Supreme Glista Pietje, son of Woodcrest Pietje Ormsby and a 32-lb. daughter of Prince Yoma Snofford 6th, who has a greater percentage of 30-pound daughters than any other bull living or dead.

BULLS

Young sires of real herd heading quality will be sold in this sale, out of dams with great semi-official records and 7-day records up to over 30 pounds butter.

Raising Poultry for Profit

DUCK FARMING.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

When properly fed, ducks make the quickest returns of anything in the line of feathers. While they eat more than chickens, in the growing stages, they will get along very nicely on coarse feed, provided they are supplied with animal food. Quick growth can never be gotten in ducks without the latter. And if it is possible to plant a patch of rape or other succulent green feed near where the ducks are to run, half the labor and feed bill can be cut off.

Duck raising is adapted more to the general farm than to the small place where room is precious.

The income from ducks may be divided into three parts, just as with other poultry, eggs, meat, and fancy.

If a person goes in for raising green ducks for market, room is not so much a matter of concern as is cheap litter and animal food. To get his ducks up to size and weight, they must be kept warm and have an abundance of animal food all the time during their short lives.

If the ducks are to be raised for eggs, it is best to be particular about getting a variety that will lay white eggs and also plenty of them. For this purpose a good pasture and an easy access to water is a great saving in time and money. If a pasture is not to be had, the next best method of keeping ducks for eggs is by making double yards. These need not be very high, three feet high is more than ample, the first yard need not be very large either, if the house is permanent. A better plan is to make the yards equal in size and have a portable house that can be moved from one yard to the other. While the green feed in one yard is being consumed, that in the other yard is growing. Of course, it is necessary to plant some quick growing green such as rape, oats, barley, or wheat.

I find that more people err toward underfeeding. One article of food, no matter how good it is, does not make a balanced ration for poultry or ducks.

Laying ducks need at least one feed a day of mash in which they receive a day's ration of animal food, beef-scrap, fish-meal, etc. At night they should receive a little dry grain, oats, barley, wheat, or cracked corn. In addition to the two meals a day, laying ducks, with a green run, should be supplied with sand, fine oyster shell, and plenty of water at feeding time in dishes in which they can wash up to the eyes well. This prevents them having sore eyes from the feed sticking on the feathers.

April and May are the best months to hatch for laying ducks, so that anyone who wants to try, and thinks it is too late, has yet time to get in the race.

HATCHING DUCK EGGS.

Of course there is not anything quite so good as a good motherly hen, with back-bone enough to set a whole month, but these hens are not always to be had; and when they are not, the incubator will do next best. The only difference be-

tween hatching duck eggs and hen eggs is that the heat should be kept a little lower for at least two weeks, after which it can be 103, and more moisture given. A pan or two of wet sand the last few days gives better results in rotting the shell than when the water is applied direct to the eggs. It is not necessary to drown the ducklings in order to apply moisture, but just keep the air in the incubator moist.

After every hatch, the incubator must be thoroughly sprayed and cleaned, as ducks cause a bad odor in the incubator and this would give the next batch some trouble.

As to varieties, the Indian Runners, when well bred, have been called the Leghorns of the duck family. They mature early, so can be hatched just a little later than the Pekin, which requires a longer season to reach full maturity. The Buff Orpington is a large duck and lays a white egg, and the claim for it is that it lays as early as the Runner.

SOME TURKEY DISEASES.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Young turks in a natural state do not have many troubles, but as soon as we begin to feed and pamper them they have just as many troubles as chicks, and the troubles generally end in a much greater percentage of loss.

Err on the light side instead of the heavy side of feeding. I have seen strong healthy young breeders, just off the range, shut up in a house and fed corn. In two weeks they were dead. These were one year old too, and had been raised right. Shutting in close quarters is always a risk, but the shutting up is made worse by wrong feeding.

Owing to the habits of young turks, they are very apt to get colds in the head and eyes, so that catarrhal sore eyes and canker are about the first things young turks are troubled with. The eyes should be bathed in a rather strong solution of peroxide of hydrogen, and the canker, if it occurs in the mouth, head, or eyes, may be treated easily. Take a flat stick or some blunt instrument and scrape the cheesy lumps off and apply a little alum, a little powdered blue-stone or a weak solution of carbolic acid and water. If the latter is used, take care to not allow the water to run over well and healthy skin.

The next thing which gets turkeys, or perhaps one should put it first, is lice. They seem to attack

RECIPE FOR TOE-PICKING.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

One of our subscribers sends in a recipe for toe-picking. This is to feed a milk mash that costs \$3.90 cents a sack. This must be gotten from Portland, Ore., so I don't think many will want to try it. Besides there is no need of it. A bare teaspoonful of salt in a quart of water will stop toe-picking. The only thing to remember is to not repeat the dose of salt and water but just once.

Too much salt and water causes indigestion. It is not a thing to be

given in repeated doses, nor is it needed, for one dose is enough. If the chicks begin again in, say a week after, why they can be given another dose and by that time they will forget all about it.

POULTRY QUESTIONS.

[Answered by Susan Swaysgood.]

TOO EARLY FEATHERING.

Last year I lost 75 per cent of Black Minorca chicks by feathering out too young. After two weeks old, they would droop their wings and die. I feed chick feed and milk with some green grass.—O. C. H., Lodi.

Dry chick feed and milk will never cause chicks to feather out too soon. Probably you keep them too warm. Lower the brooder heat and harden the chicks. Your feed is fine for bone and muscle.

HENS DO NOT LAY.

I have 100 White Leghorn hens a year old and others two years old. They lay only two or three eggs a day. Feed a waterbucketful of wheat per day and have plenty of gravel, green feed, and sour milk.—B. H., Dos Palos.

Feed a little commercial mash with beef scrap or some animal food in it. They need more than wheat to bring eggs. You should be getting 75 eggs per day.

Poultry Breeders' Directory

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

BABY CHICKS—For May and June. We will have them—Barred Rocks, R. I. Reds, Black Minorcas, White and Brown Leghorns. They cost from 7 to 12 cents each, depending on breed and number. The combination is good quality and low price, because our plant is efficient, our hatching capacity is large, so we can operate on a smaller margin of profit and give good value for the money. Try us with a trial order. Our breeds are pure-bred and of the true utility class, bred for layers and hardiness. Don't quit because grain is high—Eggs will be higher, and the laying hen is a good investment. Write for our circular and price list. Roofden Poultry Ranch and Hatchery, Campbell, Cal.

BARRED PLYMOUTH ROCKS—COCKERELS—Cockerels—Cockerels—Yes, we have them; also Hens and Pullets—all bred from our Champion Winners at California's leading shows. Also hatching eggs. If it's Barred Rocks you want, get in touch with me right away. Have bred them exclusively for nine years. Send for Catalog. Chas. H. Voden, Box 396, Los Gatos, Calif.

"FINEST HATCHERY IN THE WORLD"—Baby Chicks, White Leghorns, and Rhode Island Reds, settings, 190's, 1900's, hatched right in our \$60,000 brick and concrete hatchery from our quality heavy layers. Reasonable prices. Stock, Hatching Eggs. Pebbleside Poultry Farm and Hatchery, Sunnyvale, California.

MAY AND JUNE CHICKS—Will lay this fall if from our early maturing strain. Our Leghorns and Reds begin laying at 4½ to 5 months. Leghorns, \$10 per hundred; Reds, \$12.50 per hundred. Brooke Farm (Rancho del Paso), 807 J St., Sacramento, Cal.

PRIZE WINNERS—Houdans, Barred Rocks, buff, black, white Orpingtons; black Langshans; R. I. Reds; Silver Laced Wyandottes. Settings, chicks, cockerels. Trio Indian Runner Ducks—laying—\$5. C. L. McGee, 1635 Julia St., Berkeley.

BABY CHICKS—HATCHING EGGS—White, Buff, Brown Leghorns, R. I. Reds, Barred Rocks. Sturdy chicks from well-mated fowls. Prompt, efficient service. Write for circular. Campbell Poultry Ranch, Campbell, Cal.

HOGANIZED AND TESTED—320-egg type White Orpingtons and Buttercups. Hatching eggs, chicks and cockerels for sale. Reasonable prices. For particulars, write M. Woodhams, San Mateo, Cal.

S. C. RHODE ISLAND REDS—220-egg record in 12 months. Hatching eggs, Chicks, Stock. Also Rose Comb Reds. Mating list ready. Wm. Larm, 3915 39th Ave., Fruitvale, Cal.

WHITE WYANDOTTES—Persistent layers and Blue Ribbon winners. Eggs now \$1.50 and \$3.00. Chix 20c. E. W. Stawetski, Route 2, San Jose, Cal.

BABY CHICKS from S. C. White Leghorns from trapped hens with records from 192 to 297 eggs. Also S. C. Black Minorca chicks and eggs. J. W. Benoit, Route C, Modesto, Cal.

HICKS JUBILEE HATCHERY, Petaluma, Cal.—White Leghorn and Black Minorca chicks and hatching eggs. Circular "How to Raise and Feed Chicks" free.

EASTMAN'S BRED-TO-LAY Barred Plymouth Rocks—chicks, eggs, cockerels. We hoganize and trapnest. Fairmead Poultry Farm, Fairmead, California. Box P.

MODEL POULTRY FARM—White Leghorn specialists. Our thirteenth year. Baby Chix and Hatching Eggs for sale. W. C. Smith, Prop., Corning, Cal.

INCUBATORS—For Essex Model Incubators at factory prices, write Geo. H. Croley Co., Inc., Poultry Supplies, 631-637 Brannan St., San Francisco.

ANCONAS—First-class stock. Reduced price, \$2.50 per fifteen. Chicks, 25c each. Few choice birds for sale. J. R. Bell, Livermore, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 645 W. Park St., Stockton, Cal.

BLACK MINORCAS—Largest egg; whitest flesh. Eggs, \$1.00 per 13; \$5.50 per 100. Edward A. Hall, R. F. D. 1, Watsonville, Cal.

HATCHED CHICKS from Barred Rocks, R. I. Reds, White Leghorns. Good stock. Send for circular. G. L. Hawley, Madera, Cal.

WHITE PLYMOUTH ROCKS—Hatching eggs from splendid layers. Mrs. J. B. Tupper, Route A, Ceres, Cal.

RHODE ISLAND REDS—Eggs, \$1.00 for 15. P. M. Cox, Sonoma, Cal.

TURKEYS, DUCKS AND GEESE.

COLORADO MUSCOVY DUCKS—Quiet, quackless. Weigh up to 10 lbs. Good layers. Eggs, \$1.00 for 12. P. M. Cox, Sonoma, Cal.

MAMMOTH BRONZE TURKEY EGGS—During May at \$2.50 per 10, \$20 per 100. M. M. Reiman, Planada, Cal.

FOR SALE—Mammoth Bronze Turkey Eggs. Eastern stock prize winners. Mrs. Robert Farrell, Bolinas, Cal.

BRONZE TURKEY EGGS—By the setting or hundred. Also fine young Toms. Albert M. Hart, Clements, Cal.

MAMMOTH BRONZE TURKEY EGGS—\$3.50 per setting. Toulouse Geese eggs, 25c each. Mrs. M. Coghlan, Walnut Creek, Cal.

VICTOR BROODERS—Better Than a Hen. Defeated all other makes at P. P. I. E. Heat evenly distributed over all chicks. Chicks don't crowd, trample and smother each other. Safe to operate. VICTOR BROODERS raise more chicks than a hen, carry no lice, make no cripples. Raise your chicks with VICTOR INCUBATORS and BROODERS. Keep the hens laying. Ironclad guarantee with machine. CASES AND CAMP KITS.

Dear Friends: With all the war agitation summer vacations are not receiving much consideration, but I saw in some special leather shops this week most attractive things for the traveler, some of which would make nice gifts for men entering the army.

There are traveling cases of leather which fold or roll up. Those designed for women are filled with Parisian ivory conveniences. One that was exceptional value for \$5 had a hand mirror, soap box, tooth brush case, powder receptacle, a hair brush and comb, a button hook and nail file. These are fitted into special places, so when packing up, nothing is forgotten if all the spaces are filled. Some of the larger cases buckle loosely enough that a night gown may be folded up on these toilet articles and one night's necessities are carried in one compact case. These outfits vary in expense as to quality of leather, lining and fittings. For men, there are the most convenient cases of black fittings, holding military brushes, shaving stick, razor, bottle for lotion, tooth brush, comb, clothes brush and flat mirror which will either hang or stand. More expensive cases are even more completely fitted out. These are almost invaluable to a man who travels, for he has everything at hand and in its place. This would make an appreciated gift to any man away from home.

Then also, in leather cases come bottles for small portions of medicine, flasks, leather-covered, collapsible drinking-cups, poker chips and playing cards in strong cases, pocket manicure sets and baggage tags.

Six small clothes pins, two glass-headed push buttons and a card of heavy twine is a novelty in a red leather case for the traveling woman's clothes line. These make dainty gifts and may be purchased for 50 or 75 cents.

Collar cases of leather with leather lining are very popular now for a gift to brother or father. They are round, the size of a collar, and stiffened around the sides for two inches to protect the collars. The top of the bag pulls together with a cord, and a pocket provides a place to keep studs and buttons.

Emergency cases make very useful gifts. One about six inches long, two inches deep, and four inches wide does not take up much room and holds most important things, among them being ointment, adhesive tape, scissors, court plaster, gauze, and five bottles in a separate compartment. Such a case may be purchased for \$2.50. For the traveler sewing kits are most important and the roll seems far more satisfactory than a bag from which things are so easily lost. For a woman, one about eight inches wide and twice as long, of cretonne or silk is good. Across one end the spools of cotton, silk and darning cotton are fastened by running tape through the holes and fastening the ends down firmly to the material. This allows the thread to unwind without removing the spool. Next a strip of flannel, pinked around the edges, holds the

needles and darning. The scissors, held down by two straps, fit in well next, and a pocket for buttons, hooks and eyes, and snappers follows. Another strip of flannel is filled with assorted pins and safety pins. On the end of the strip is made another flat pocket for tape, thimble, and anything else. Flaps are applied on the sides which fold over and protect the contents. This all rolls up snugly and is tied with ribbon or tape fastened to one end. This same plan is excellent made of khaki cloth, with stronger materials for camping use or for the soldier boy. Such a kit has been supplied to the American Ambulance Corps men leaving for France.

The safety button of metal, which is not sewed on, but clamps from the back with another piece of metal, has found great favor among the boys on camping trips.

ROSABELLA BEST.

SAMPLE MEALS FOR FAMILY OF FIVE.

The food materials indicated as being required may be combined into three meals in many ways. The following meals are given not because they are recommended above many others that might be prepared, but simply to show that such foods can be combined into dishes commonly used in American homes. These meals supply during the day all of the eight essential substances and also provide flavorings and condiments which, while not important as sources of nourishment, add to the attractiveness of certain foods.

BREAKFAST.

Fruit—1½ pounds of fresh fruit (equivalent to 3 medium sized oranges, 5 small apples, or a quart box of strawberries), or 3 or 4 ounces of dried fruits (equivalent to 10 or 12 dates or 4 or 5 figs). Cereal breakfast food—4 ounces before being cooked, or about 1½ pints after it is cooked. The equivalent in food value in puffed or flaked, ready-to-eat cereals would be 5 or 6 cups. Milk on cereal—¼ cup for each person. Sugar on fruit, on cereal, or in coffee, 2½ level tablespoons or 1¼ ounces. Bread—8 slices or 8 ounces. Butter—1½ ounces, or 2½ cubic inches. An egg, or 2 ounces of meat, fish, or poultry for each older person, and a glass of milk for each young child.

DINNER.

Meat, or fish—¼ pound for grown person; or, for each child, an egg or a glass of milk. Potatoes—(5 medium sized), 1¼ pounds. Another vegetable—(turnips, spinach, corn, cauliflower, or other), 1 pound. Bread—8 slices, or 8 ounces. Butter, 1½ ounces, or 2½ cubic inches. Steamed apple (or other fruit) pudding—(Ingredients: Two cups flour, 2 tablespoons butter, ¼ cup milk, 4 apples, 1 tablespoon sugar). Sauce—(Ingredients: One-half cup sugar, 1½ tablespoon flour, 2 teaspoons butter, ¼ cup water, flavoring).

SUPPER.

A gravy made out of 1 pint of skim milk, ¼ cup flour, 2 level teaspoons butter, and 4 ounces salt or

smoked fish (just enough for flavor). To this can be added the egg yolk left from the frosting of the cake. Rice—8 ounces, or 1 cup, measured before being cooked. Bread—8 slices, or 8 ounces. Butter—1½ ounces, or 2½ cubic inches. One-half of a cake—(Ingredients for whole cake: One-fourth cup butter, ½ cup sugar, 1 egg, ½ cup milk, 1½ cups flour, 2½ teaspoons baking powder.) Frosting made with 1 egg white and ¼ cup sugar.

Don't Waste Food.

In these stirring times of war preparation we receive warnings from everywhere not to waste our food supplies. The following excellent and practical hints are condensed from a circular issued by the United States Department of Agriculture:

Keep all perishable food cool, clean, and covered.

Dry cold is a much better preservative than damp cold.

The particles of dust floating in the air carry molds and germs.

When meat, fish, milk, and eggs are allowed to become warm they begin to spoil rapidly.

Disease-producing germs and bacteria multiply very quickly in slightly warm food, rendering it dangerous to eat.

Don't keep perishable foods in a hot kitchen or pantry, or in a sunny place any longer than you are obliged to.

Meat, fish, and milk afford ideal breeding grounds for disease germs. Keep these foods covered so that such germs may be excluded.

FLY-KILLING TIME.

This is the time of year to wage a war on flies, for every fly killed now means many less in the summer. See that all fly-breeding places are cleaned up. The fly has no equal as a germ-carrier—it is widely believed that it is the carrier of many diseases. Especially in households where there are small children should there be much care taken to destroy flies.

The United States Government recommends the use of formaldehyde and sodium salicylate for the destruction of flies. Three teaspoons formaldehyde to a pint of water is the correct proportion, or three teaspoons of powdered sodium salicylate to a pint of water. This can be poured upon blotting paper and has the advantage of being attractive to flies and not a poison for children.

FEATHER DUSTERS.

Feather dusters should never be used in the house for dusting, for they do not get rid of the dirt, but simply spread it. The best use for a feather duster is to have it hanging by an outside door to brush off the dust from the shoes before entering the house. For dusting inside, there are especially treated cloths, or one can be made by dampening cheese cloth with a furniture polish and allowing it to dry before using. This sort of cloth takes up and holds the dust.

Floral Department.

CHEMICALS FOR WEED KILLING.

Here is an article from the Florist's Review, that may be of interest to my readers, entitled "Weed Eradication":

BY MEANS OF CHEMICALS.

In the spring when the grass begins to grow, the florists' customers ask for advice on weed eradication, from lawns, drives and walks. Of course the florist who does garden work is prepared to tackle the job, or at least to supply the weed killer, but many who are called on only for advice do not seem to appreciate that one of the most efficient methods of weed eradication is by means of a chemical spray, which kills the weeds without injury to the grass, it having been found that all plants with broad leaves will be destroyed while the narrow-leaved plants will not.

IRON SULPHATE FOR LAWNS.

The use of chemicals for weed eradication has been successfully employed at the Missouri Botanical Garden, and it has been found that the one which is most efficient and which causes no injury to the grass is iron sulphate. It should be applied to the lawns by means of a compressed-air type of hand sprayer or a traction or cart sprayer, depending upon the size of the lawn. Sufficient pressure to make a fine spray is necessary, for too much solution at one place may cause injury to the young grass shoots just beneath the surface, which have only a slight power of resistance. If a hand sprayer is used it should be fitted with three feet of compression hose and a three-foot extension rod for swinging the nozzle over the lawn. The solution is made by dissolving two pounds of iron sulphate in one gallon of water, and, to be effective, lawns should be sprayed five to six times during the season, in order that each set of new leaves may be destroyed as they appear. The solution should be applied on bright days, for if the rain comes too soon after spraying it may wash off the iron sulphate before it has had a chance to act. It is not advisable to spray until two or three days after mowing, and the grass should not be mowed until two or three days after spraying. Care must be taken not to get the solution upon clothing or stone walks, on account of discoloration.

OTHER CHEMICALS FOR LAWNS.

Copper sulphate is sometimes used in a similar way to that described for iron sulphate, except that, as it is about ten times as destructive as iron sulphate, the solution should be weaker—about eight to ten pounds of copper sulphate to fifty gallons of water.

Ammonium sulphate, though sometimes used in small quantities as a fertilizer, has been applied to lawns in larger amounts, mixed with such inert material as sand, for the destruction of broad-leaved weeds. This chemical generally forms the basis of the commercial "lawn sand" and when spread upon the lawn checks the growth of all vegetation. However, the grass soon recovers, and, through the stimulus received, produces luxuriant growth, choking out the weeds.

WHERE NO VEGETATION IS WANTED.

For walks, roads, tennis courts,
and all places where complete and
lasting extermination of all plant
life is desired, other chemicals are
used. The most important of these
is arsenate of soda. This is a most
active poison and care must be exer-
cised in its use. Two pounds to ten
gallons is the formula employed. The
solution may be applied with a
watering can, using care not to get
too close to valuable trees.

Carbolic acid is a powerful and
quick-acting weed killer, but its
effects are not so enduring as those
of the arsenical solution. The for-
mula is one pint to four gallons of
water. Salt also may be used, in the
form of a hot brine, the solution be-
ing strong enough to show crystals
forming on the surface. Better than
carbolic acid or salt, however, for
the destruction of woody plants, like
poison ivy, is caustic soda—either
sodium hydrate or sodium hydroxide.
It should be applied hot in practi-
cally a saturated solution, during
dry weather. After the destruction
of the weeds the soil should be thor-
oughly watered, in order to wash
out the soda and permit other vege-
tation to grow.

Good Health.

[By H. E. Pastor, M. D.]

Alopecia.

We hope our rural readers will not
take fright at this unfamiliar head-

ing. In the lingo of the learned it
merely means bald-headedness. There
comes a time in the lives of nearly all
who pass the meridian of life when
the thinning locks become a matter
of some solicitude. A friend whose
bushy bangs began to fade away a
decade or so ago, once dropped into an
old darkey's chair in a barber shop in
New Orleans. This venerable darkey
owned up to 80 years, and claimed
an experience of 60 years in shaving
and shearing. "Here's my chance,"
thought my friend. "Uncle," he said,
"you must have learned some valu-
able things in your long experience.
What's the best thing to keep hair
from falling out?" "Thar ain't no
such thing," he said, and much more
to bolster up his belief. And so it is.
There is no preparation which will
promote the growth of the hair when
the hair-follicles are dead. Hair
restorers are a delusion and a sham,
and that bald patch will grow grad-
ually balder and balder, even if you
bathed in a tubfull of hair restorer
morning and night. Keep your scalp
clean when you are young, massage
it frequently and thoroughly, expose
it to the sunshine as much as possible,
don't wear hats with tight bands or
no hats at all, and keep up the gen-
eral health. But hair is like health—
You don't think much about it until
you've lost it, and then your think-
ing doesn't do you much good.

Water from shallow dug wells is
usually polluted. Farmers should
examine their supply occasionally.

The high record, trap-nested hen, the A.R.O.
cow, the well finished steer, the well grown
colt, the prize hog:

Whatever you raise that's a bit better than the
ordinary, is worth an auto-photo-graphic record.
And you can make such a record, with the data
on the negative. It's a simple, permanent, inex-
pensive and almost instantaneous process with an

SAN FRANCISCO.

San Francisco, May 2, 1917.

WHEAT.

The resumption of offers on Northern Bluestem wheat was about the only notable development in the past week's market, as the further advances on the other varieties quoted had been already forecasted. The Bluestem and Northern Red varieties top the market at present with as high as \$4.90 asked for good stock. Offerings on the sample tables and the street here continue light, and shippers have a hard time in filling orders of any size.

BARLEY.

Business in spot barley has been decidedly quiet during the past week, mainly the result of the scarcity of offerings in local dealers' hands, and this gain offerings is unchanged from last week. There was some advance on futures noted, but would-be speculators are buying very lightly until they can become better informed as to the attitude which will be taken by the Government in this matter. However, it is generally believed here that most of the exchanges in the United States will follow the lead of the Winnipeg Exchange last Saturday and prohibit any trade in futures.

Shipping, ctl.Nominal
BrewingNominal
Choice feed, ctl.\$3.00@3.15

OATS.

While local holders of oats are very firm in demanding the present quotations, very little trade has resulted, and a share of the trade here looks for easier prices on this grain within a short time. Some sales of small lots of white feed oats at \$3.10 per cental were reported, but these were for very small lots and were not heavy enough to make a market at that level. Present asking figures are too high to attract any shipping business.

Red feedNone offered
White\$2.90@3.00

BEANS.

While the market continues very firm, local trade was not so active this past week, and not all of the varieties now offered here met with a further advance in price. Limas were most in demand and are sharply higher, with a top of \$16.25 being freely paid for small lots. Black-eyes are 25c a cental higher and the range on garbanzos has assumed narrower limits. This is occasioned by the practical cleaning up in this market of the smaller sizes of this bean. Efforts on the part of brokers to close contracts for futures still continue, and it is reported that the higher prices being offered at this time are responsible for more farmers passing control of their crop. Those of the brokers who are believed to be representing foreign governments are particularly active, and it is believed here that the present crop will come far from supplying the demands made on this country for beans.

CORN.

With local offerings confined to two varieties, prices on corn naturally stiffened during the past week, and trade has slowed up very noticeably. The bulk of the sales have been in small lots, with California yellow in sacks bringing \$3.50 and Egyptian \$4.20. One concern that has a good sized lot of corn on hand is holding for \$5 on its Egyptian stock.

(First-hand prices on strictly first-class grain, San Francisco.)
Eastern Yellow, ctl., bulk.....Unsettled
California, sacked\$3.45@3.50
Milo MaizeNone offered
Egyptian\$4.10@4.20

HAY.

Last week saw a halt in the steady upward movement in hay prices, but the local market remained very firm at current quotations. Arrivals were but 1,220 tons, as compared with 1,378 tons for the week before and 1,589 tons for the week before that. As was the case during the preceding week, receipts were again practically all Northern Hay, and this variety was advanced \$2 per ton here. Some improvement was reported in the green feed situation, although this betterment in market conditions was largely in the irrigated sections. Rainfall was reported in a few scattered northern sections, but in most of the California haying sections the past week has been very unfavorable to growing stands. A peculiar situation exists here in that the Oregon and Washington sellers, who formerly owned the hay arriving here, at present are now trying to purchase this stock back at advanced prices. They have found themselves oversold. However, there is little or no chance that this shortage can be relieved until the new crop alfalfa hay is here in marketable quantities.

POTATOES, ONIONS, ETC.

The general trend of quotations in this market during the past week were downward, largely the result of more plentiful supplies. The daily receipts of asparagus are now so heavy that quotations locally are per box, the present range being \$1.25@3.00. The canners are paying the lower end of this range for white, while some off-grade lots of green stock are going to these interests at \$3@3.50 cents per box. Peas are also more plentiful, and bringing \$1.50@2.00 per sack, with both string and wax beans commanding 10@15 cents per pound. Summer squash is arriving in quantities larger than the trade will handle, and will not command more than \$1.25 per box. New potatoes are coming to hand in larger amounts and garrets will not command more than 7 cents per pound.

POULTRY.

Quotations on some lines advanced during the past week, with others falling off under very heavy receipts. Young roosters made the most notable gain, with old roosters, large sized broilers and small Leghorn hens registering an easier tone. Live turkeys are nearly nominal, so little interest is being shown at the present time. However, good young live birds will command as high as 22 cents per pound. Both ducks and geese declined during the week. Turkeys, live, lb.20@22c

BUTTER.

The butter market has ruled very steady this past week, and the closing day's trading carried the extras grade up a half-cent over the opening. Shipping business has been responsible for this better tone here, as most of the local dealers consider the present figures too high to warrant the beginning of storage as yet. At present there are some 17,000 pounds of butter in

storage, but this is all intended for government contracts and will not remain in the icehouses more than a month at the longest. Los Angeles again entered this market, as Southern receipts were unequal to the demand on several days. Portland and Seattle houses were also buyers and five cars of California butter were sent East last week.

Prime 1sts32 1/2 32 1/2 32 1/2 32 1/2 32 1/2

EGGS.

All grades of eggs closed the week at a higher level than on the opening day, a good local consumption and fair shipping business combining to steady the market here. Entries into storage were not so heavy as on the preceding week, local icehouse holding at present being 65,000 cases as compared with 63,250 cases at this time last year. Three cars of California stock went East last week, but the bulk of the shipping was coastwise. A large order also went out for Hawaii. The present local situation can best be described as steady to firm.

CHEESE.

There has been a markedly firm tone ruling trading in cheese during the past week, and all of the quoted varieties advanced. Jack cheese is in especially good call and is commanding as high as 25 cents per pound on street sales. The San Francisco Exchange last week voted to drop the quotations on New York, Wisconsin and Oregon cheese owing to the light trading in these grades on Change.

BERRIES.

Heavier receipts of northern berries and the daily shipment of nearly a straight car of southern berries has served to break the market here during the past week, and all offerings are lower. During the week it was announced that the California Packing Corporation had closed

with the Growers' Association to handle all of their surplus this year, but officials of the Packing Corporation say that they are not ready as yet to announce their stand.

LOS ANGELES.

Los Angeles, May 1, 1917.

BUTTER.

Receipts of week ending May 1....324,410
Receipts of past week.....233,470

The decline of last week brought prices down to a point that encouraged a greater local consumption. Receipts were very good, better than the same week last year, and the stocks of butter in cold storage here is now 14,037 pounds heavier than this time last year. Prices, however, up to Monday showed no change, it being a 33c market for extras up to Monday both here and in San Francisco. Still prices are 7c higher than this time last year. In Chicago extra creamery declined 1c up to Monday under the influence of increased production in the Central West, it dropping from 39c the opening of our review week to 38c. In New York, on the other hand, the market is 1c higher on extras than a week ago, it being quoted there now at 42 1/2c. Tuesday brought no change. Receipts were light, but San Francisco was unchanged. Chicago was up 1/2c on extra, while New York was down 1 1/2c. On call there was no bids or offerings.

EGGS.

Receipts (railroads) or week ending May 1, 1917, 3,411 cases.
Receipts (railroads) for week ending May 1, 1916, 3,629 cases.

There was a firmer tone to the market the past week and more life to the trade. Receipts were only fair and lighter than the same week last year, while the Eastern markets all stiffened up again. This caused cold storage people to enter the market again and they made fair purchases and there was a very good consumption demand, as eggs at present prices are cheaper than meat. The free marketing of hens by the poultry people in the country on account of the high price of feed, it is also thought, must have an influence upon the later supply of marketable eggs, hence a willingness to store eggs at present prices and the higher market for extras. Tuesday the market on call was a cent lower on extras, but up 1/2c on case count. Pullets unchanged.

POULTRY.

Receipts the past week were liberal of light broilers and light hens, they both being a drug upon the market. The continued high price of feed causing chicken raisers to rush this class of their holdings to market. The result was a further break in prices and sales were slow at the decline. Heavy hens also lost a little in sympathy. Fryers have also been marked down, though they and heavy hens met with a fair demand. Turkeys and ducks steady and in fair demand. Not many coming in.

We quote from growers:
Broilers, 1 1/4 to 2 lbs.20@21c
Fryers, 2 1/2 to 3 lbs.25c
Hens over 4 lbs.18@19c
Hens under 4 lbs.14@15c

Turkeys, light15@16c
Squabs, live, per doz.\$1.50@3.00
Dressed3.75@4.85

HAY.

The market the past week was quiet and weak. Receipts were somewhat better, being 54 cars. This caused buyers to hold back and try to bear prices, but holders refused to yield concessions in the face of a light crop. The country is still in the market for horse hay, but dairy people bought sparingly, they using mostly green alfalfa.

We quote f. o. b. Los Angeles:
Barley hay, ton\$21.00@23.00
Oat hay, ton22.00@24.00
Alfalfa, northern, ton20.00@22.00
Alfalfa, local, ton22.00@23.00
Straw, ton11.00@12.00

NEW VEGETABLES.

There was a marked increase in the receipts of new vegetables the past week and with the increased offerings prices broke sharply. At the decline, however, there was a better movement. The cabbage suffered the greatest decline. Receipts liberal and demand very light. Shippers out of the market and cabbage can now be bought at \$40@45 per ton

Special Citrus Market Report

Los Angeles, April 30, 1917.

Shipments of citrus fruits from Southern California from November 1 to April 25: Oranges, 20,695 cars and lemons 3552 cars. Same time last year: Oranges, 17,765 cars and lemons 2843 cars.

The eastern markets as a whole were hardly so strong the past week. Fancy oranges were steady and met with a fairly good demand. The less well-known brands, however, were slow sale and at times sold lower. Lemons held steady and met with a very good demand. Locally the market was draggy and lower. The abundance of strawberries and their cheapness interfering with the local demand for oranges. Local packers bought more sparingly than for a long time and only bid 1 1/4c for oranges and did not buy freely at these figures. Demand lighter from the trade, even for the best. Tangerines out of the market. Grapefruit coming in freely, slow sale and lower 1/2c per pound. Packers now only bidding 1@1 1/4c per pound in the grove

picked. Lemons lower in sympathy with oranges and slow sale. Packers only bidding 1/2c per pound in the grove picked for the best. Poor have to be sold for what they will bring.

AUCTION SALES.

New York, April 30, 1917.

Forty-six cars at navels, one sweets, seven mixed and two cars lemons sold. Market firm on navels and doing better on lemons. Weather cloudy. California navels averaged \$1.55@3.20. Sweets, \$1.30@2.00. Lemons averaged \$2.10@2.75.

Boston, April 30, 1917.

Thirty-six cars sold. Market unchanged on oranges and lemons. Navels averaged \$1.35@2.85. Lemons averaged \$1.40@3.30.

Philadelphia, April 30, 1917.

Twenty-nine cars sold. Market unchanged on oranges and lemons. California navels averaged \$1.00@2.55. Lemons averaged \$1.85@2.65.

EASTERN PEACHES SHORT.

Eastern peaches were hard hit by March frosts as reported by the California Fruit Exchange to its members. Georgia less than half a crop, not over 3,000 cars; Texas half crop, 1,500 cars; Oklahoma, West Virginia, Ohio, Michigan, and Arkansas peaches reduced by winter killing frost or drought. Fair crops expected in Missouri and Colorado and fine prospects in Maryland and Delaware.

PRUNE AND APRICOT GROWERS ORGANIZED.

The work of securing the needed membership and funds to handle and market the prune and apricot crops of California by a co-operative association was brought to a successful finish this week. At a meeting of trustees and directors of the California Prune and Apricot Growers, Inc., held at San Jose last Monday, the announcement was made that over \$750,000 had been subscribed and more than 75 per cent of the acreage and tonnage had been secured. A vote of thanks was tendered State Market Director Weinstock for his aid in perfecting the organization. The coming crop will be handled by the association through the packing houses already established, and the crop sold under the direction of the association. Growers are to be congratulated upon the successful prosecution of the campaign, especially as the entire cost was less than 5 per cent. The new association starts out with as fine a body of officers and directors as could be wished and success is predicted to both it and the growers.

that a week ago sold at \$90@100 per ton. Asparagus, peas, new potatoes and new onions are all sharply off and the market weak at the decline. New string beans are now on the market in fair supply and can be had at much lower prices.

We quote from growers:
Cabbage, per cwt.\$2.25@2.50
Local and Northern, per lb.4@6c
New potatoes, per lb.5@7c
Peas, per lb.3@4c
New onions, silver skins and Bermuda, per crate\$1.75@2.00
String beans, per lb.12c

BEANS.
The seeding time now being at hand and a good demand being had from the country for seed, all beans have been marked up again, as stocks are light. The trade, however, is taking very few beans at present high prices. No more tepary on hand.

We quote from growers:
Limas18c
Large white17c
Small white17c
Pinks13c
Blackeyes12@12½c

BERRIES.
Market sharply lower from a week ago. Receipts of strawberries liberal and the quality of berries coming in good. The high price of sugar influenced light buying for preserving and leaving a more liberal supply for table use, had a bearish influence upon prices. Hence the break. But few blackberries coming in and they are unchanged.

We quote from growers:
Strawberries, poor to choice, per 30-basket crate80@90c
Fancy, per 30-basket crate.....\$1.15@1.20
Blackberries, per 30-basket crate.....\$5.00

Los Angeles, May 1, 1917.
CATTLE—The poor condition of the pastures in many sections and high price of feed are causing freer offerings of cattle on the market. Hence there was a decidedly weaker tone to the market the past week. At the same time choice fat steers met with a fair demand at steady prices. The less desirable at times, however, it was thought, were a shade lower. Killers more independent and inclined to judge more closely as the beef market is dull.

Calves continue to come in freely and are dull and weak.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs.\$9.50@10.00
Prime cows and heifers.7.50@ 8.00
Good cows and heifers.7.00@ 7.50
Calves8.00@ 9.00

HOGS—While there is no change to note in this market from a week ago, there was little real life to it. Too many hogs coming in only half fat, being forced to market on account of the high price of feed, and they were rather slow sale. Choice grain fed hogs on the other hand continue scarce and are finding a ready sale at a premium of \$1.00 to \$1.50 per cwt. over quotations under the influence of high markets east. California and Arizona continue to furnish what hogs coming in. Killers, while all in

the market and wanting supplies, were less anxious for hogs than a while back, as there has been a noticeable falling off in the demand for pork.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250@300 lbs.\$11.50@12.00
Mixed, 200@250 lbs.12.00@13.00
Light, 175@200 lbs.12.00@13.00
Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP.—The market the past week was rather quiet and weak. While prices show no quotable change, killers were less anxious for supplies, while holders in the country with marketable sheep and lambs, influenced by the high price of feed, were more anxious to sell. California and Arizona furnished what coming in and they were in only fair flesh, showing economical feeding. Killers, while all in the market, are wanting fewer sheep than a while back, as the trade is taking mutton and lamb less freely at the high prices.

Per cwt. f. o. b. Los Angeles:
Prime wethers\$ 9.00@10.00
Prime ewes9.50@10.00
Yearlings10.50@11.00
Lambs13.00@14.00

North Portland, Ore., April 30, 1917.

CATTLE—Today's receipts of cattle were about 700 head, the quality of which was the best seen on the market for some time. There was an excellent demand from a big string of buyers and prices advanced sharply with a gain of 25 to 75 cents. One load of fancy yearlings from Dillard, Oregon, topped the market at \$11.25, with four other loads of prime light grain-fed steers which brought \$11.00, with a large string from \$10.50 up. Ordinary grade sold from \$9.50 to \$9.85, with a load of good heavy steers at \$10.15. One load of prime yearling heifers brought \$10.65; several other small bunches sold from \$8.00 to \$10.00. Strictly good cows sold from \$8.50 to \$9.00, with ordinary ones at \$8.00. The off grade dairy bred cows sold from \$6.00 to \$7.50, an advance of about 25 cents over last week. Best heavy bulls brought \$7.75 to \$8.25, with fair kind bringing from \$5.50 to \$7.00; the fair light veal calves again brought \$10.00; heavy calves from \$7.00 to \$9.00.

HOGS.—There was but a moderate supply of hogs here today, although the demand was rather slow and prices were generally steady with a week ago. The top of \$15.85 was a new record, while several other loads brought \$15.75, with the bulk of the good hogs from \$15.50 to \$15.65; Pigs sold mostly at \$14.25.

SHEEP.—A small bunch of good wool lambs brought \$13.50, with ewes at \$11.00 and a mixed load of old ewes and bucks brought \$9.75 to \$10.00. The sheep supply being very small, with a slow demand and prices are all unchanged.

PRICE FIXING BY GOVERNMENT REGULATION.

Owing to abnormal economic conditions prevailing at the present time, it has been suggested to Congress by the Secretary of Agriculture that power be conferred upon the Government to fix maximum and minimum prices of food products should an emergency arise to require the exercise of this power. The object of the minimum price would be to assure farmers that they would not have to dispose of their products at a price level involving an inadequate return, or a loss in any event. The power to fix a maximum price would only be exercised when necessary to curb uneconomic speculation and the illegitimate manipulation of food products on the market. The main object of the suggestion, however, is to stimulate production by guaranteeing the producer a fair return on the largest crops he can grow.

Should this suggestion of the Secretary of Agriculture be received with favor, and some form of measure based on this suggestion be enacted into a law, the carrying out of its provisions would probably devolve upon the inter-ally food commission which seems likely to be one outcome of the international war conference of the allies with the President and his advisers now in progress at the national capital.

HONEY.

The past week brought no change in the honey situation. The first two days of the week under warm sunshine the bees are said to have laid up a good deal of orange honey. But the shower of Wednesday turned the weather cold again and the bees did no good the balance of the week, and are said to have eaten up what honey they stored the first two days. Beekeepers under these conditions are refusing to contract honey and buyers are refusing to bid until the crop takes a more definite shape; hence we are unable to give quotations.

Publisher's Department.

"Your swine issue was certainly a valuable paper and a dandy in general get up and scope. Do it again."—W. H. Waugh, Riverside.

The number of new subscribers to the Rural Press during the past three weeks totals 630. All of these were secured without the use of premiums or cutting our subscription price of \$1 per year.

"Your paper has improved wonderfully, and every issue is worth the price of the year's subscription. Every farmer and fruit grower should have it in his library."—Geo. A. Lammiman, Shasta county.

"I have before me your issue of April 7th, which I note is a 'hog special,' and I certainly want to compliment you upon this number. It is brimful of the most interesting kind of material and I know it will be a boon to the hog industry in the West and particularly California. You certainly have been most fair in the way you have handled all breeds and every department is complete in every detail. We will surely keep this number on file for reference."—N. M. Gordon, Swine World, Chicago.

California citrus growers in particular should view with satisfaction the fact that inquiries for our own State stock are being received from Florida, which State evidently has come to the conclusion that California nurseries are growing superior trees, trees that bring forth good fruit. The Wallace Nurseries, Los Angeles, who have found the Rural Press one of their far-reaching mediums, reports inquiries from Florida and even from Japan. Ventura and other counties have been calling on them for trees and they state this season has been far in excess of last year and that the prospects are exceptionally good for next spring and that much higher prices will prevail.

MISCELLANEOUS.

EVERY SIZE WROUGHT IRON WATER
Pipe and screw casing water pipe, guaranteed as good as new. Prices right. Send for catalogue. We beat no one; everybody gets a Square Deal. Weissbaum Pipe Works, 160 Eleventh St., San Francisco.

FOR SALE.—New Bull Tractor, five-horse pull at drawbar, twelve on belt. Has only plowed ten acres. Burns distillate. Good as new. \$375.00. Will demonstrate. Box 540, Rural Press.

GROCERIES WHOLESALE.—Our prices are the lowest and our quality the highest. Dollars saved on every order. Freight paid within 100 miles. Send for catalog. Freese and Company, Mail Order Grocers, 1264 Devisadero St., San Francisco.

SECOND-HAND WATER PIPE and Screw Casing. New threads and couplings dipped in hot asphaltum. All guaranteed. Send us your inquiry. Scheer Pipe Works, 306-8 Howard St., San Francisco.

AT LAST THE PERFECT SILO—THE Star Round; No hoops. No bolts. No experiments. Any one can erect. Close price. Address: D. O. Lively, 215 Hobart Bldg., San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. Smiths' Cash Store, 106 Clay St., San Francisco.

WANTED TO BUY—CANARIES—1 Coolidge Place, off Jackson, San Francisco.

SEEDS, PLANTS AND TREES.

SEED BEANS.—We sell direct to the grower. Buy now before the advance. Our stock is carefully selected. Satisfaction guaranteed. Tell us the nature of your soil and we will suggest the best variety. Modesto Farmers Union, Modesto.

ALFALFA SEED.—There is a difference in the varieties and strains of alfalfa seed. Send your address for sample and our low price, and we will tell you just how our seed is selected—and why. Bomberger Seed Co., Modesto, Cal.

SEED CORN.—Egyptian white, large pure white kernels. High germination test. None better offered. Also milo maize, feterita, and Egyptian wheat. Modesto Farmers' Union, Modesto.

SUDAN GRASS SEED.—Local grown and inspected, 35c per lb. while it lasts. Black amber sorghum, choice quality, 5½c per lb. Modesto Farmers Union, Modesto, Cal.

WANTED AT ONCE.—30 sacks Tepary beans. Send sample and state lowest price. K. Knutsen, Turlock, Cal.

WANTED.

WANTED.—Young men and women to attend the Western Normal Course—Normal and Academic. The Normal Course gives an adequate preparation for teaching, at a great saving in time and money. Academic course gives practical finish to education. Write for Bulletin "A," Western Normal, 524 E. Market St., Stockton, Cal.

WANTED—POSITION.—By young married man. Ten years experience in all branches of farming as worker and foreman. Practical experience and good agricultural education. Milking machine operator. Hard worker, sober, reliable. E. B., 1661 Octavia St., San Francisco.

POSITION DESIRED.—20 years practical experience constructing operating and repairing electrical and mechanical apparatus, pumps, gasoline engines, storage batteries, etc. Some automobile experience. Age 38; strictly sober. First-class references. Box 530, Rural Press.

WANTED.—Sober and industrious man for orchard work, must be able to handle team and accustomed to irrigating. Good opportunity for right man. State references and experience. Address, Box 520, Rural Press.

WANTED, MARRIED COUPLE.—Man experienced in general farm work and wife to cook for owner whenever needed. References required. Address, P. O. Box 34, Menlo Park, California.

YOUNG MAN.—Industrious, reliable, wants work on poultry ranch. J. M., 1661 Octavia St., San Francisco.

COUNTRY LANDS.

A BARGAIN ORCHARD.—In full bearing, 20 acres; about one mile from the city of Modesto, just off State Highway. Present crop Muir and Cling peaches, estimated at \$3000. Beautiful country place, almost in the city. Bungalow with bath, fine tank house and wind mill, drying trays, etc. Only \$10,000. Easy terms, as I must go East. Full particulars. E. A. Rodgers, Box 350, Route D, Modesto, Cal.

RANCH TO LEASE OR FOR SALE.—9500 acres in Tehama County—8000 acres rolling hill land, 1500 low level land. Suitable for stock and general farming. Some fruit. All well fenced. Summer range in Trinity County also. Address, P. O. Box 124, Cottonwood, Cal.

B. S. COELHO, CORCORAN, CAL. Owner—150 acres improved, subdivided alfalfa dairy, Stratford. Keeps 85 cows. C. E. Robertson, 105 Montgomery St., San Francisco.

STEVENS COUNTY.—Logged-off land where stock-raising and dairying pay. Free booklet. Phoenix Lumber Co., Crop Department, Spokane, Washington.

WANTED to hear from owner of good ranch for sale. State cash price and description. D. F. Bush, Minneapolis, Minn.

STATE, GOVERNMENT AND INDIAN Lands.—Bargains overlooked. Free New Blue Booklet. Joseph Clark, Sacramento.

BRENTWOOD IRRIGATED FARMS

63 miles from San Francisco in Contra Costa county. 1,000 Acres planted in Alfalfa. For sale in tracts of 10 acres and up. Also first class orchard and general farming land. All under irrigation. One to three miles from railroad station.

Easy Terms of Payment. For prices, etc., address Balfour, Guthrie & Co., Land Department, 350 California St., San Francisco

Trust John W. Bate To Build a Car As You Want It

The latest Mitchells will show you that John W. Bate is a master at building cars.

You have never, at any price, seen a car so complete. You have never seen such luxury, so much over-strength, at anywhere near our price.

How Mr. Bate Works

Mr. Bate, the great efficiency expert, has spent 14 years on Mitchells. The latest Mitchell is his 19th model. It is the final result of 700 improvements.

But he started by building this model plant, which now covers 45 acres. He spent millions of dollars to build and equip it to build this one type economically.

Nowhere else in the world could a car like the Mitchell be built at the Mitchell cost. His methods will save us on this year's output about \$4,000,000.

It is that saving which pays for all the Mitchell extras, and gives men these matchless cars.

31 Extra Features

There are 31 features in the Mitchell which nearly all cars omit. Things like a power tire pump, reversible headlights, dashboard engine primer, ball-bearing steering gear.

There is more beauty and luxury than

was ever before combined in a modest-priced car. The reason is, we build our own bodies. And all we save goes into this extra luxury.

And no other car has Bate cantilever springs. They make the Mitchell ride like an aeroplane. In two years' use, on many thousand cars, not one of these springs has broken.

100% Over-Strength

But the chief Mitchell extra is double strength in every vital part. In the past three years we have doubled our margins of safety. We are making the Mitchell a lifetime car. Three of these cars have already run over 200,000 miles each. That's 40 years of ordinary service.

Over 440 parts are built of toughened steel. All safety parts are vastly over-

TWO SIZES

Mitchell—a roomy, 7-passenger Six, with 127-inch wheelbase and a highly-developed 48-horsepower motor.

Price \$1460, f. o. b. Racine

Mitchell Junior—a 5-passenger Six on similar lines, with 120-inch wheelbase and a 40-horsepower motor— $\frac{1}{4}$ -inch smaller bore.

Price \$1150, f. o. b. Racine
Price will be advanced to \$1195 MAY 10th
Also six styles of enclosed and convertible bodies. Also new Club Roadster.

size. All parts which get a major strain are built of Chrome-Vanadium.

In these days of high steel prices, any car which is built this way is either rare or costly.

Everything You Want

Mr. Bate has worked 14 years to combine in Mitchells everything you want. He spent one year in Europe, to glean the best ideas from there.

Before designing this year's Mitchells, his artists and experts examined 257 new models. So all the known attractions are combined in these Mitchell cars.

One Size, \$1150

Price will be advanced to \$1195 MAY 10th
The smaller Mitchell—Mitchell Junior—costs only \$1150. Yet it is a powerful Six, with a 120-inch wheelbase. You never saw such value in a car around this price.

But the larger Mitchell offers special value. See both sizes. See the extra features, the extra beauty and the extra strength. You will want a Bate-built Mitchell then for the car you buy to keep.

If you don't know the nearest Mitchell dealer, ask us for his name.

Good Types of California Dairy Buildings

[Written for Pacific Rural Press.]

IN THE construction of dairy buildings the California dairyman must have several things in mind, principally sanitation, convenience, and reasonable cost of erection. The California dairy barn need not be so elaborate or expensive as those built in colder climates; and for that reason we need standards of dairy architecture distinctively Californian.

It was to incorporate sanitation and convenience in buildings as cheap or cheaper than the old style combination hay and milking barn that the State Dairy Bureau, in co-operation with the University of California, the United States Department of Agriculture and various boards of health evolved the plans on this and other pages of this issue. These plans, as well as those of other more elaborate structures, are given in the biennial report of the State Dairy Bureau, recently issued, purely as suggestions to the intending builder and not required to comply with present laws.

MILKING BARN.

The top illustration on this page shows the interior of a milking barn for hot summers and windy winters. For very windy, dusty, or cold districts, or in sections where heavy rainfall is prevalent, the open space along the leeward side could be profitably windowed, instead of screened, as the plan calls for.

If windowed, it would be advisable to have them hinged from the bottom so that the fresh air circulates above rather than across the space occupied by the cows. There are several patented devices on the market for the opening and closing of windows by lever which are not expensive and which save much labor.

The outside wall on the leeward side is boarded up about four feet, or might be solid concrete that high and four inches thick. Below the plate the studding is covered with a 12-inch board. The remaining five feet is left open, but screened to keep out flies and chickens. The side toward prevailing winter winds is boarded up to afford shelter, with a window about 3x3 feet for every six feet of building. This gives about four square feet of light to each cow on the windward side. In some sections the screened opening might be left on both sides of the building.

Concrete Floor: The floor plan illustration shows but one of the two strings provided for in the above barn. The floor is of four-inch concrete, and provides for stalls three feet

wide. The concrete is made of a mixture of one part cement, two parts sand, and three parts broken stone. A slope of $\frac{1}{4}$ inch to each foot of floor will afford sufficient drainage. It would be well to have both the gutter and floor slope at the same pitch and in the same direction, rather than to lay the floor level and the gutter on an incline, as the latter method results in a deep, dangerous gutter at one end of the building. The floor may slope from the center toward each end, from each end toward the center, or from one end to the other. Either of the last mentioned ways simplifies drainage cost. The plan also provides for a slope from

both side walls to the gutter. The length of the stalls should depend upon the size of the cows to be milked; but 4 feet 8 inches will serve for smaller cows. A concrete manger two feet wide across the top would perhaps be better if oval shaped, as it would be more easily cleaned.

The width of the gutter should not be less than 14 inches nor more than 18 inches. The plan calls for a depth of three inches on the front side and one-half inch slope to the back side. This is an important detail, as it allows the liquids access to the sewer when the solids would otherwise obstruct the gutter. Where the barn is to house two strings like the one illustrated, the stanchions may either face the walls or each other, according to the preference of the builder.

In the erection of permanent dairy barns steel stanchions, manure and feed carriers should not be forgotten: for while they are still considered conveniences rather than necessities by some, all who have installed them praise their sanitary and labor saving features.

The plans herein shown provide space for these equipments; and the small additional expense incurred will be repaid many times in labor saved.

MILK ROOM.

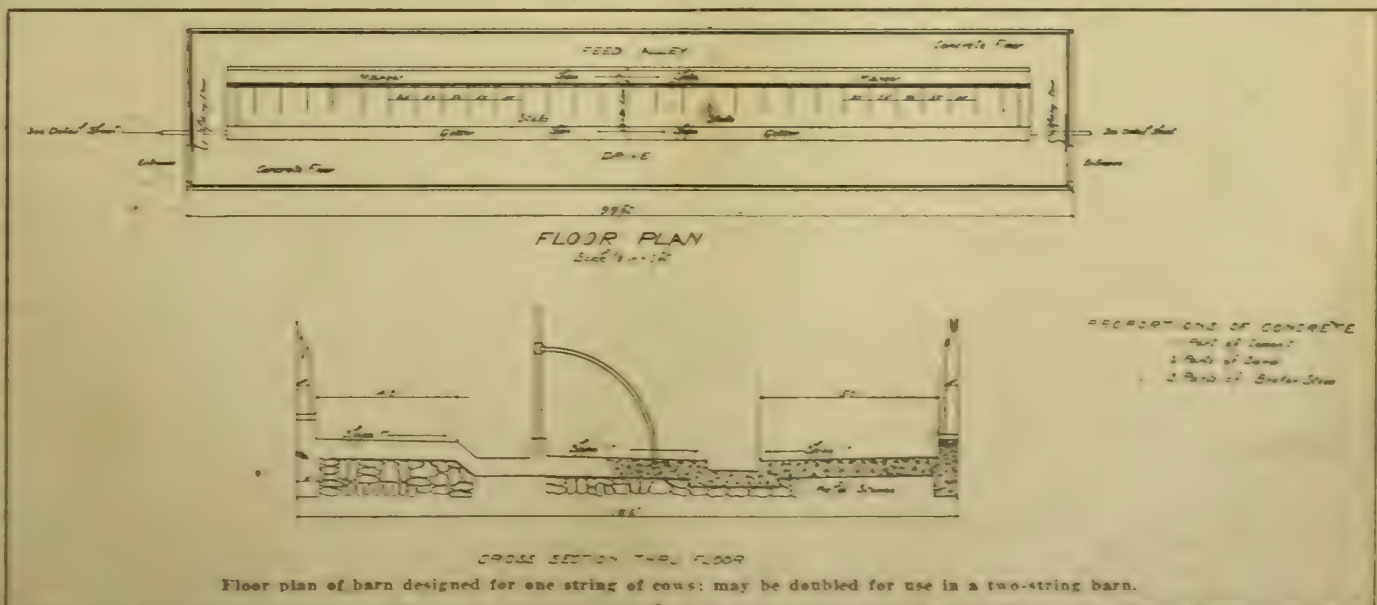

A milk room floor plan is shown on another page. This building has entrances on the north side, as not nearly so many flies will rest on the door and be admitted to the room as if it were on the south side. It is planned that the windows all be screened, and the window frames hinged on the bottom so they can be opened to afford ventilation by lowering the top of the sash into the room. This floor plan is prepared by the United States Department of Agriculture for coal burning boilers. In California our distillate fuel will be kept in a tank on a tower outside the building. A concrete floor slopes from all directions to an open drain provided in the milk room; and a sliding door might well separate the wash room from the separator room. Provision is made for pouring

the milk from the outside through a metal container directly into a vat over the milk cooler or separator. If whole milk is to be sold, it may run directly over the aerator; but if the product is to be sold as butter fat, it should run into a metal vat located over the separator. In the latter case the aerator can be attached to the separator, only the cream being cooled.

The cement cooling tank can be profitably included, as it provides a cool place for storage of either cream or milk. Nothing is more imperative in the production of sanitary milk or cream than plenty of boil-

WHEN WILL THE COWS COME HOME?

WE ARE not thinking chiefly of the end of the war, although the question does suggest that. The human mind is sorely distressed over the increasing tumult in world's affairs and dreams longingly of peace and quietude. Naturally such dreams most often carry the dreamer very far from current events and from present time and paint for his delight pictures of his childhood in peaceful rural scenes and of the quietest moment in such scenes—as the afterglow of summer sunset bathes the daisies and buttercups of country lanes in transcendent light and all sounds are for the moment hushed: "When the Cows Come Home"!

But though such a contrast between the normal and the present condition of human affairs is timely and impressive, we are, at the moment, thinking of the cow not as a movie star on a film of peace, but as a real actor and factor in the legitimate industrial drama which was established upon her functions and products, by the Scythians or by some other energetic and progressive peoples, before the dawn of history. And the thought is that, old as the dairy is as a human art and industry, and marvelous as its extensions and improvements upon primeval types have been, dairying is still the most plastic and expansible of our agricultural specialties and has potentiality for future development and human service which is not reduced, but apparently increased, by the fact that during the last half century the industry of the cow has lifted nations into prosperity; has given mankind some of the most impressive demonstrations of the power of co-operation for individual advancement; has shown most clearly the influence of science and invention in multiplying producing power; has erected new standards of commercial suitability and filled new arteries of international trade—and, having done all this within the easy memory of men now living, stands now in plain sight promising still greater achievements in the immediate future. When we ask then: "When will the cows come home?"—meaning the return of the industry to its old ideals of rural quiet and passivity—we have to answer that they never will come home: they will be ever moving toward richer pastures and greater service to mankind!

COWS IN CALIFORNIA.

WE ARE giving this issue largely to the dairy industry as pursued in this State—not trying to compass it at all, but merely to point out phases and features of up-to-date practices which may be suggestive to our readers of ways with cows which may help to secure ampler return from them for the labor and investment which are made to help them in their service to individuals who know and treat them well. We hope the effort we make to set forth helps to dairy producers in this issue will be instrumental in bringing out, in future issues, much more which will be influential toward the same end. And all readers of any dairy connection are cordially

invited to take part with us in the public-spirited effort to build the industrial service of the cow more broadly and firmly into the foundations of California's agricultural future.

To one who came to California forty-two years ago from central New York, the region which was at that time greatest in the dairy specialty of the country, one of the most gratifying reflections is the progress made in California dairying since 1875. Of cows kept on farms, and thus engaged in dairy products chiefly, apart from market milk, California had, in 1875, 340,000, worth \$10,944,105, while in 1915 her record was 568,000 cows, worth \$39,192,000. This increased value per cow involves improved quality in the cow and improved standing of milk production as a business—both of which are significant progressive points. Of the value of the State dairy output, the first report of the California Dairy Bureau, in 1906, estimated it at \$12,331,067, and the last report, in 1916, placed the value of products at \$40,310,105—which also involves two main factors, the increased production per cow and the improved selling prices of products. Since 1875, then, we have increased our cow-power about 67 per cent and increased the value of our output of dairy products 226 per cent. Rolled up somewhere in that bundle of thought-food are the reasons why dairying is now the most buoyant of our California agricultural specialties!

WHY THEY ARE COMING HOME.

"COMING HOME," in American agriculture, does not mean returning to the log cabins, sod houses, rough-lumber shacks and adobes of our fathers and grandfathers. It means going forward to the vine-clad cottages, bungalows, villas and rural mansions of our generation's achievements and in this direction our cows are leading us—not with jangling neck-bells but with the clear ringing of golden coins. And what are the local phases of preparedness for this forward movement? They include:

For the cow: Better breeding, feeding, care and shelter.

For the man: Better dairy science and practice.

For the industry: Better equipment, higher standards, wider markets and reasonable financing.

It aches us to preach from each of these texts, but it is fortunately not necessary. Each reader can look his neighbor in the face and bank-book; his neighbor's cow in the bag; his neighbor's farm in the pastures, corrals and buildings and preach his own sermon, from the "firstly, secondly and thirdly" which we have given him. To outline a general contrast between then and now we can perhaps help our younger brothers with illustrations. In 1875 there was but one cow-milking barn in the State and that not a very large one; there was but one silo, and that was a rough-board enclosure of a tank-frame which poisoned some horses with rotten silage: there was not a cream-separator, all cream was slapped from a pan with a stick, usually dirty: there was not a modern creamery in the State, though some ranch dairy-houses were creditable in their way: there was not a refrigerating outfit, though the mountain valleys had some natural-ice houses: there was not a power-churn in the modern sense, though a few bulls were hauling around sweeps: the only "dairy engine" was such a bull: there was no cream-ripening outfit, though there were cream-jars strong enough to drive a man out of a milk room; there was no dairy association, no dairy instruction, no dairy exchange: there were good dairy breeds but no definite dairy-breeding nor agreement upon points to be attained, nor exact measures of what constituted excellence: there were only a few alfalfa pastures along the Sacramento river and their product was condemned: the sorghums were a curiosity: the interior valleys were practically conceded to be unfit for dairying and the dairy hope of the State was grounded in the coast and mountain fringes. Capital for dairying was only to be had at rates which would make a pawnbroker's conscience turn over in its grave. Such, in the rough, was the dairy interest of California at that date, and yet there were groups of good dairymen who struggled against all these handicaps and produced

clean, delicious butter and made good money. It was in the achievements of these deep-seeing and energetic people that is to be found the foundation of the recognition of the dairy suitability and resources of California and they and their children have been among the leaders toward the revolution of ideals, equipments and practices which has made our present product worth forty millions a year—and more fast coming.

THE BARS ARE DOWN.

BY THE distressing contrast which we have suggested we do not design condemnation of the past, for it was up to its lights and powers, but exaltation of the present. And it does not devolve upon us to delineate the features of the present: they are set forth by our special writers in every issue of this journal, so that each reader can draw from them suggestions for his own work and progressive planning. The thing to be glad about now is that the bars are down and the way open to the attainment of California's great dairy endowment in favoring climate, rich pasture growths, abundant grains and large production of mill-feeds, full offerings of the most modern dairy equipments, large resources of the best dairy breeds of cattle, good supply of trained dairy operators, and that which makes all these concretely desirable, our unequalled dairy marketing opportunities. All these things make our dairying inviting and dependable. It has not been easy to get all these things: it has cost much money and many life-long efforts by Californians to throw down all the bars in the development of so great a dairy State in so short a time—but the way is now clear and that is one reason why we multiply our pages this week to give a field to those who offer the agencies by which California's great dairy future is to be attained. The State of California appreciates its dairy industry, safeguards and promotes its future by the operation of its Dairy Bureau, which contends for excellence to the purchaser and fairness to the producer and has been working for more than twenty years continuously toward these ends. The result of such prolonged praiseworthy effort by the State; by the breeders of world-beating dairy cattle; by producers, individually and co-operatively, under the leadership of the State Director of Markets; by the organization of the dairy trade to operate under the regulations for export and interstate commerce and by the thoroughly organized educational enterprise under the leadership of the University of California—is that California now has her dairy industry in a form to justify increased interest and investment by our own people and by those who know the dairy in other States and are now coming to begin their lives anew under the inviting conditions which California offers.

In the changes which have come in the development of the whole country, California will have in the future a clearer commercial field than in the past. Surpluses of dairy products which in the past have sought our markets will now find ampler outlets nearer their supply bases: with three million people, in the place of one million formerly, California has now a much more capacious home market and at the same time is finding a much wider export outlet. A great demand has developed in the Eastern States and in Europe, while the countries around the Pacific are disclosing each year a greater capacity for the consumption of dairy goods. All these things which were fondly dreamed of during the last two score years are now being realized. The bars are down!

KEEP OFF THE GRASS!

AFTER throwing down the bars, it may seem graceless to erect such a sign—but it is a kind of human nature. We remember that we cared little for the cows after we had pelted the last of the bunch through the bars to go up the lane, for we were legging it across the field to join the rest of the kids in the old swimming hole. And so now having let down the bars to greater dairy enterprise for California, we take a little dip on our own account. We were quite inclined at first to sympathize with the impatience of our esteemed friend of the Chronicle when he said: There has been quite enough exhortation of the

farmers to attend to their business. It is time to let the farmers alone and attend to our own business. There are two good reasons for that. In the first place, the farmers will pay no more attention to us than we should pay to them—which is none at all, except when we are running for office, and another reason why we should quiet down is that the more we yawp and hoard the higher the prices will go. There will be food enough and at reasonable prices if we will stop howling and go to work building ships, raising crops, developing water power, buying and selling merchandise, digging ditches or whatever belongs to the station in life "to which God has been pleased to call us," or to which we have attained by accident or otherwise. It is not even necessary to talk "economy." Prices will attend to that, and unless prices do the work it will not be done in any family.

This is the good old doctrine of sticking to your own job and probably it was never better stated, to keep people from busybodying, than it was by St. Paul when he said:

Having, then, gifts differing according to the grace that is given to us, whether prophecy, let us prophesy according to the proportion of faith; or ministry, let us wait on our ministering; or he that teacheth, on teaching; or he that exhorteth,

on exhortation. Be not wise in your own conceits.

We have been sorely tempted to break out, as our friend of the Chronicle has done, and give all these people who are so busy jawing the farmers, St. Paul for not minding their own business. We have, however, checked ourselves because there is really in the current publicity given to farming such a chance for demonstrating the farmer's true relation to the peace, prosperity and continued existence of the world! These patriotic and philanthropic busybodies have been giving it to the farmer in the neck for the last few weeks, but, as things look to us, every tap the farmer now gets in the neck will later land a dollar in his pocket and pull a tuxedo over his back. Really, the farmer does not much care what he gets in the neck, for he has been hammered on his cervical vertebrae for five or ten thousand years. Therefore we advise our dear contemporary of the Chronicle not to be peeved about what the farmer is now getting. A stiff neck will not bother him much if he can get his head and shoulders through the old crust of social and commercial discrimination and domination!

the men who actually did the farming could borrow money from the credit banks, because they could not understand what such people needed money for; it was the landlord who was apt to need money, because he had to furnish everything; if the tenant needed cash, he could get an advance from the landlord. Very much was said about the wonderful growth of co-operative credit banks and co-operative supply houses, but it all seemed to be co-operation among the higher-ups and not among small land-owners farming their own lands as the small farmers of the United States usually do. It, therefore, did not seem to be a scheme to enable people to own their own homes, but rather a scheme to help large owners to finance a community of tenant families and to increase their products. The only equivalent for ownership on the part of the actual farmer is the fact that these farming families hold the land for decades and for generations, the present tenant farming the land on shares, just as his father, grandfather, etc., had done before him. It is therefore a system of tenantry with a recognized tenure and this, of course, as compared with systems of brief tenantry, in which the tenant has no tenure and no motive for land and home improvement, may have, from the European point of view of landlord ownership, a certain degree of beneficence. It appears to us as, perhaps, a very good way to do a thing which should not be done at all, because it crushes aspiration for self-ownership.

Spraying for Vine Hoppers.

To the Editor: What can be done to rid my vineyard of vine hoppers? We have been troubled with them the last two years, but they have not infested the vines so early before as this year. Am afraid they will ruin this year's crop.—C. J. T., Tudor.

When the hoppers have made the progress you note, nothing remains to be done but to spray the vines. The experiments made by Prof. Quayle, and published in University Experiment Station Circular 126, show that one pint of tobacco extract (40 per cent) and two pounds of hard soap (or two quarts of liquid soap) to 200 gallons of water is a good killer for vine hoppers before they get their wings. This spray must be shot with good force against the under sides of the leaves and a force pump and proper nozzle to do this are indispensable. It will not hurt the hoppers to shower the vines on the upper leaf surfaces. The proper spraying will not get all the hoppers, but it will reduce them to negligible numbers and avert serious injury.

Sulphuring Vines.

To the Editor: Is it the proper time for sulphuring grape vines? My Tokays have new shoots about 5 inches long and thick foliage. Is it any harm to sulphur when blooming? Does too much sulphur burn the berries? Is it better to apply sulphur by machine or by barley sack?—Subscriber, Mayhews.

The chief point is to get the sulphuring a little ahead of the growth affected by it. Where mildew is bad and always to be expected, sulphuring should be very early: some even believe in sulphuring the stump before the buds break. It should certainly be done on such growth as you describe—if experience shows that mildew is to be expected. Sulphuring when in bloom may be better avoided by working before and after. Too much sulphur is not dangerous, but is wasteful. It does not matter how you get the sulphur on, but if you have much to do, the machine is much better.

Cleaning Seeds.

To the Editor: Please tell the proper way to clean seeds that are covered with pulp, like tomatoes, gherkins, etc.—J. V. H., Los Gatos.

Let the fruits become soft ripe, and then squeeze out pulp and seeds into water, and wash them out by rubbing with the hands. If this does not work easily let the pulp ferment in the water and then the clean seeds will usually separate themselves and go to the bottom of the vessel. Such fermentation will not hurt the seeds. If you do not care to have the mess standing around for fermentation, a teaspoonful of caustic soda to the pail of water will make the washing easier and not injure the seeds. When clean, dry thoroughly in the sun before putting away, to prevent molding.

Bean Aphis Abundant.

To the Editor: I send you some branches of horse beans that are affected with some kind of lice. Kindly advise as soon as possible what to do for it. Upon investigation, I find nearly all the horse beans in this locality are affected the same way and nobody seems to know what to do. If something is not done I am of the opinion the beans of that variety will be a failure.—N. D. H., Freepoint.

It has been a very bad year for aphis or plant lice of all kinds. The continued cool weather and absence of hot dry winds have favored their multiplication, and the temperature-deficiency, which has prevailed for months, has probably delayed the development of their natural enemies. Plant lice, for instance, are bringing forth young freely during rainy-season temperatures, when lady birds are inactive. Plant lice can be killed by spraying with tobacco and soap washes and with emulsions, etc., but the practicability of the attempt is limited by the cost as compared with the value of the crop. For this reason such treatments are not undertaken with ordinary field crops. Beans would now justify expenditure which would usually not be warranted. That is a proposition which you must figure out for yourself. The chance is that the crop will not be hurt as much as now seems to be indicated.

The "Metairie" System of Tenantry.

To the Editor: Can you give information in your valuable journal about the system of tenancy of land called "Metairie"? There should be some good points in it or it would not have been so long in use in France and Italy.—J. P. D., Placerville.

The French terms "metairie" and "metayage" simply mean "farming on shares" or giving the landlord a part of the produce. There are many ways or systems of doing this. As practiced in Europe, there are good points about it if your purpose is to maintain for generations a class of dependent, docile and contented peasant tenantry, which never hopes to own the land nor to question the landlord's over-lordship. We saw it in operation in Tuscany, where, in the Florence region at least, it is so firmly rooted that no one seemed to expect anything else ever to exist. In Tuscany the greatest agricultural thing is the landlord, and he handles his land by subdivisions of different sizes, each farmed by a family of tenants—the size of the holding determined by the working force of the family. The landlord furnishes everything but labor, and the income from the crops is divided equally between the landlord and the working family, settlements being made usually once a year. The tenants do not expect to become proprietors; in fact, the experts who expounded the situation to us seemed surprised that such possibility should be mentioned. They were also surprised when asked if

Black Aphis on Almond.

To the Editor: I am sending an almond twig covered with some insect. I will appreciate any information you can give me regarding it. It is the first I have seen in my orchard, which has been free from all kinds of pests.—M. F., Parkfield.

It is the black aphis of the peach. When the almond is budded on the peach root this pest is sometimes carried in on this root, which it infests and in that case it may appear on the almond and plum, though it does not care much for those trees. Spray with tobacco wash and soak the ground around the main roots with the same wash, the same strength used in spraying the top.

Hollyhock Rust

To the Editor: My hollyhocks are turning yellow. On the lower leaves there is something that looks like rust. I have sprayed with whale oil soap, but it does not do any good. What can be done for it? Last year was the same, but it came later in the year.—M. H. S., Mountain View.

The disease is called hollyhock rust. It is the work of a fungus and is therefore not affected by whale oil soap, which is an insecticide. Help might be expected from spraying with the Bordeaux mixture with a nozzle to reach the under surfaces of the leaves, but not very satisfactory results are reported. Hollyhock experts say that more can be done by cutting off all leaves which show the pustules for about six weeks after growth starts and allowing only perfectly healthy leaves to grow. This reduces sources of infection and secures good foliage and flowers during the rest of the season.

Cow Peas for Hogs.

To the Editor: How do cow peas best benefit hogs, both for fattening and growing?—E. S. H., Burrel.

Cow peas as green forage and hay are comparable with alfalfa and produce similar service in growing pigs. Dry cow peas have a record much like that of corn for fattening hogs when fed separately, but a mixture of equal parts of both constitutes a better balanced ration and has secured a little better results in practice than either one by itself.

California Weather Record

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., May 8, 1917:

Stations—	Rainfall Data.		Temperature	
	Past Week.	Seasonal To Date.	Normal To Date.	Max'm. Min'm.
Eureka20	30.42	43.23	64 42
Red Bluff	17.08	23.73	84 46
Sacramento	12.81	19.40	82 44
San Francisco	15.72	21.58	68 46
San Jose	12.40	16.24	72 38
Fresno	7.06	9.19	84 44
San Luis Obispo	22.54	19.87	78 42
Los Angeles	15.02	15.32	82 50
San Diego	9.78	9.73	80 50

The single bunch weighed seven pounds twelve ounces. The crop was 17,167 pounds of Thompson raisins from 736 vines. Courtesy Fowler Ensign.

Heavy Fowler Crop of Thompson.

[Written for Pacific Rural Press by H. H. Harding, Fresno County.]

Seven hundred and thirty-six Thompson vines eight years old, planted 10x10 feet or 435 per acre, produced 7,381 pounds of raisins for me in 1915 and 17,167 pounds of raisins in 1916. I also lost about a half ton during last fall's rains, owing to the bunches being so large that a great many rotted on the under side before I could get them turned over. Many of the bunches weighed five to eight pounds each and had very large berries. The bunches were so compacted that after the rain in August, it was necessary to pull off all of the leaves on the north side of the vines to let the wind in to dry the grapes or they would have molded. I sulphured every two weeks in May and June, after the new growth was about six inches long. I plowed twice, harrowed twice, suckered and hoed twice. This was all the cultivation they got, as they grew so fast I was unable to get into them with a team.

I did not thin out or pinch off the new shoots. The vines were not irrigated; and it is eight feet to

surface water. So heavy was the crop that it broke wires and even broke a great many stakes off two feet high. Canes too numerous to mention grew 35 feet long. I believe this pinching causes weak laterals to start out making the foliage too thick. A tree too thick will die out inside and what fruit may be inside does not ripen or color up as on the outside where it can get light and air. Why wouldn't it work the same on the vine? This has been my experience since 1884.

Some people thin out the laterals that have no bunches on them. I do not, as I believe they are there for a purpose (what, I can't say) but I believe they are there as a feeder of something in the air.

If you have soil adapted to Thompsons, you can, with proper care and cultivation, produce the crop without the pinching and thinning. If growers would take more pains in selecting fruit wood, and in proper pruning, instead of cutting and slashing any old way to get the brush off, they would have better results. Do not pinch and thin out

or summer-prune after the vine starts—let Nature take its course.

FEW CANES AT WINTER PRUNING.

I commence pruning about the middle of February, being very careful to select close-jointed canes if possible.

The vines are staked with six-foot stakes driven a foot into the ground. One wire is fastened on top of the stakes; the other is two feet lower.

The canes for the lower wire are brought, if possible, from the vine stump six inches above ground. For the upper wire, they come from the stump about three feet above ground.

In 1915, I left two canes on each wire from each side, a total of eight canes from each vine. The canes ran ten feet to the next vine, to bear fruit from vine to vine, filling up the space next to the stumps with fruit. I had lots of small bunches, also small berries, making 7381 pounds of raisins.

In 1916, I pruned the same way, only leaving four canes instead of eight, reaching from vine to vine. I found by so doing that every bud will start. If too many canes are left only about half of the buds start. It takes so much substance to support the extra canes that the grapes are smaller.

Why Do Grapes Not Set Fruit?

[Written for Pacific Rural Press.]

Non-setting of grapes was found to be due in many cases in San Joaquin county to a fungus, botrytis cinerea. Spraying with Bordeaux or atomic sulphur has seemed to produce results; but an inquiry addressed to County Horticultural Commissioner H. H. Ladd is answered thus:

"I find upon inquiry that botrytis cinerea was controlled by cutting back the affected parts to the stump; as it is seldom that you will find more than one or two limbs af-

fectured."

Non-setting is very often due to other causes than this fungus, one of the greatest of which in the southern San Joaquin Valley we believe to be too great water supply and stimulation of wood growth during blooming. Of course, spraying would not help this, but drainage would; and refraining from early spring irrigation would help still more easily. Try it on part of your vineyard if you don't believe it, and let us know your results.

Warts on Walnut Leaves

To the Editor: What is the cause of the roughened warty swellings on my walnut leaves, with white felty growth on the under sides of leaves at these spots?—L. B. J., Elk Grove.

It is the walnut blister mite,

often called erinose mite, which should have been sprayed with lime-sulphur just as the buds were opening. It is too late now; for the mites are well covered. The damage is not likely to be serious.

THE American Beauty Dust Sprayer

SAFETY FIRST

SAVE YOUR FRUIT
Red spider and mite, mildew, rust, and insects are at work on vines and trees. Dust now, before they get a start. Dust sprays are better than liquids, are cheaper and more easily and quickly applied. Serve your country by protecting your crops.

GARDEN PESTS
Bean and pea mildew, rust, red spider, bugs and worms on truck and field crops—kill them all with dry insecticides.

"A puff in time saves the vine." The American Beauty is the fastest and easiest working knapsack duster. Throws a perfect cloud—no lumps, no clogging. Uses least dust—does most work. Ask your dealer for it. Or send us \$11.00 for vineyard and garden size, \$13.50 for orchard size. We ship all charges paid. Refund if not pleased after week's trial.

WE FULLY GUARANTEE EVERY MACHINE.

SULPHUR

Fleur de Soufre, Anchor Brand, Velvet Flowers of Sulphur and Eagle Brand.

Packed in barrels and double sacks. Are the softest Sulphurs that money can buy; the best for vineyards; the best for bleaching purposes. LEAVING NO ASH. SEND FOR ILLUSTRATED BOOKLET; also PRICE LIST and SAMPLES.

SAN FRANCISCO

SULPHUR CO.

San Francisco, Cal.

Kills Prairie Dogs and Gophers of all kinds. Endorsed by State Experimental Station. 1400 tablets prepared for \$1.25. Warranted. Rancher's Tablets 25c. Ask druggist or send direct. Booklet Free. F. D. Chemical Co., Ft. Dodge, Ia.

Pedigreed Trees = Better Fruit and Better Prices. Plant Now.

If it did not cost so much to produce our trees, we could sell them at competitive prices with other nurseries,—why, our methods of selecting our budwood alone would sell our stock. We have had over 20 years' experience in Citrus Trees, and were among the first to advocate bud selection from fruit-bearing wood. The price of the tree is the smallest item in the cost of bringing into bearing. Fertilizer, labor, investment tied up in land—these are the big factors that go to put it, years after the trees are planted, the grove bears miscellaneous offspring.

Here and There in the Fruit Business

Thins Apricot Growth.

Where the new growth from winter pruning cuts on apricots is likely to shade the inside of the tree, it is all right to thin out the new growth in summer and give the rest a chance to develop fruit buds, according to Dave Porter of Kings County, who does more or less of summer thinning all the time. Young trees ought to be suckered as these useless shoots appear, because they would rob the parts that ought to have sap. Twice at least in the season, young trees ought to be systematically thinned out. Care is desirable not to open the trees too much to sunburn.

One season Mr. Porter cut off apricot tips right after the fruit was off in mid-July. Lateral shoots came out a foot long below the cuts, but did not make fruit buds, so he considered himself no farther ahead than if he had not induced these laterals, and the work was done for nothing. Fruit buds, according to Mr. Porter, begin to develop after the fruit is off. They form some on early growth of the present season, but mostly on the growth of the previous season.

Smyrna Figs Drop Unmatured.

To the Editor: We have some White Smyrna fig trees whose fruit grows to good size and then drops off without ripening.—F. M. B., Selby.

Smyrnas do not mature without being pollenized by special wasps which live from year to year in caprifigs. Plant caprifig trees nearby. Meanwhile, send to some of the Fresno nurserymen or to the Government plant garden at Loomis for caprifigs with wasps in them. Place several of these in a basket or can hung in each Smyrna tree. Do this when caprifigs are ripe in June and when the main Smyrna crop is about the size of marbles.

Nicotine for Codling Moth and Aphis.

That the codling moth can be controlled as effectually with nicotine sulphate as with arsenate of lead has again been demonstrated by F. E. DeSelle, horticultural agent, Yakima County, Wash. His experiments are told about in detail in his recent annual report.

"In comparing the results obtained from nicotine with those obtained from arsenate of lead it was found that on plots carefully sprayed at identically the same time and in the same manner with paste arsenate of lead at two pounds to 50 gallons of water, there was an average of 97.33 per cent clean fruit as against over 99 per cent for nicotine. Since all plots were located in the same orchard, only a short distance apart, and that the trees were of the same age and variety, it seems at least reasonable to believe that nicotine sulphate used at the rate of one to 800 is as efficient as arsenate of lead at the rate of two pounds to 50 gallons of water in the control of codling moth. In addition the nicotine possesses additional killing properties against sucking insects."

Mr. DeSelle found that it cost 68 cents per tree to spray with nicotine as against 41 cents to spray

with arsenate of lead, and concludes that "at the present prices for nicotine it would not be advisable to substitute nicotine sulphate for arsenate of lead in codling moth control alone, but where aphis and sucking insects are to be controlled the use of nicotine will result in a considerable saving." — The Fruit Grower.

Mice on Citrus Trees.

[Written for Pacific Rural Press.]

Last summer, Ventura citrus growers found the bases of many trees gnawed by field mice which nested in the mulches about them. It is well to keep mulches away from the trees; and to examine them occasionally, not only for mice, but for gum disease, etc. It was found that poisoned barley generally used for ground squirrels was effective on the mice.

Brown and Black Aphids on Peaches.

To the Editor: I am sending a peach twig covered with brownish plant lice, with a few black ones that have wings.—F. M. B., Hanford.

They are black peach aphids, which affect roots as well as tops. Get rid of them as quickly as you can, before they spread to other trees. Drench them with spray. Blackleaf 40, a pint per 200 gallons, with several pounds of common soap added to make it spread, is quite effective. In urgent cases, commercial distillate emulsion used strictly according to directions with a pint of blackleaf 40 per 200 gallons of spray mixture is more effective with the same carefulness of work. Repeat the spray a week later if live aphids are found, and again if necessary. Your chance to get all of them at one spray is nil. They are not likely to work on the tops after mid-summer, but go to the roots.

Apple Pointers.

In thinning apples, undesirable shapes and small apples should be removed because these retain their relative size and shape to maturity as observed by Prof. W. E. Whitehouse of the Oregon Agricultural College.

An even supply of moisture is needed by apple trees as judged by their habit of making steady gradual increase in size from beginning to maturity, a little faster in the later stages.

APPLE APHIS.

To the Editor: I am sending some young leaves from an apple spur, which are infested with both green and brownish plant lice.—F. E. W., Byron.

They are green and rosy apple aphids. Spray at once with blackleaf 40, one pound; dissolved soap, one gallon; and water, 198 gallons. Many will already be protected from any spray by curling the leaves. Distillate emulsion used at strengths recommended by manufacturers will be safe and effective.

Ground has been broken for the buildings of the F. E. Booth cannery, which is to be erected on a site of five acres owned by the company at Centerville.

Feasible Spraying for Citrus Trees

Are you a citrus grower anxious to produce the best crops possible at the lowest cost necessary to insure quality fruit and healthy, long-lived trees?

Then there is dollar-making information for you on every page of our new book, "Spraying Citrus Trees for Control of Insect Pests and Fungus Diseases."

Exact scientific tests of years' duration on several thousand acres of orchard have conclusively proved that spraying with a COMBINED INSECTICIDE and FUNGICIDE of the Proper Chemicals is Feasible, Efficient, Profitable and Thoroughly Satisfactory.

Our book tells the proper kind of sprays and when to use them. Comprehensive tables show how much spray material is required per acre, no matter what formula is used.

We will send it to you free if you will send us your name, address and number of acres in grove. Write

Bigger Crops by Blasting

"The O'Connor prune orchard in the Santa Clara Valley was blasted in 1913," says the California Cultivator. "Its largest crop in six years was 3,900 pounds. After blasting the crop was 8,000 pounds—more than double—in a dry year. The prunes from the blasted orchard were much larger and the trees made a better growth." By using

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

in your orchard you can increase your crop, add to the water-storage capacity of the soil, and enable the roots to feed on fresh plant food in the subsoil.

Hundreds of fruit growers in all Pacific Coast States plant their trees in beds made with Giant Farm Powders. They have found that trees in blasted ground grow faster, bear earlier and yield better than those planted the old way. They use the Giant Farm Powders because these powders loosen and powder the soil instead of packing it. Ask your dealer for either of the Giant Farm Powders—Eureka Stumping Powder or Giant Stumping Powder.

Free Book on Fruit Growing

Every fruit grower will find valuable information in the Giant book, "Better Orchard Tillage," written to suit Pacific Coast conditions. It tells and shows how to plant trees and subsoil orchards in the most effective way. This handsome illustrated book—or others—free. Mail the coupon.

Blackberry Laterals Now for Next Crop

[Written for Pacific Rural Press.]

Begin this summer to get your next year's crop of Lawton blackberries. This is the practice around Sebastopol, Sonoma County. M. J. Moniz, for 21 years foreman of the Barlow ranch, points out that the more "side shoots" and laterals you get this year, the bigger main crop of berries you get next year. He gets the laterals by summer pruning. "A good Lawton cane should have six or seven side shoots; and each of them should have three or four laterals."

When quite a few of this year's canes get four to four and a half feet tall, Mr. Moniz cuts off their tips and they shortly begin to throw out "side shoots" or primary laterals. When a few of these are about 14 inches long and many other shoots are projecting above the fruit-bearing canes, the laterals are tipped and the shoots cut back to about four and a half feet tall. This will be early in July, about the time berry picking commences. It helps clear the way for pickers. At this time, too, the weaker shoots are taken out entirely; for only seven to nine shoots are to remain in each hill for next year's crop. Nine can be left profitably on good soil if their plumpness indicates vigor. If the canes generally are slender, fewer will be left. The summer pruning will help prevent growth of surplus canes which would have to be cut out in winter and would make

more of a mess to clear out, besides wasting the vine's energy.

At the third summer pruning, about August 1, remaining new shoots are tipped, and about a third of the length of the previously unpruned laterals is taken off. Whatever other pruning will be required is done after December 1, while vines are dormant.

In all the summer pruning, lower laterals are cut shorter than upper ones in order to permit closer cultivation in the following season.

NAPA FRUIT PLANTING.

Napa county has planted lots of prunes, pears, and cherries, according to a report of the past season's inspections by Horticultural Commissioner John J. Fox.

French prunes lead by far, with 94,148 trees on myrobalan, 5,000 on almond, and 1,895 on peach roots; Imperials, 23,237 on myrobalan and 1,000 on almond; Sugars, 8,708 on myrobalan and 1,500 on almond. Nearly 152,000 myrobalan seedlings were brought in. Over 28,000 pear and 2,000 apple trees were received, of which 13,505 were dipped in blackleaf 40 and soap 1 to 800 for insects. Japanese pear seedlings are the favorites, for 119,000 were imported for their blight- and aphid-resistant roots. Cherries numbered 13,626 besides over 10,000 Mazzard seedlings. Peaches numbered nearly 5,000, walnuts 1464, almonds 1,009, apricots 4,098, vines 43,643, and berries 12,130 plants. The stock was very free from pests and diseases, for only about 1,800 were condemned.

Army of Food Supply and Preservation

The nation has entered on a state of war. A great army is being raised.

Just as vital as an army is a universal enrollment of patriots for maintaining and increasing the food supply to feed our soldiers, our people, and our allies, a problem intensified by the exhaustion of surplus foods.

There are fields of honor behind the guns, where glory and distinction await our brave boys. But in this crisis we should not forget that the waving fields of wheat, the rustling leaves of the corn fields, and new acres of even the humble bean and the needful sorghums are likewise fields of honor.

The men, women, and children who stay at home, and through endeavor and sacrifice do their bit, are soldiers of the common good, fighting to win the war.

"More food, less waste," is the slogan. Who shall the soldiers be to follow this cry?

To raise more food there must be new workers on the soil. Farm workers are lacking. Who are to do the work? Who are to garner the crops now growing? Shall they be saved or lost?

I have a suggestion for the Council of Defense and for the State Board of Education: Boys and girls can help with many crops, and must help, or wind and weather will waste our crops as surely as would an enemy's armies.

It's no easy job to pick prunes, or pull beans, in the hot California sun. Yet, as our source of help, boys and girls and men who cannot be soldiers, and women who cannot be Red Cross nurses, can play an honorable part.

This service should be recompensed not merely by money, but by more. I say that every boy and girl who volunteers in the "Army of Food Supply" be now given a certificate of enlistment, and when vacation is over each one who has helped by giving twenty days or more to the Cause be given a Service Button, these to be given out when schools reopen, upon proper credentials by their teachers, the Council of Defense to arrange the rules and provide the buttons.

How many boys and girls would wear this emblem with pride! Not all can work in the fields. What can the others do?

We need an Army of Thrift. Was there ever more need of fighting waste? Children of all ages can help.

I would have every school boy and girl within the next month write a composition on "Fighting Waste." The school teachers can mobilize their minds and suggest ways and means of thrift. Every family that buys coffee and tea or beans in cans today, instead of in bulk, is wasting the tins that should be used for more necessary products. For there isn't enough tin to go round. Every boy or girl who can keep three or four hens or rabbits to use the garbage is helping feed his family and the nation. Every boy or girl who can raise a back yard garden is helping the nation.

I suggest that every child who shall report actual service in thrift be given, this fall, a button of the Junior Army of Thrift.

What family is there that would not feel the call, and fail to respond lest their boys and girls be thought slackers!

Martinez.

FRANK T. SWETT.

We are facing a world wide food shortage. For the sake of the hungry world as well as for the good of your bank account you ought to make every foot of your land produce its utmost. You can't possibly do this without fertilizing. Germany's crop failures for the past two years have been largely due to her inability to secure proper fertilizer materials.

GOLD BEAR FERTILIZERS

Are made from Animal products that contain the elements necessary to meet California soil conditions and crop requirements.

Remember that fertilizing is not an expense but an investment that will bring big, sure, and quick returns.

Let us help you make your land produce the biggest and best crops possible.

Late or Early Cover Crop Plowing.

[Written for Pacific Rural Press by W. M. Mertz, Citrus Experiment Station, Riverside.]

The question of the time of plowing under a cover crop is still one on which there is a difference of opinion among growers. Some still believe in letting the cover crop become mature before turning it under, which means that it must be left until late April or early May. Where thorough irrigation can be given, a cover crop may be so left and still properly incorporate into the soil. There is no doubt but that a larger amount of organic matter is obtained by permitting the crop to mature than by plowing early in March. However, with a heavy cover crop you must consider not only the question of maintaining proper moisture content for plant feeding, but also the question of available plant food for the tree crop while the cover crop is still growing. As a general thing, with matured trees it seems unadvisable to permit the cover crop to grow long after the new growth on the trees has started out. I know of one instance in particular, where purple vetch was permitted to mature and where the water content was maintained satisfactorily, but where the trees became pale and yellow and showed every indication of starvation. A legume is frequently thought to have ability to add nitrogen to the soil while it is growing, but such, if it is the case, seems to be a small item with citrus trees. The greatest part of nitrogen contained in legumes is present in the tops; and until these are turned under and have decomposed, not only the nitrogen which has been added from the air but also a considerable amount that has been taken from the soil and held locked up in the plant tissue of the cover crop, is totally unavailable to the tree crop. With young trees, where only a small portion of the soil is occupied by their roots, the main bulk of the cover crop may be permitted to mature without in any way affecting the tree development. It is wise, however, to plow two or three furrows on both sides of the trees early in the spring in order that moisture and plant food may be supplied plentifully to the trees themselves.

SUMMER COVER CROP OF BEANS.

If the matured cover crop has been worked up in early May the land may be again planted to some other legume such as beans; and a summer crop grown and harvested

FLOW WALNUTS LATER THAN CITRUS.

The question of the time to plow under a cover crop with walnuts is one upon which I am unable to give any experimental data. The walnut, being a deciduous tree, starts in the spring on stored food so that it would seem that this tree would not necessarily begin drawing heavily on the soil as early as would the citrus tree. This would probably permit plowing somewhat later than we feel is the best practice with citrus. This is also a great importance in the case of walnuts because of the fact that it is necessary to sow the seed later in order to put the crop in after the walnuts are harvested. With citrus fruits, where more or less picking is going on during the winter months and in some cases orchard heating as well, it is seldom that the orchards are in fit shape to irrigate in the spring even though they were permanently furrowed in the fall. A great many orchardists have come to feel that a cover crop is a bad proposition solely because they waited too long before attempting to turn them under and with a very mediocre job of irrigation, felt it a very expensive and laborious task to get the ground worked up in the spring. In fact, this has been especially noticeable during the past two seasons, when spring rains have been absent. For this reason alone, it seems that it is not advisable to set a later date in the spring than will permit finishing the plowing of the orchard by the middle of March.

No Set Rule can be made for all conditions; and there are some sections where thorough irrigations can be given and where climatic conditions are such that trees start later in the spring where such a rule might work to the injury rather than to the benefit of the orchard, but as a general rule it would seem that the spring work could be materially benefitted by beginning earlier than is now being practiced.

BEE BEGINNERS MUST KEEP COOL.

[Written for Pacific Rural Press.]

We were invited one cold day to put a hand into a hive full of bees from which the super had just been removed after a light smoking, to see how much heat the bees generate and get advantage of in a good hive. It took some nerve at that time to do it, for at once the bees began crawling over the hand and one or two got on the back of our neck. The hive truly was warm, but gentle notions and an appearance of not being afraid prevented the bees from getting suddenly hot. Beginners with bees are prone to excite the insects by nervous motions, and then there is something doing. Every bee man must bear in mind: "Keep cool and your bees are most likely to keep cool."

One of the most interesting features of the Third Annual Butte County Spring Exposition to be held in Chico May 21 to 26 will be the Boys' High School Agricultural Club contests.

"The Schmeiser Way Makes the Farm Pay"

Los Angeles Will Have a Great Fair

[Written for Pacific Rural Press by Cuthbert Powell.]

The long-cherished hope of an old-fashioned agricultural and livestock fair in Los Angeles is at last to be realized. The State Legislature, just before its close, appropriated \$50,000 towards assisting its establishment, which assures its success. The city of Los Angeles and its business men will add greatly to this amount and

there will be ample room for all exhibits.

As an adjunct to the park there is a playground covering seven acres, where visitors can take their little ones to rest. There are also large picnic grounds, where visitors can eat their lunches. A more admirable location and prettier grounds cannot

nounced, yet it is understood that he will accept the appointment and that he will assume control of arrangements very shortly.

The time for holding the fair is set for October and will last thirty days. A week will be given to cattle, hogs and sheep, a week to horses and a week to poultry and pet stock, while

the nearby counties to draw exhibits from and the rich portion of the State a little to the north of us, which may be expected to lend a helping hand, Los Angeles enters the show business this year with the fondest hopes and feeling that its fair in future years will become one of the great annual events in the livestock

The above illustration shows the beautiful entrance to the Los Angeles Agricultural and Livestock Fair Grounds.

the premiums offered are expected to be generous ones and sufficient to draw liberal and handsome exhibits. While it is designed to bring together in exhibits and attractive displays the best in southern California, meritorious entries from elsewhere will be welcomed. Livestock of all kinds, field crops, fruits and vegetables, poultry and pet stock are all to be brought together and housed in buildings designed for their best display.

The fair is to be under the auspices of the District Fair Association and is to be held on the grounds of the Exposition Park, a beautiful park and expensive buildings owned by the state and county and representing an expenditure of \$2,400,000. The park contains 130 acres and is located at the intersection of Santa Barbara avenue and South Figueroa streets, within easy reach of the business section of the city. It can be reached by nine different electric car lines and there are in addition to these lines of travel excellent automobile boulevards reaching from all directions to the center of the Exposition grounds. These in themselves, with their flowers and shrubs, are worthy a visit.

Besides the state building, a two-story fireproof, tile-roof structure constructed of tapestry brick, trimmed with terra cotta, is the Los Angeles County Art and Museum building, another handsome fireproof structure, filled with art treasures and curios and the skeletons of wild animals native to California now and during prehistoric times.

The State Exposition building, in which the agricultural and horticultural exhibits are to be housed, is three hundred and twenty-five feet long by one hundred and thirty-five feet wide and has more than fifty thousand square feet of floor space, so

be found in the country. The people of Los Angeles appreciate the advantages thus possessed and are entering into the fair business with a determination to make the most of them and win success and permanently establish here in southern California one of the greatest annual fairs and livestock shows in the country.

Livestock will be the predominant feature of the fair. Liberal space will be given and appropriate buildings erected for the accommodation of the livestock exhibits. While cattle and horses will be the leading features of the livestock show, hogs, sheep and goats all will be provided for in the premium list, and an effort will be made to have full representations of all. It will be the only big livestock show ever held in southern California. While it will be primarily a California show, meritorious exhibits from outside the State will be accepted.

The fair association is headed by C. E. Miller of Los Angeles as president, and associated with him are one hundred and fifty of the most public-spirited men of southern California, who have agreed to give both time and money to make it a success. Premiums, while not yet agreed upon, it is said will be large and attractive, as ample money has been assured for prizes.

Every department will be under the superintendency of an expert. Livestock that will be especially featured is expected to be under the management and control of one of the best known cattle show men in the country—a man who has had years of experience in the caring for and management of livestock in the show ring and is popular both with the public and exhibitors. His appointment has not been officially an-

agricultural and horticultural exhibits will run through the life of the show.

It is being established along broad-gauged lines and will be an annual affair, and it is expected to be broadened out with each succeeding year.

With the Imperial Valley, with its big livestock interest and wonderful crop possibilities right at our doors, the great vegetable and fruit crops of

and agricultural world of the Pacific Coast.

The light showers in Southern California last week brought the rainfall of the season up to the following: Los Angeles, 15.65 inches; Redlands, 12.87 inches; Riverside, 8.85 inches; San Bernardino, 13.68 inches; and Santa Barbara, 22.46 inches.

The big feature in motoring. An all-refinery gasoline—not a mixture.

More Land to Be Irrigated.

Over 300,000 acres will be added to the irrigated area in 1917 by 86 out of about 450 irrigation companies in the State according to Prof. Frank Adams to whom the 86 companies reported. If the other companies do proportionately, said he, 1,000,000 acres could be added to the irrigated area this year. The Railroad Commission is to issue permission to public utility water companies to furnish water free, or at reduced rates, to stimulate food production during the war.

Plant Lice on Vegetables.

Practically all plant lice on all common vegetables can be controlled by using the same spray. Whether it will pay to spray depends on the value of the crop. Twenty-five cents worth of blackleaf 40 will make six gallons of spray. A little soap added will make it spread better to lice protected by folded leaves, etc., but don't make the mixture sudsy. This strength will not hurt any garden vegetable or ordinary flower plant. Drench the plants to make sure the spray touches all lice, and repeat the spray a few days later.

Early Sown Grain Best.

Wheat and barley sowed last November on summer fallow in San Luis Obispo county, was reported May 3 by Benj. Quigley to be showing heads four inches long on plants over three feet high. Grain sowed in December is less than half a stand because there was not enough rain to prevent the ground baking; so plants could not come through. One field in finest kind of tilth has only one-third of a stand, now enormously stooled, because it was sowed late. Mr. Quigley has never lost by sowing early, for grain is harrowed with the spikes vertical any time after it is well up, until it begins to joint so it would break off. This keeps down the weeds and prevents the surface from crusting. It enables the grain to be planted before rains and to shoot up as soon as they come. The dragging does not injure even barley, the most shallow-rooted of the grains.

Artificially Ripened Onions.

Last summer some San Joaquin onion growers got onions for early shipment and high prices by smashing down the tops to check growth for a few days, then digging the onions and allowing them to dry in the field a day or two, covering them with the tops to prevent sunburn. They thought they were getting high prices at \$2 per sack.

Poison Celery Spray.

Bordeaux spray must be applied to prevent celery blight; but if carelessly applied, is likely to leave enough copper in the bunches to be injurious to health and to get Uncle Sam on your back. Spraying with too little pressure results in the spray running in streams down to the base of the stalks, where it dries leaving a greenish color. Spraying with a mist nozzle and 150 pounds or more of pressure makes a fog which settles on the plants without running down. Washing the stalks

carefully before eating removes the poisonous copper.

Sweet Potatoes.

To the Editor: I have ten acres in San Bernardino County suitable for sweet potatoes. Where can good plants be obtained? Which are the best varieties to plant for market? What is the best way to plant, on ridges or level?—W. A. D., Los Angeles.

California Sweets are standard and may be obtained from your local seed companies or raised from sweet potatoes bedded in sand. See our issues of March 24 and 31. Plant with a sweet potato planter on ridges so irrigation water will not touch the young plants.

Hubbard Squashes.

Answering a subscriber's query, a reliable commission man gives his opinion that Hubbard squashes ought to be at least double the usual price during the coming year. They are usually sold between November 15 and January 1 at one to 1½ cents per pound. They are worth now up to four cents per pound. Many Hubbards are shipped to the North-

ern Pacific States, and this demand is a strong factor in prices. How to preserve Hubbards for spring prices will be told in Pacific Rural Press in time to make the preparations.

Alternate Early and Late Peas.

In planting early and late peas, put them in alternate rows, not over a foot apart. They will not crowd each other seriously until the early peas are out of the way, when the late peas will have double space.

Transplant Thinned-Out Vegetables.

Where seeds of beets, onions, lettuce, etc., have germinated so well that the stand is too thick, thin out, leaving the strongest plants spaced if possible to allow them to grow just the size desired, then transplant the others. You may find the transplants ahead of the others within a few weeks. It is claimed that they make better, more compact root systems. But fleshy-rooted vegetables may go to seed if transplanted after making considerable growth.

Stake Garden Tomatoes.

Space for tomatoes will be saved, less fruit will rot or become distorted or diseased, and cultivation will be made easier by staking tomato plants and pruning off all but the central leader until it is four feet tall.

He'll Make You Poor — KILL HIM

What is the use of preparing a good seed bed and planting seed that cost good money if you let squirrels and gophers eat your profits. These pests are a constant danger to crops and a constant menace to the family's health.

Carbon Bisulphide

has for over 30 years proven to be the most effective—the only sure killer of squirrels, gophers, rats, prairie dogs, ants, moles, yellow jackets, moths, weevils, lice, etc. It is easy and safe to use.

San Francisco

California

These Redwood frame dwellings, at 20th and Mission Streets, were scorched, but refused to burn, thus preventing a further spread of the big San Francisco conflagration of 1906. The telephone poles are also Redwood.

The safest wood you can use

Uncle Sam says, in the United States Forest Service Circular No. 193:

"Redwood resists fire well, and even when ignited burns very slowly. It checks but little when exposed to the sun, and is practically free from resin. These properties make it especially suitable for use in buildings."

Chief Engineer P. H. Shaughnessy of the San Francisco Fire Dept., after 22 years' experience with Redwood, including the big fire of 1906, said:

"ignites much less quickly" — "burns much more slowly" — "more easily extinguished."

Sounds like the kind of wood you should use for the new home, doesn't it?

Especially when you add that it *resists rot, will not shrink or warp*, is light in weight, easily worked and suitable for every inside and outside use except fine floors.

Railroad Preparing to Move Crops.

[Written for Pacific Rural Press.]

In our article of last week, regarding the prospects of getting California fruit to Eastern markets, we noted that the question would not this year be one of refrigerator car shortage, but there might be a lack of motive power. We now learn that the Southern Pacific Co. has placed an order for 11 additional locomotives for delivery in time for crop movement. The engines will be the largest on the system except the huge mallets which are really combinations of two engines. These locomotives will cost \$50,000 each, an increase of 50 per cent over the 1913 prices.

The Pacific Fruit Express, which furnishes refrigerator cars to all California interstate railways except the Santa Fe, is building 2,700 new cars which will be completed as soon as possible in view of difficulty in getting material. The Pacific Fruit Express already has a total of about 15,500 cars. The Southern Pacific is building 2,950 other freight cars to relieve any possible shortage. Their trouble is to get their cars back after sending them east with loads. The Western Pacific is building 200 ventilated boxcars for local shipments of perishables. They and the Salt Lake use Pacific Fruit Express cars for refrigerated shipments. The Santa Fe, which has its own refrigerator car line, is building 850 new cars to add to their total of over 9,000; but the new ones are not likely to be ready in time for our early fruit crops.

DEMURRAGE.

The railroads generally feel that

they have enough rolling stock to care for all demands, provided cars are not used as warehouses. They urge shippers here and receivers East to load and unload promptly to avoid car shortage. To help this movement in the East, on May 1 demurrage rates were raised 100 per cent, to \$2 per day, after the first 48 hours, for four days, and \$5 a day thereafter until unloaded. In California the old rates are likely to continue \$3 per day after 48 hours from the time cars are spotted for loading or unloading. Cars in transit can be held only 24 hours free for additional loading.

INCREASED 1½ TONS PER ACRE.

[Written for Pacific Rural Press.]

Stable manure made about 1½ tons difference per acre in the yield of dwarf milo planted last May by M. M. Sweeney of Imperial County.

"My neighbors gave me all the stable manure I wanted. On one stretch I piled it about three inches deep and plowed it under about April 1. I planted about two pounds per acre with a corn planter, putting it about two inches deep and in rows 36 inches apart. I irrigated at once, and twice later. I cut it short in the middle of July, when it was about seven feet tall, and took off 2½ tons per acre. The stubs grew again till about three feet tall; then I pastured that," says Mr. Sweeney.

"The part where I didn't fertilize produced only one ton per acre and grew only 3½ feet tall. It headed out 10 days later and the seed was not so fat as on the fertilized milo."

GIFFORD PINCHOT SEES THE FARMERS' DUTY.

To the Editor: In this great time, when every citizen must do his part, the President has made his chief appeal to the men who live on the land. He is right in doing so, for the safety of our country just now is in the hands of our farmers. The safety of the United States against foreign invasion hangs on the decision of the farmers of the forty-eight States.

The two great weapons in this war are arms and starvation. The war against German arms will be won or lost in France—the war against starvation will be won or lost in America. The Kaiser cannot whip the French and English armies and the English navy while England has food. But it is still possible that the German submarines may be able to keep food enough from reaching England to starve her into submission.

If the submarines win, the first item in the Kaiser's terms of peace will be the English fleet. With the English fleet in his possession, the Kaiser will be master of the world.

What will happen to us then? Every man who stops to think knows the answer. We shall have money, food, labor, land—everything that is desirable in the world except the power to protect what we have. Experts estimate that it will take us nine months to get ready to meet a German army of even 150,000 men, with modern artillery. Under such circumstances, would the Germans treat us better than they have already treated Belgium and France?

Even if the armies of our Allies should crush the German military power this summer, before the shortage of food can reach the point of want, the world would still need vast quantities of American food. But if they do not, only one course can make us safe, and that is to grow food enough on our farms for ourselves and our Allies, and to put ships enough on the sea to carry the food, in spite of the submarines, to the men who are fighting our fight.

If the war lasts beyond this summer, it will be the American farmer who will win or lose the war, who will overcome militarism and autocracy, or allow them to spread and control the world, ourselves included.

This is no fanciful picture, but sober fact. Many a man will make light of it until he comes to think it over, but I venture to say that few will treat it lightly after careful thought. It is no more impossible than the great war itself appeared to be, only a few days before it began.

It is true that we can greatly increase the available food supply out of grain now used in making liquors, and by reducing household waste. But when these two things are done, and done thoroughly, they will not be enough. The final decision will still rest in the hands of the men who raise our food in the first place.

The clear duty of the nation is to guarantee the farmers a fair price for their crops when grown, and a reasonable supply of labor at harvest. The clear duty of the farmer is to raise food enough to win this war for democracy against Kaiserism.

No such responsibility has ever rested on any class of men since the world began as rests today on the farmers of America.

BEES GOOD INVESTMENT.

For capital invested and labor required, bees are far the greatest money-makers one can keep on the farm, says Francis Jager of University Farm, St. Paul. One hundred pounds is a fair average production under good management of the bee yard. At this rate 100 hives would produce 10,000 pounds of honey in one year. This, at 10 cents a pound, would give a return of \$1,000 for one year.

None of this has to be used to pay for feed for the bees; for all their food and honey come from the flowers of the roadsides, woods, and meadows. Little or no rent is required for the land, for the bee-hives can be placed along roadsides and in meadows where the bees have food at their very doors.

If a yard is needed for the bees a quarter of an acre is more than enough for 100 hives. This should cost \$1.50 as rent.

The only large expense is for equipment such as hives and supers, and this equipment will last a life-time. It can be supplied for \$300. This means a yearly charge of only about \$15. The bees can be obtained free by catching swarms in summer. Then by the use of purebred Italian queens, obtainable at the University Farm for 50 cents each, these swarms can be multiplied into a purebred apiary. The total annual cost of the bees for one year, then, is less than \$20, exclusive of labor.

SEPARATING MOLDY GYP.

[Written for Pacific Rural Press.]

When grains of all kinds are high the hog feeder is faced with the problem of utilizing those grains which are unsuited for other purposes, and which are as a consequence selling below their market value. When we visited the ranch of A. M. Bibens of Stanislaus County this spring he was finishing a bunch of market hogs on Egyptian corn that he had secured below the market because it was harvested late and was rather moldy as a result.

To separate the good corn from the poor before feeding, he was soaking it in a tub of water for about two days before feeding, the moldy corn coming to the top in that time so that it could be skimmed off and thrown away. This occasioned only a slight loss in pounds of corn thrown out and insured good clean grain for the hogs.

FOR EXCHANGE

KILLEFER
QUALITY

Model Bean

KILLEFER
EFFICIENCY

Cultivator

This Cultivator, like most of our implements, has been developed at the request of Dealers and Ranchers for a strong, simply controlled cultivator, capable of doing their work deeper and better than possible with the light Eastern-made tools. The frame is one piece of high carbon steel without joints to work loose or sag and holds the wheels always true and in line with the rest of the machine. The double frame bar gives ample clearance between the standards and eliminates the tendency to clog in trashy ground. This frame bar has a double lifting device which holds it rigidly on both sides. A man's weight on the extreme end will not spring it out of line. The seat is set far enough back to give an unobstructed view of the rows and the foot control is very easy on the driver.

An important item for the Bean Growers' consideration is that all parts and repairs are easily and quickly obtained without the delay of sending East for them.

Place Your Order Early.

City Folks, Get Busy or Starve!

[From address by Albert Lindley at California Development Board Meeting, Stockton.]

You from the city now say to us farmers: "Go work," but you give us nought with which to work, in extensions, reductions, machinery, or labor to encourage our increased endeavor. You seem to forget that the average frugal, industrious farmer cultivates every foot of good ground he can buy or rent that it is possible for him to get the money or labor to properly handle. Still, farmers are not going to allow themselves to be carried into wild farming, or wild finance by pleas or propagandas that advocate increased acreage, out of season planting, expensive improved machinery and experimentation in untried crops without being shown where in thrift and sound business policy the same may be undertaken with reasonable prospect of success.

GOVERNMENT FARMING.

A newspaper clipping tells a plan which I propose:

"Albert Lindley, who owns and farms the major part of Rough and Ready Island, has offered to undertake the farming of a thousand acres of land in California, the product of which shall go to the army, navy and the allies. He has further agreed to undertake to secure the services of a hundred other successful farmers on the Pacific Coast as volunteer supervisors of farming operations on tracts of similar area.

"Lindley has even gone a step further than this, and, pointing out that there are 12,000,000 acres of farming land in California now lying idle, he has volunteered his services in securing the land for this purpose by arranging to have large landholders of California lend to the government portions of their lands in tracts of substantial size. This plan comprehends the provision by the government of all necessary implements, stock and seed, and that the entire cost of operation will be borne by the government under the supervision of the Department of Agriculture."

Get real farmers together, furnish them the land and a tractor, horses and tools, stand behind them with money and labor and our country and our allies will be fed and fed from the first crop that the land and the locality is adapted to produce.

MESSAGE TO THE CITY.

For the farmers I would like to send this message to the people of the city: "Don't waste your time worrying about whether we farmers will feed you and them, but get busy, do something, make some sacrifice yourself."

We ask the banker, the labor leader, lawyer, merchant, doctor, and commission man what, if anything, you are doing for your country, or what you will do for the farmer if he meets disaster through allowing himself to be exploited by you beyond his sound business judgment on the plea of patriotism.

Mr. Banker, your stock is quoted at fabulous prices and earning 20 per cent. Will you reduce our interest, or extend us more credit should we jeopardize our life's work that we may produce more food products for our army and navy that protect your securities?

Our government has most properly arranged to loan our allies three billion dollars at three and one-half per cent with little or no security. Are you going to hold us at seven and still demand security that would be accepted by a Kearny street pawn broker, while at the same time asking us to speed up our farming be-

yond our conservative judgment?

If the war should suddenly cease and prices drop or crops fail, are you patriotically coming to our aid and extend our time or pass our interest?

DEPENDABLE LABOR.

Mr. Labor Leader, you ask us to plant more crops, for our country's sake, and for the sake of the stalwart men you represent, that we may compete with ourselves by lowering the price of food stuffs, and all this, when we have a big, live mortgage on our farm that by years of economy and hard labor we have never been able to reduce, much less liquidate. What are you doing to help us with labor? We pay two-fifty a day for unskilled labor that has but little or no expense to meet. Yet, we can find few dependable white men to work the land we now farm, and by reason of your efforts we have laws that prevent us getting outside labor. We don't want Japanese, Chinese, Hindus, nor aliens of any other country, and I don't make a practice of employing Asiatics on the Lindley farms. We want English-speaking white men who can be made to understand our wishes, and do intelligently what they are set to do. But we can't get them, and what we generally get are floaters that know nothing of farming or stock.

Give us decent, dependable labor, not loafers, as the larger part of those who now offer us their services are. Solve that question, Mr. Labor Leader, and we farmers will solve for you and your people the question of shortage of food products and the high cost of living. With us the question is not what we pay for labor, but what we don't get for the money we pay. Do you get that?

One prime reason for the scarcity of food products and consequent high prices is, we cannot get enough honest, industrious, dependable labor, white or Asiatic to properly care for the land we now farm, and the crops and stock we now raise. You can have your choice: Continue to pay high and still higher prices for food. Furnish us with more and better white labor that we may, with safety farm more land. Or the hungry people will open the doors to Chinese and Japanese, now practically our allies, as a war necessity.

PREVENT SPECULATION.

Mr. Merchant, if in the late raise of six dollars on hay rakes and other implements in proportion, are you trying to increase the food supply and decrease the cost of living? Does the fact that in Europe they are using but few hay rakes tend to increase the demand and raise the price just before our harvest season? Are you, Mr. Merchant, one of the patriots that is urging the farmer to plant greater acreage?

FAIR LAWS NEEDED.

We ask our statesmen, how you discovered the rabbits that eat our crops needed protection. Yet you have never been able to discover a cure for the deplorable fact that the consumer in Stockton often pays over one hundred per cent more for my products than I get for them four miles from town.

Have you ever tried real hard, Mr. Statesman, to find the bug in the commission business. I don't mean sure enough commission men so

much as I do the commission men who do business alone on warehouse receipts, the gambler who never takes a chance. Look him up, Mr. Statesman, if you want to loosen up and lessen the price of some of the food products.

Mr. Statesman, while devising ways to increase the food supply, stop and ponder over the result of the laws you have placed on the statute books in past years, to curry fa-

vor with the anti-railway populace that you might be perpetuated in office. Centralize your power of regulation and give railways definite

CHUBBUCK'S IDEAL GOPHER TRAP
Larger than runway: jaws pull rodent in: catches large or small gopher and holds it. Farmers say it's worth dozen other makes. Big sales. Price 50c. If not at your dealer's write and send 2 to you postpaid; 2 for 95c; 6 for \$2.50. 12 for \$5.00. Money back if you are not satisfied. See catalogue. E. J. Chubbuck Co., Dept. B, San Francisco, Cal.

AN INADEQUATE SUPPLY MAY RUIN YOUR VALUABLE CROPS

Uncle Sam depends upon YOU to do your utmost in producing the largest crops possible. Prices will be higher this year than ever before in the history of the country. It is your duty to be prepared. Take no chances of ruining your crops because of an inadequate water supply. Install the Layne & Bowler Pump and be absolutely assured of success. Our Catalog No. 25 gives full details. Yours for the asking.

LAYNE & BOWLER CORPORATION

900 Santa Fe Avenue

Los Angeles

WHAT ABOUT YOUR IRRIGATION PIPE?

Owing to conditions existing in the iron market and also to weather conditions, we suggest you order early.

AMES IRVIN IRRIGATED PIPE.

We have a complete stock, and can make immediate delivery. AMES IRVIN PIPE is solid and strong, with no holes in steel. Each sheet is edged-locked together, and then set down under 3500 pounds pressure. Such seams will not break or leak. Send for booklet giving complete information about Irrigation Pipe and its construction. Get it today.

AMES IRVIN COMPANY

8th and Irwin Street,

San Francisco

Lock Seamed and Soldered

There is a tremendous difference in surface pipe. This is appreciated most by the man who has wasted time and money on inferior makes. If you want absolutely the strongest and best surface pipe you can buy, select

Madewell Surface Pipe

It has many distinctive important advantages you can't afford to overlook. The Madewell Long Lock Seam is made doubly sure and strong by soldering the entire length. A better seam can't be made. The Madewell Lock Seam Sleeve—used in Madewell pipe only—is decidedly stronger and smoother than the old fashioned lap and riveted seam used in other pipe. This feature alone puts Madewell Pipe in a class by itself.

Send for Free Booklet—which tells just how Madewell Pipe is constructed

Robinson Hardware Co.

Box B.

Gilroy, Cal.

laws that will cover a period of years and they will extend their lines into rich and productive territory that will at once be settled and cultivated by the farmer. It is a sure thing, if railway extension and land development does not keep pace with your increased population, the people must suffer from a scarcity of food products.

We are farming practically all our prepared and irrigated land. If we farm more, it must be prepared and

irrigated, or crop failures will follow. For this preparation of added land, the farmer must have more and cheap money. He must have more and dependable labor. He must have improved machinery at reasonable prices, and above all else you must place the plan of increased production in the practical farmers' hands, under government supervision, and then all of you aid and support that plan when perfected and placed in operation.

CRITICS' AND CUDDLERS' CORNER

Subscribers are welcome to praise or to condemn (in letters of not over 200 words) anything which appears in the reading columns of this journal. Contributors to this department may drive and counter-attack each other as they see fit without endorsement or response on our part.—Editors.

Wants Government Charity to Begin at Home.

To the Editor: We join in appreciation of your editorial in issue of April 21. You know whereof you speak, "Mobilization," particularly appealing to us. Could our government aid farmers as it is aiding the trim and dapper gentlemen now visiting our shores in apparent humility and surely desperate appeal, gentlemen who have heretofore sneered, cojoked, and honored us in Europe by placing our representatives on gala occasions, not at the head as befits the First Nation of the earth, but down past every India potentate, petty prince and nin-com-poop, some 51st in line? I say, could we be assisted by water conservation, electric power, etc., etc., the boast of helping humanity in a concrete fundamental way would then be a reality. — May F. Herold, Placer County.

His Oranges Sweet.

To the Editor: A neighbor has shown me a copy of your weekly of March 24, in which you have printed a portion of the article I wrote concerning his crop of oranges. Instead of denouncing the robbery of which he had been the victim, you say: "The oranges were generally sour and poorly colored. I say from actual knowledge that you are mistaken. The oranges were shipped between November 18 and December 19, inclusive, and were beautifully colored and A1 in all respects. You also say: "This grower got 42 per cent by selling outside the Exchange." I am informed that the Fair Oaks Fruit Co. is a member of the Exchange. I sold my oranges through it. Here is what I received:

383 lbs. No. 1 oranges @	
.0213 cts. per lb.....	\$ 8.16
2185 lbs. No. 1 oranges @	
.0089 cts. per lb.....	19.45
131 lbs. No. 2 oranges @	
.0185 cts. per lb.....	2.42
506 lbs. No. 2 oranges @	
.0071 cts. per lb.....	3.59

Total\$33.62

Eighty per cent No. 1 oranges.

Not enough to pay my water tax. If that is a fair sample of Exchange selling my first and last experience is ample.—A. Chapman, Sacramento County.

Need Vegetable Articles.

To the Editor: I accept your invitation and take my first "slam" at the managing editor. The Pacific Rural Press has been forever preaching: "Don't waste this opportunity" in planting, cultivating, spraying, breeding, etc., etc. Always, at the same time, saying the farmer must and is working full capacity. These are great and good. The "Press" has, and is, doing much to solve the perplexing problems. But, an ounce of preventive is worth barrels of insecticides. So why not this: The most important part of any farm is the home garden, large or small; take this off any farm and the whole industry stops—or the family moves away. If the Pacific Rural Press should devote one page to this department in a manner as thorough as the courses now available at the University of California, there will be more and better food

for thousands. Few men can toil each day from early till late and take the added time of study and writing to do justice to themselves with the extra duty of taking the University of California course, while if the same information could be had at the time we read the Pacific Rural Press every point would be devoured and filed away as valuable treasures, indexed for reference together with all the hundreds of other lines of valuable information. —Harrison Mitchell, Amador County.

Night farming in England, now becoming rather general, is proving quite successful.

Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her FREE Homestead lands of 160 acres each or secure some of the low priced lands in Manitoba, Saskatchewan, and Alberta. This year wheat is higher but Canadian land just as cheap, so the opportunity is more attractive than ever. Canada wants you to help feed the world by tilling some of her fertile soil—land similar to that which during many years has averaged 20 to 45 bushels of wheat to the acre. Think of the money you can make with wheat at over \$2 per bu. and land so easy to get. Wonderful yields also of Oats, Barley and Flax. Mixed farming in Western Canada is as profitable an industry as grain growing.

The Government this year is asking farmers to put increased acreage into grain. There is now a great demand for farm laborers to replace the many young men who have volunteered for service in the war. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or to

TO ALL DEALERS:

For your information we wish to advise that in our experiments and tests here at the factory with our new Eight Cylinder car, we have been able to secure uniformly better results with Standard Oil Company's Zerolene motor lubricant than with any other which we have used.

Please understand, however, that we do not wish this to be construed as an attempt on our part to dictate the brand of oil which you should use, but merely to call your attention to the fact that this particular brand has given us better results than any others which we have tried, and are giving you this for your information.

Yours very truly,

THE PEERLESS MOTOR CAR COMPANY

BECAUSE Zerolene is correctly refined from asphalt-base crude, it maintains its lubricating body and value at cylinder heat, thus forming a perfect piston seal, reducing friction, and enabling the motor to develop its maximum power.

Zerolene is the oil for your car.

For sale by dealers everywhere and at our Service Stations.

General Agricultural Review

Field Crops.

Alfalfa is just getting a good start in Nevada.

Rice planting in Glenn county is practically finished.

In San Diego county the crop outlook generally is good.

Large planting of beans and heavy planting of vegetables are reported from Napa county.

Hay and cereals in Contra Costa county show an approximate yield of 50 per cent of normal.

A proposal has been made in Congress to include a tax of \$2.50 a bale on cotton in the war revenue bill.

Cutting of grass for hay has begun in the high meadows back of Novato. This is about two weeks earlier than usual.

The first cutting of alfalfa hay is being sold for \$15 a ton f. o. b. cars, Tipton, for shipment to the cities, according to reports from that section.

A cotton-growing experiment will be conducted near Ripon, San Joaquin county, this year by J. H. Ward and Farm Adviser R. D. Robertson.

A hay yield of 20,000 tons from the Crocker-Huffman Land and Water Company's Merced lands is the forecasted estimate for this season made by Superintendent H. A. Lage.

The tomato growers of California have generally contracted to deliver this year's crop of tomatoes at \$10 per ton, whereas the price throughout the East has been from \$13 to \$15 per ton.

Experiments with sulphate of iron for the eradication of wild mustard, under the jurisdiction of experts from State Horticultural Commissioner Hecke's office, were conducted near Davis this season. An experiment of one acre, with an unusual infestation, was sprayed with 100 pounds of iron sulphate resulting in more than 90 per cent of mustard being destroyed, and no injury to the tender grain plants.

Deciduous Fruits and Berries.

The Watsonville district produced in 1916 3,600 carloads of apples.

The prune crop of Tulare county is expected to be unusually good this year.

Apricot blight conditions in Kings county are being officially investigated.

Blackberries began to arrive in San Francisco from Southern California last week.

The crop of strawberries in the Riverbank section is heavy, berries large and of a delicious flavor.

A packing house will be constructed in Hanford for the California Peach Growers' Association.

Tom Henry, Horticultural Inspector, Paso Robles district, reports 5,027 acres of almond trees bearing and nonbearing in that section.

One canning company in the Turlock district has contracted for 25,000 tons of peaches, all of the apricots in the neighborhood, and about 1,000 tons of tomatoes.

A few cherries, the first of the season, Early Knights and Soft Whites from Vacaville, were on the Los Angeles market last week. They sold at 25 cents per pound.

The peach loss from the frost in Sutter county is confined to certain localities and mostly to the freestone varieties. From 15 to 20 per cent of a total is estimated.

County Sealer George McPhee of Santa Ana started a rigid inspection of strawberries last week in the market, and said that he would prosecute all short-weight box packers.

The Pacific Fruit Express has secured 1,500 cars from Armours and have also constructed 2,500 extra cars. This will give the Pacific Fruit Express 17,000 cars this season.

The California Peach Growers' Company has sent out a communication to brokers advising them that orders will no longer be accepted for unpeeled dried peaches of the 1916 crop.

Packages of perishable fruit such as berries and other soft fruits offered for shipment by parcels post should be inclosed in a container of sufficient strength to prevent being crushed and should be marked "perishable."

The Fruit and Markets Committee of the San Jose Grange, at a recent meeting, reported that offers of 7 cents a pound are being refused for dried prunes, 18 cents for dried apricots, 14½ cents for dried peaches and \$80 a ton for green prunes.

A thousand American, Italian, Japanese unskilled workers met recently in San Jose to promote the interests of the new Federal Labor Union. Their object is to increase the pay of fruit workers to \$2.50 a day for men and \$1.75 for women, with extra pay for overtime. Ten hours constitutes a day.

Arthur E. Beers, Horticultural Commissioner of Merced county, sends the following list of trees and vines planted in Merced county, season 1917: Grapes, 1,131,383; almonds, 42,145; cling peach, 24,481; figs, 7,584; freestone peach, 5,047; apricots, 4,971; prunes, 2,502; olives, 2,080; walnuts, 1,444; pears, 637; other fruit, 1,649.

Citrus and Semi-Tropical.

The first California Almond Day will be on Friday, September 14, so fixed by the State Legislature.

The Wetherby Suburban Home Tract, which is planted out in olives 35 feet apart, began planting 600 acres of tepary beans May 10th.

L. D. Palmer, manager of the Orange County Fruit Exchange, says that the Valencia orange crop in the south end of Orange county will be 400 cars greater than last year.

Mr. Palmer believes that the exchange associations which have packing houses at Orange, Olive, Villa Park, McPherson, El Modena and Garden Grove will ship a total of 1,800 cars of oranges this year.

A new method of branding oranges, in which the branding is burned into the peel with an electric branding iron, has been put into effect at the College Heights Citrus Fruit Association packing house in Pomona. This scheme will be used in branding Sunkist oranges.

Due to the restriction of the importation of oranges in Great Britain and the war's influence on the markets of France and other European countries, there is a large supply of

Spanish Valencia oranges available for shipment to this country.

J. A. Fuller, whose orange grove is situated south of Porterville, dug up 200 orange trees in April, 1916, from the railroad right of way and reset them on his own land, and they are doing nicely, only two having died. This season he transplanted the same number of eight and 10-year old trees, and they all look well. Opinion among orange growers is divided whether transplanted trees will bear enough to be profitable.

The Exchange By-Products Company, organized about a year and a half ago by the California Fruit Growers' Exchange, in the first year of operation used almost 4,000,000 pounds of lemons in the manufacture of citric acid. The manufacture of citric acid has presented many obstacles which have been successfully overcome. Now that the problems of citric acid manufacture have been solved work is being done which it is hoped soon to make feasible the production of lemon flavoring, oil and tincture, for which there is ready demand.

Grapes.

The vineyards in Sutter county which were damaged by the frost are looking better. The output, however, will be cut about five per cent.

Plans for a mass meeting of grape growers May 26 to discuss the future of the industry in the State have been made by the directors of the California Grape Growers' Protective Association. Frank T. Swett is president of the association, and H. F. Stoll is secretary.

Miscellaneous.

Santa Maria will hold an agricultural fair October 24-27.

The Riverside county fair will this year be held October 9-13.

The State of California has 15 farms fully cropped this year.

The Fresno free market has brought in \$11,182.10 in revenue since December 17, 1912.

The prospects for bumper grain crops in Butte county continue. Deciduous fruits will be short.

Contracts for erecting a large addition to the Sperry mills offices in Stockton have been let.

May 13 is the date set for the dedication of the Woodward reservoir, located 25 miles southeast of Stockton.

The Lake County Canning Company will erect a warehouse adjoining the present cannery building in Ukiah.

Grass Valley mine managers have agreed to employ no men from the farms during the present stringency of agricultural labor.

Concerted efforts to knock out the Berkeley, Oakland and Piedmont ordinances against the keeping of chickens in private yards are to be inaugurated.

Special efforts will be made in Nevada this year to put Indian laborers in the hay fields to work. Indians are good farm laborers when liquor is put beyond their reach.

The bill validating the issuance of \$4,500,000 Los Angeles flood control bonds has been signed by Governor Stephens. This district includes a large portion of Los Angeles county.

La Panza ranch, which consists of 23,177 acres of fine grazing and farming land in San Luis Obispo county, has been sold to E. M., H. E. and S. H. Cowell and W. H. George of San Francisco for a consideration exceeding \$460,000.

Many acres of wheat are being sown in Nevada.

Kern county reports 38,000 acres planted to cereals.

An increase in the Missouri corn acreage of about 750,000 for this year is indicated.

Eight thousand acres of corn will be planted in the San Joaquin Delta this season, it is estimated.

Farm Adviser Amundsen of Placer county announces that he has disposed of the entire supply of Tepary beans.

Preliminary estimates show that Yolo county's rice acreage for 1917 will be better than 20,000 acres, or more than double that of 1916.

Seventy-five to 100 acres of tomatoes are to be planted around Lindsay, Porterville and Woodlake this season, the product to be canned at Lindsay.

More than 4,000 dryinids have been imported from Australasia by the State insectary to fight the beet leaf hopper in the beet fields near Salinas.

County Horticultural Commissioner Waite says that the aphids are increasing in numbers in the cantaloupe and barley fields in the Imperial Valley.

Alteration of the present fencing laws to make it incumbent upon stock owners to fence their animals in, instead of landowners being forced to fence other persons' stock out, has been voted by the State Assembly.

News comes from El Centro that the constructive measures embodied in the plans for the spending of \$2,500,000 along the line of the main irrigation canal has been endorsed by a majority of the property owners in the Imperial valley, and a bond election will be called.

Engineers have begun collecting data in connection with the proposed dam on Horse creek, with which to impound the flood waters of the Kaweah river section, the estimated cost of which has been placed at \$8,000,000. Irrigation of more than 500,000 acres of land will be possible.

A State law compelling vagrants and tramps to till the fields in the nationwide campaign to increase food production was unanimously advocated by Tulare county farmers and business men at a mass meeting held recently under direction of the committee on resources and food supply of the State Council of Defense.

A suggestion that all school openings next fall be postponed several weeks to permit girls and boys to work on farms and in food-producing establishments has been made to the House agricultural committee by Secretary Houston. He suggests a census be taken of all girl and boy students to help out in sections where farm labor is scarce.

Swine Notes.

The Oak Knoll farm shipped a carload of fat hogs to San Francisco last week, the first carload of Chester Whites from Napa valley.

E. Emerson of Mountain View has recently established a herd of registered Berkshires on his ranch in Contra Costa county.

Geo. Bruns of Livermore has quit Berkshires and will raise Chester Whites only. He recently received a bred sow from C. B. Cunningham of Mills.

H. E. Boudier of Big Ranch R, Napa, reports recent sales at follows: Five yearlings to H. Ackley, McCloud; two weanlings to C. E. Christley, Orland; one bred gilt to Ralph Groves, Kerman.

York and Son of Modesto report the sale of a registered Berkshire boar to Meadowview Farm, Merced. They have retained six head of choice sows as a foundation herd and expect to materially enlarge the herd.

R. Rodrick of Patterson has recently established a small herd of Berkshires on his alfalfa ranch, having purchased three gilts from the Oak Grove herd at Woodland. Two of the gilts are by Brinton's Longfellow and are likely looking prospects.

Gen. A. J. Gooch of San Francisco has recently purchased a registered Duroc boar and a bred gilt from John Daggs of Stanislaus county. He has also made purchases of Berkshires from Grapewild Farms and of Poland Chinas from A. M. Henry.

The Whitehall Estate Company now have a band of almost sixty Berkshire brood sows and gilts at their ranch near Tracy. Since selling their herds of Shorthorn and Hereford cattle they expect to give more attention to their Percheron horses and Berkshire hogs.

Manager Vandever of the New England-California Corporation advises us that he expects to reduce his herd of brood sows from 250 head to about 50, selecting only the best of his Duroc sows for the future foundation. They now have 1500 hogs on their ranch near Ripon.

Representatives of the California Swine Breeders' Association and the leading packers have agreed that 77 per cent shall be paid for at a premium of 10 cents per 100 pounds above the market price for every point they dress out above the basis per cent. There will be no cut in market prices for hogs dressing below 77 per cent.

The Deacon Ranch Company of Davis have sold their ranch and their entire Poland China herd. Four head went to A. R. Banta, Tracy, and the rest to Geo. E. Dierrsen, Sacramento. Mr. Deacon writes: "The advertisements in Pacific Rural Press brought a very satisfactory number of answers, for which we wish to extend our hearty thanks."

H. I. Marsh, Poland China breeder of Modesto, reports the sale of fifteen pure-bred Polands to Willison and Thompson of Mazatlan, Mexico; a service boar to Fred Hartsook of Lankershim, and a service boar to Miller and Lux. Since purchasing the eight top sows of the A. M. Henry herd, Mr. Marsh has twenty choice brood sows, one of the largest herds of choice Polands in the State.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

STACKS STRAW WITH NET AND ENGINE.

[Written for Pacific Rural Press.]

Straw stacking is usually a difficult and unsatisfactory job on account of the trouble of handling it at the stack with the ordinary hay fork and derrick.

On the J. S. Gibson Company's ranch at Williams, Colusa County, straw was stacked with little or no difficulty last fall by the use of a specially made straw net.

This net was made in two sections, the ends of both sections being strengthened by pieces of two by four placed crosswise of the net. The two sections were hinged together at the center, the hinges being securely fastened to the wooden cross-pieces. Five or six strong cables extend from the outside end pieces to an iron ring at which point they were securely fastened.

In use, the net is laid on the floor of the straw rack and the straw pitched directly from the field onto it. The looped ends are brought together when the netful has been loaded and another net filled. When the wagon is loaded it is driven to the stack where the looped ends are fastened to the derrick cable. By this means a large part of the load is lifted to the stack in one operation, the driver of the team using a jerk line to dump the net when it has been pushed to the proper location over the stack.

The accompanying picture shows a netful ready to be jerked, also the small gasoline engine which Mr. Gibson uses in stacking all of his hay and straw. It will be noticed that the straw stack is better formed than is usual when fork stacking is practiced, and a saving of considerable labor is also realized.

FAST CUTTER FOR VINE PRUNINGS.

To the Editor: Answering W. M., Fowler, in regard to cutting up grape prunings, we have invented a brush cutter that rakes and cuts the brush in the row as fast as the team will walk. It takes only one man to do the work. We expect to have this cutter on the market by next season.—Nord Bros., Kingsburg.

[The picture submitted with this letter shows a gasoline engine mounted on the rear of a heavy wagon frame on low wheels. The belt seems to run a wheel on a shaft across the wagon frame which runs a cutter close to the ground just in front of hay rake teeth between the wheels. The cutter has a heavy flywheel to carry it over heavy cuts.]

TRACTOR TO HAUL PRUNES.

[Written for Pacific Rural Press.]

For three years not a horse has been used in O. G. Wagers' 25-acre prune orchard in Sonoma County except one-half day. Everybody would like to disk the ground before plowing; but with horses, they usually can't get to it. Disking first, means plowing under a fine soil; while plowing first often means turning under a dry crust in clods that

the disk doesn't cut up later. This dries out the ground and prevents use of the plant food in it. Mr. Wagers uses a 6-12 tractor, with which he can do the work well and on time and can do much more cultivation than he could otherwise. He disks before plowing. Even the lug boxes are hauled into the orchard and the fruit out of it to the dip by tractor.

FORD ATTACHMENT AVOIDS STRAIN ON TRANSMISSION.

To the Editor: In your issue of April 7 you describe a Ford attachment that will fill silos, etc. We have been using the Ford to run an 11-inch silage cutter and blower. We always jacked up the hind wheels and ran belts from same to counter-

shaft, but I can easily see that the attachment you describe is the better way. Could you tell me if any firm or manufacturer has the attachment all ready to put on, or would one have to rig it up himself. The Mechanical Power Department of your paper is a great help to me.—W. Wilson, Modesto.

Several such attachments are made, one of which we have in mind costs \$48. We are referring your query to the manufacturers. As we remember, it, Mr. Anderson's attachment was at least partly home made. It avoids strain on the transmission such as you get by taking power from the hind wheel, because it takes its power directly from the crankshaft.

POWER NOTES.

A new free correspondence course in "electricity for rural use" is offered by the University of California at Berkeley to all California farmers. Two pumps of 5,000 gallons ca-

pacity per minute have been installed to irrigate 750 acres of beet fields owned by the Spreckels Sugar Co. in Monterey County.

A hundred 3½-ton motor trucks have been bought to move one big circus independently of the railroads. Each elephant will have his own palace car. Camels, etc., are to be carried in trailers.

In a letter received at this office R. L. Hill, field secretary of the National Duroc Jersey Record Association, states that he will spend a month or two in California previous to and after the State Fair this year.

Free weekly reports of condition of the 8600 miles of roads in the 20 National Forests in California is being furnished by the San Francisco office of the National Forest Service to hotels, auto clubs, press associations, newspapers and other interested organizations, which will make the information available to motorists.

PACIFIC RICE MILLS

24 BLUXOME STREET, SAN FRANCISCO

Successor to BUTTE COUNTY RICE MILLS
J. Frank Judge, Manager C. S. Morse, Sales Manager

February 8th, 1917

New York Belting and Packing Co.,
519 Mission Street,
San Francisco, Cal.

Gentlemen:

Attention Mr. R. B. Cameron

In regard to the belting for the Rice Flour plant, at the Bluxome Street mill, I will be ready to give you the order for Test Special belting about the 21st of this month. I have decided to use the Test Special and wire lacing on all belts except the motor drive, which you can have time to make endless.

From the results I have received from the Test Special in this plant, I do not believe I would be doing justice to the company in paying the difference for leather belts. The wire lacing is giving perfect satisfaction on our Hullers which is one of the worst tests I have ever used a belt.

The results I get from the Test Special and wire lace are very satisfactory.

Expecting to hear from you about the 20th, I remain

Yours truly,

J. S. Kennedy
W. J. Miller

Mr. Kennedy decided to use TEST SPECIAL after a most exacting trial. The belt that will give satisfactory service in a rice mill requires every quality of strength and tenacity to stand the very severe and constant strain.

—TEST SPECIAL will do your work as well.

CAMPING IN AUTOMOBILES.

[Written for Pacific Rural Press.]

Seeing California by automobile is luxurious now that we have so many fine paved roads. But hotel life is more expensive than gasoline, and a fellow on vacation hates to dress up all the time. W. T. Bailey of San Diego County is reported to have fixed up his car last fall so he could sleep in it on a long trip to the Oregon line and back, camping out for two months with his wife. They saw Yosemite Valley and Lake Tahoe, then up the coast road through the magnificent wilds of Humboldt County. This was not by any means all paved road, yet he reported getting 24 miles per gallon of gasoline, 800 miles per gallon of oil; and after 8,000 miles of traveling, he expected to get 12,000 miles more from the tires. This recalls one of our representatives, Chas. Barnum, who carried a girl from Mr. Bailey's home town as his wife; and camped out with her for many months in his automobile while he persuaded farmers that they need Pacific Rural Press.

HIRE YOUR TRACTOR.

"Help your neighbors" is the keynote of a special appeal to tractor owners issued by Assistant Secretary of Agriculture Carl Vrooman.

"Every farmer who owns a tractor," he says, "owes it to his country this spring to do all the custom or exchange work he can without neglecting his own work. Every hour that his tractor would otherwise be idle, it ought to be at work helping a neighbor who is behind with his work. Make your outfit work from dawn to dark; make it work all night if you have enough operators to fill the shifts. The acreage to be harvested this fall hangs on the plow. Don't let an acre that might otherwise be planted go untilled because your tractor is in the shed. Help your neighbors and thus do your part in strengthening the allied lines on the battle fronts of Europe."

THIS IS THE YEAR TO PULL STUMPS.

There is absolutely no doubt about that. Farm products are high, and are going to stay high for several years. There is big money in the land now.

Your stump land is the richest land you have. It doesn't need fertilizer. It is virgin soil. For ages it has been accumulating leaf mold and decaying vegetation of all kinds.

If you have stump land or woods put it to work. Every available acre means profits. No farmer today can actually afford to pay taxes on loafer stump land. This period of high prices demands the work of every bit of land you have.

There are a number of fine stump pullers on the market; and dynamite will often save a lot of hard pulling, even where it is used in connection with stump pullers.

A gasoline motor car is to be run on the Tidewater Southern to compete with auto stages. The car is to weigh nine tons and be 40 feet long—light weight for quick starting and stopping. A 90-horsepower motor is to run it up to 45 miles per hour.

CATERPILLAR

Reg. U.S. Pat. Off.

Lowest Cost Per Working Hour

Price, in the purchase of a tractor, should be a secondary consideration. Of chief importance are the tractor's dependability, its ability to do all sorts of work, under all sorts of conditions, with a low operating and upkeep expense.

Many years of Caterpillar operation have proved its cost lowest, not only per actual working hour, but also per acre worked. Statistics from hundreds of Caterpillar owners prove this to be so.

Power to pull an unusual number of plows at an unusual depth, versatility in operation, construction that minimizes delays and expense for repairs, make Caterpillar costs lowest, and Caterpillar profits largest.

We will gladly send you details on all models

Good Types of California Dairy Buildings

(Continued from first page.)

Floor plan of sanitary, convenient milk room. Store distillate fuel outside.

ing hot water or steam; and the space occupied by a small upright boiler is so small that it can be located near most any washing room without difficulty.

Electricity of ever increasing importance on dairies, both for light and power; and most builders in districts where electricity is available should plan on wiring both barn and

milk room, as well as outside corrals, for lights. Provision should also be made for running the separator with electricity, separator manufacturers having specially designed machines for this purpose.

LOCATION OF BUILDING.

In erecting dairy buildings some thought should be given as to the most desirable location. Generally they should be located so that the

prevailing winds blow from the residence toward the barn. The milk house should also be located on the windward side or end of the barn, as the trouble of foul odors is largely overcome thereby. In the plans shown, it will be more convenient to build the milk house at the end of the barn rather than at the side, in order to save labor.

Ground Grain and Chopped Hay for Cows

To the Editor: We would like to ask, in so far as you have the information, as to the economy of using ground feeds and chopped hay for cows. Do you have experiments showing the increased production due to ground grain or chopped hay? Have you found appreciable difference in the digestibility of alfalfa meal and alfalfa hay chopped fine or coarse?—R. E. H., San Francisco.

[Answered by Prof. F. W. Wolf, University Farm, Davis, California.]

The inquiry rather infers that there is a distinct economy in using ground grains and chopped hay, but according to our best information on the subject, this does not always hold true. Small hard seeds, like barley, wheat, rye, grain sorghums, etc., are utilized somewhat better by stock when ground or rolled than when fed whole. If fed to animals with poor teeth that cannot properly masticate their grain, it is also advisable to grind or crush Indian corn and oats, but even young animals whose teeth are well developed can masticate both corn and oats thoroughly, and the digestibility of these grains is not appreciably affected by grinding. This has been fully established through experiments with swine so far as Indian corn is concerned. The average digestion coefficients for shelled corn are: dry matter 87 per cent, protein 75 per cent, fat 64 per cent, fiber 44 per cent, and nitrogen-free extract 92 per cent, while the corresponding figures for ground corn are 87 per cent, 76 per cent, 64 per cent, 46

per cent and 93 per cent. The fact that barley is practically always either rolled or ground when fed to stock is a good evidence that this

feeding pigs and poultry and in the manufacture of mixed feeds. For dairy cows, beef cattle and sheep, however, the use of ground or chopped hay is justified probably solely on the score of saving storage room and avoiding waste in feeding.

An Efficient Grinder and Chopper Is a Great Time-Saver.

practice is of distinct advantage, however, and the same holds true with the other small grains mentioned.

It may be safely assumed that the advantages of grinding or chopping alfalfa come from the fact that such alfalfa can be fed without waste and requires less storage room than long hay. There is no definite evidence of improvement in digestibility or in feeding value per pound of alfalfa eaten, as a result of this preparation. Alfalfa meal or fine-chopped alfalfa has the advantage over long hay in being easily handled and mixed with grain feeds and is used largely in

The digestibility is not changed by grinding or otherwise preparing either hay or grain, because cattle as well as other farm stock are able to do their own grinding and have plenty of time to do it in, except perhaps in the case of horses working long hours. In eating long hay, this is thoroughly mixed with saliva which contains the first enzyme that acts on the nutrients in the feed in the process of digestion. If fine-ground meal or hay is fed, the feed is apt to be bolted quickly, and the digestion may be less complete in that case so far as some of the nutrients (the insoluble carbohydrates) are concerned.

TESTS OF BLUE-MILK COWS.

[Written for Pacific Rural Press by J. D. Williams of Bodega-Sonoma Cow Testing Association.]

Enclosed is a statement of tests, etc., from cows that gave blue milk. I told the cow tester to be careful and watch the cows that gave blue milk. I picked five that he marked as blue out of 75 we are milking, and I am giving you their test for four months.

The tester was telling me of a ranch where he was testing. The party would not put one of his cows in to be tested, as he said she was no good. He sent her milk to the house and when she was dry again he said he would sell her.

The cow tester asked the party to let him test her milk, as it would not cost him anything, so he did, and she tested 5.8. The cow is not for sale and the party is willing to put her in the herd and pay for testing her.

As regards increase of fat as a cow gets older, it will be very little, so far as I can see. Of course cows vary in test, as you will see by the enclosed statement:

Month	Name of Cow	Lbs. Milk	Test	Lbs. butter fat per day

PICKLED BUTTER.

To the Editor: Please tell us how to pickle butter and how long the butter will remain in good condition under favorable surroundings.—J. H. D., Irvington.

[Answered by S. L. Denning, University Farm, Davis.]

The practice of pickling butter is followed to some extent upon farms with fair results. The butter should be printed in the regular squares or rolls and then packed down in a wooden keg or stone jar. The jar or keg is then filled with salt solution in the proportion of 1 pound of salt to 4½ or 5 pounds of water. Put a weight on top of the butter to keep it below the surface of the brine. It is well to line the inside of the keg or jar with cloth before putting in the butter. A sugar sack can be used to good advantage for this purpose. The butter should then be kept in as cool a place as possible.

Just how long the butter will remain in a good condition will depend a great deal upon the condition of the cream from which the butter is made and the temperature of storage, but some very satisfactory results have been obtained.

The herd averages in the San Joaquin County Cow Testing Association are gradually climbing, due in part to the coming of better weather, and to better feed as well as an increased effort on the part of dairymen to secure greater production. The five leading herds for March averaged 30 pounds of butter fat, or one pound of butter fat per day per cow, or better. The average obtained by the leading herd is the highest that has so far been recorded in this association.

Remco Redwood

What a Remco Silo Means

1. That you are able to store your crop when feed is plentiful.
2. That you have green, succulent feed when range feed is scarce and grain high.
3. That you will get more and better milk.
4. That you will more than save the cost of the silo every year.

What a Remco Tank Means

1. That you can store water when wind power can be had FREE.
2. That a good supply of water is always on hand for home and farm use.
3. That you have reliable protection against fire.
4. That you will never have tank troubles.

What Remco Pipe Means

1. That you have an uninterrupted flow of water.
2. That your pipe will last longer than any concrete pipe or metal pipe except cast iron.
3. That your pipe will cost you less than any metal pipe.
4. That your pipe will stand heavy pressure either pumping or gravity and no standpipes are necessary.

REMCO SILOS, TANKS AND PIPE are made from CLEAR, AIR DRIED REDWOOD. They are manufactured by skilled mechanics using the most modern wood working machinery.

You can avail yourself of the experience and skill of our experts, who have made particular study of Pacific Coast needs. ALL INFORMATION IS GIVEN ABSOLUTELY FREE.

Experience with Milking Machines.

[Written for Pacific Rural Press.]

In order to get dairymen's actual experience with milking machines we have visited and written to a number of readers of the Pacific Rural Press, who have been using them, and we give herewith the gist of their replies. The machines used were Empire, Sharples, Calfway, and Hinman.

Shore Acres Dairy, San Leandro, have used milker continuously two and one-half years, milking on an average 180 cows, purebreds and grade. Careful tests have shown no change in milk flow or lactation period. Three operators drive in cows, do milking, strip after the machine, deliver milk to creamery and do barn feeding. Saving in labor amounts to one man for sixty cows. Attribute success to good operators and careful supervision. Rubberware is carefully watched and thoroughly cleansed to keep down bacterial count, which averages under one thousand.

Favor Bros., Gonzales, used milker about a year. Cows milked last year are now freshening and show absolutely no ill effects from machine. Had a little trouble breaking old cows to machine, but none with young ones. One man averages 20 cows per hour. Strip some of the

milkers. One man operates machine and milks in just half the time required by hand.

F. J. Austin has used machine 14 months on 30 cows. Can milk 20 cows per hour, against 18 by hand. Does not injure cows in any way.

Grapewild Farms, Escalon, used milker 3 years on 50 cows. Stripped every cow after machine. Two men milked 50 cows in one and one-half hours, while it required 3 men nearly 2 hours by hand. Quit using machine because feared cows would not keep up in milk as well as when hand milked.

P. V. Felts, Maxwell, has used machine 2 years. Finds it a great labor saver. Milks and strips 25 cows in half the time required for hand milking. Machines have not injured cows in any way.

Newman Bros., Elk Grove, used milker 18 months, milking 50 to 60 cows. Two men do work which required 4 men hand milking. Have found it important to have "man with brains" run the machines.

Orange Grove Farm, Campbell, have used milker 16 months, milking 15 cows. Do the work in three-fourths the time required by hand and find it pleasanter and easier, and get cleaner milk. Strip cows, secur-

THE EMPIRE ARMY "Mobilized" for Efficient Dairying

"America Prepared and America Efficient" means more than a fully equipped army and navy. It means industrial and agricultural preparedness of a high order—Modern labor saving methods in factory and farm.

The big army of EMPIRE users is prepared to "do its bit"—and more, regardless of the shortage of men that will result when recruiting begins in earnest. With

EMPIRE users will be able to produce more and better milk—milk more cows with less help—safeguard the quality of the milk by keeping it free from germs, flies and stable air—safeguard the condition of their valuable cows through the gentle, uniform action of the EMPIRE Teat Cup.

You, too, should be prepared with EMPIRE Equipment to meet the demands that will be made upon you for bigger and better production in this time of national stress.

See the EMPIRE dealer near you or write for catalog 45 and full particulars.

EMPIRE CREAM SEPARATOR COMPANY

Manufacturers also of EMPIRE Cream Separators—Gasoline Engines, and Farm Electric Plants

Bloomfield, New Jersey

Chicago—Denver—Portland, Ore., Montreal—Toronto—Winnipeg, Canada

The Milking Machine Gives All-Round Contentment.

cows. Saves the hire of one man. Thinks machine gets more milk than hand milkers.

J. H. Ellis, Maxwell, has had machine only short time, but has no trouble. Milks 22 cows in 47 minutes. Two heifers started on machine with caked udders were entirely well within a week. Is milking for neighbor a cow whose teat was cut on barb wire and cannot be milked by hand.

Edmond Wyndham, Redding, used milker 16 months on 28 to 35 cows. Milks 18 to 20 cows per hour. Machines milk clean, but he always trics teats when he takes cups off. Has never had a cow injured in any way by machine milking. Two members of family do work that required four milking by hand.

J. P. Casey, Half Moon Bay, installed machines, July, 1915. Cows took to it at once; not necessary to strip. Does not injure cows. Cows milked 1915 and 1916 now freshening with perfect udders. Machine enables him to keep more cows than if he milked by hand.

Rancho Buena Ventura, Cottonwood, used milker three months on 35 cows. Strip only very hardest

ing about one-half pound of milk from each. Unhesitatingly say that machine, if properly handled, cannot injure cows.

C. A. Bacon, Lockeford, using milker third season, finds it great saver of labor (at least one-half) and easier to keep milk clean. While machine will milk clean, finds it better and quicker to strip by hand. Cows stand better for machine than by hand. Machine has never gone on strike or quit job Saturday night. Has noticed no ill effects on cows.

Geo. V. Beckman, Lodi, used milker 4 years, milking 30 cows. Milks in half the time and with greater convenience than by hand. Has not injured cows.

Ten cows of the herd of N. H. Locke averaged 52.99 pounds fat for the month of March. The highest record was 76 pounds made by San Joaquin Lottie. Empress Lass finished her lactation period of 311 days with a record of 11,956.4 pounds milk, 637.1 pounds fat. This record was made under ordinary dairy conditions, milking twice a day, feeding pasture, alfalfa hay and silage and the cow carrying a calf.

Mr. Dairyman and Stock Feeder

We have some valuable information to impart to you regarding the feeds necessary for your stock. We are in a position to quote you reasonable prices on

thoroughly balanced dairy feed that is sure to save you money.

Protect yourself now while the products are available.

Yours truly,

LOS ANGELES

Breeding 10,000-Pound Grade Cows.

[Written for Pacific Rural Press.]

Purebred Holstein bulls and careful selection of cows by milk weighing and testing have made it possible for John Guill of Chico to get more milk from 22 cows than he previously did from 50 when he was using grade bulls. Mr. Guill's cow testing association record books show that during the testing year of 1916-17 his 22 grade Holsteins produced 223,746 pounds of milk and 7,614 pounds of fat, or an average of 10,170 pounds of milk and 346 pounds of butter fat per cow for the 12 months. This production has not been secured by any cross-cutting methods but by persistent effort to improve the herd since

1907 by the use of bulls of known ancestry and pure breeding. Before that time Durham blood predominated in the herd, which was an old one established by Mr. Guill's father in the early 80's.

A great deal of attention has been paid in late years to the dams of the bulls in service and some of the bulls used would undoubtedly have done good service in purebred herds, as their breeding was exceedingly good and their heifers have been heavy milkers. But even with such bulls Mr. Guill does not expect all of the heifers to be good cows. In fact, he figures that not more than 50 per cent are good enough to keep in his herd. This takes into account those that are poor producers, those that have defective udders, are shy breeders, or that are incapacitated in other ways. If a heifer is physically alright and produces 250 pounds of fat with her first calf Mr. Guill considers her good enough to retain, otherwise she is disposed of. She must also pass the tuberculin test; for Mr. Guill long ago began cleaning up his herd of disease and each year weeds out all reactors. By this method he has been successful in practically ridding his herd of disease, his percentage of reactors being lowered each year.

All heifers are grown by Mr. Guill to a milking age, being fed skim milk till they are about five months old together with alfalfa and wild pasture. They are bred when about 18 months old and reserved or discarded after freshening. Not only is this herd one of the heaviest producing herds of grades in the Sacramento Valley, but also one of the best in type, excelling in this respect most herds that the writer has seen in the State.

The milking barn of S. J. Smith in Stanislaus County is made cool in summer by an opening 2½ feet high along its sides back of the cows. This opening is closed in stormy weather by dropping a canvas rolled up on slender sticks.

Purebred beef bulls get stock which makes more beef from what little pasture or hay is available.

CREAMCUP HERD

Breeding animals of both sexes for sale at reasonable prices. A call at the ranch for selection is preferred to pedigree sales.

Real Holstein Quality

IF YOU ARE IN THE MARKET FOR A YOUNG BULL THAT WILL IMPROVE THE TYPE AND PRODUCTION OF YOUR HERD, LET US QUOTE YOU A SON OF ONE OF THE FOLLOWING PROVEN SIRE—

SEGIS PONTIAC DE KOL BURKE—Grand Champion State Fair 1916. His sire and dam both Grand Champions. His dam's record of 124.5 pounds milk a day average for thirty days is the second highest in the world. And best of all, he is transmitting this type and production. His daughters just coming in milk have produced as high as 23 pounds butter in seven days as two-year-olds.

KING MEAD OF RIVERSIDE—The sire of the present State record cow, Aaggie Acme of Riverside 2d, that has produced in 120 days' official test 529 pounds butter and 10,424 pounds milk. She is his first daughter tested at mature age. They average 4 per cent butter fat.

PRINCE GELSCHER WALKER—One of the best bred bulls in the world, and whose daughters have broken six or more State records as two- and three-year-olds.

A few of their sons from high-record dams now available at moderate prices.

Advantages and Construction of Silos

[Written for Pacific Rural Press.]

There is hardly a district in the State that does not now claim one or more silos; and their worth is so well evidenced by the past winter's experience that any clear thinking dairyman must be convinced of their merit by his own observation alone.

The silo has developed three functions for itself in California; converting all kinds of roughages into succulent form and preserving them indefinitely; providing satisfactory rotation crops to fit the irrigated farmers' demand for some summer feed crop that can be used in rotating with alfalfa, and furnishing a farm-grown foodstuff that makes a practicable if not theoretically correct supplement to alfalfa hay in the balancing of dairy rations.

The economic importance of silos is not confined solely to irrigated sections, for the early location of the silo in this State was along the coast districts where Indian corn could be grown in the summer months by dry farming methods and put into the silo in the fall. By this means the coast dairyman extends his seasonable supply of succulent feed several months beyond the strictly grass season, and in this manner extends the production period of his cows.

While the fundamental principle of all silos is the same, namely the storing of green feed in an air-tight structure, new types are being introduced each year, with the hope of improving the economical and air-tight-in-all-seasons features.

WOODEN SILOS.

Wood has unquestionably been far in the lead as a silage building material in this State. The three general types of wooden silos which have been put into most general use are the stave type, the resaw and studded type, and the octagon-shaped type.

Of the wooden silos, the stave types seem best fitted to most California conditions. It is true that the resaw and studded type leads all others numerically. This is not due to their superior efficiency, but to the cheapness of construction. Observation leads one to believe that any silo construction which calls for rigid nailing of boards together for the purpose of making an air-tight structure must ultimately fail to be efficient because of the tendency of all lumber to swell and contract in the wet and dry seasons of the year. It is for this reason that makers and users of the stave types lay claim to superiority, arguing that because of the elasticity of their patented extension hoops they can fit the silo to any climatic changes without danger of leakage. Less spoiled silage

is actually found in this type silo, after several seasons' use, than in the rigidly constructed types.

CONCRETE TYPES.

Concrete has been more talked about than used as a silo building material, although concrete has as a whole given general satisfaction on the California farm.

The solid, reinforced wall has been the type most generally accepted by silo builders; but through inexperience in concrete construction this type has often proved unsatisfactory because of cracked walls. This, however, is nothing to their discredit and can be entirely overcome by securing competent cement workers for their construction. Possibly the greatest drawback to the solid-concrete-wall silo in most locations is cost of construction, the average cost being two to four times that of the above mentioned wooden types. Sometimes where gravel is convenient, the cost can be materially reduced. The concrete block silo was introduced several years ago, but has not been promoted to any great extent in recent years. It is little if any cheaper than the solid concrete type and there seems to be more chance of faulty workmanship.

A new type of concrete silo has recently appeared on the market which incorporates the use of concrete staves, ten inches wide, two inches thick and two feet long, with tongue and groove on the sides. These staves are set in courses, the joints being bound with steel bands and the inside walls plastered. They are somewhat less expensive than the solid wall type and have the added advantage that the staves can be made where gravel is plentiful and hauled to the farm in the finished form.

BRICK AND METAL.

The brick silo has not been extensively used in the State although some promotion work has been done in this direction by brick manufacturers, and a few have been built in the past two seasons. They are less expensive than the solid concrete type and apparently just as serviceable.

The metal silos have not been extensively tried in the State, largely due perhaps to the almost prohibitive price of all metals during war times. The few that are in service are characterized as "entirely satisfactory."

A number of good beef steers were received last week by Los Angeles Killers from the McKittrick district in Kern county. Pasture there has been good and the cattle there in good condition and are being marketed quite freely.

MEAT SHORTAGE DESTINED TO BE SERIOUS.

It is doubtless true that it is "impossible to starve America" in the aggregate, but that there will be individual cases of suffering for lack of proper foods is quite probable. Meats are already selling at prices almost prohibitive to the poorer classes, and some form of meat diet is a necessity to physical and mental efficiency. Stock farmers are succumbing to the double temptation of high prices and feed shortage to get rid of their livestock, recking little of their own and the public's future requirements. Hay and mill feeds are selling at hitherto unheard-of prices, and the situation is becoming critical. California is now drawing on her northern neighbors, Oregon and Washington, for hay to supplement her own meager supplies. Farmers should therefore bear in mind that it is as imperative to grow crops for livestock as for direct human consumption. Nor can they be too often warned against parting with their breeding stock. Market your surplus only. Set your wits as well as your hands to work to feed your breeders. Don't kill the goose that lays the golden egg. You will help others by increasing your livestock output to the utmost, and in so helping others you will best help yourself.

AN AYRSHIRE BULL

Will. Peter Pan 21st, No. 16030

Will quickly breed into your herd. Highly desirable and profitable dairy qualities, viz.: Perfect type; health stamina; ability to subsist on short, rough or hilly pasture and produce profitably; supreme quality of product for either butter, cheese or whole milk, etc.

WE HAVE A FINE LOT OF YOUNG BULLS ranging from a few weeks old to yearlings. Several of them out of A. R. cows, or heifers whose dams are in the Advanced Registry. Fourteen head of our milking herd were selected from one of the largest and most prominent Ayrshire herds in the U. S. by H. H. Kildee of the Minnesota University, who judged the breed at the National Dairy Show at Springfield last fall.

OUR HERD BULL IS WILL. PETER PAN 21st, No. 16030, sired by Beuchan Peter Pan, Grand Champion Ayrshire bull of Scotland and America, and also Grand Champion at P. P. I. E., 1915.

WE HAVE SEVERAL CHOICE BULL CALVES Sired BY HIM.

Let us quote you on a desirable young male. Prices most reasonable and within range of any dairyman's pocket book. Correspondence invited.

SAVE YOUR CALVES

Raise Them Without Milk

Why throw away money by knocking them in the head or selling them for a dollar or two at birth when they can be raised or vealed WITHOUT MILK at a fraction of the cost of feeding milk. You profit both ways selling the milk and still have the calves.

The Best Milk Substitute to Use is

Ryde's Cream Calf Meal

the most successful milk substitute on the market—the standard of perfection. Thousands of farmers are using it and cannot say enough for it. It is NOT a stock food—it's a complete food that long experience has proved to be right for rearing calves. It contains all the nutrition of milk prepared in the most digestible form and is sold on a money back guarantee to give results.

100 lbs. equal to 100 gallons milk—Try it on your calves.

CARING FOR BLOATED CATTLE.

[Written for Pacific Rural Press.]

Pasturing green alfalfa has been a more general practice this spring than for years past because of the general scarcity of hay in the dairy districts; and as a result bloat has been a problem with many dairy-men.

When we visited J. W. Benoit, Holstein breeder of Modesto, early in April, he was pasturing a check of old alfalfa, but was taking great pains to prevent bloating by keeping the cattle well bunched, so that he could watch them closely. For this purpose he finds a well-trained collie dog almost indispensable and a great labor saver.

After pasturing the herd an hour to an hour and a half, he drives them back to the corral, taking particular pains to keep the water trough closed so that they cannot drink for several hours after they come from pasture. This is on the theory that they are already filled to the limit with gasey feed and that the water would only cause them to bloat easier.

When he finds a cow that is bloating, he takes her immediately to the barn, where he gets her on an inclined platform or bank, with head up. He then throws a couple of handfuls of baking soda in her mouth, which usually relieves the gas pressure at once. In case this fails to bring up the gas, he ties small sticks in their mouths, in bridle-like fashion, this acting as a gag. Sometimes he has put pepper on their tongues with good results, the effect being to get them to move their tongues and gag. When everything else fails, he uses the trocar, which enters the side of the cow at a point where the gas has accumulated.

MAKING BETTER ALFALFA HAY.

Much alfalfa hay is spoiled in the making. Here is the way L. L. Long of Stanislaus county cures and handles his hay so that it is always leafy when fed, regardless of the length of time it has been stored.

It is the usual practice on the Long ranch to cut 40 acres at a time, shocking right behind the mower, so that the minimum amount of moisture will be lost through evaporation.

As soon as the stems begin to dry out, it is hauled to the barn and put into the hay mow while the leaves are still rather moist. While storing, salt is sprinkled over the hay at the rate of about 200 pounds of salt to 100 tons of hay.

By this method the hay goes through a good sweat, the stems being dry enough to absorb any surplus moisture carried in the leaves and thus overcome possible spontaneous combustion. The salt and thorough curing makes the hay very palatable and there is scarcely any loss of leaves in feeding.

The Abelour Ranch Company delivered some polled Angus steers to the Newmarket Company of Los Angeles recently. These steers were mostly two years old and averaged a little over 1,100 pounds and sold for 9 cents weighed in Bishop, netting the owners within a few cents of \$100 apiece.

Always provide your hogs with plenty of clean water, and especially thirty minutes before each feeding.

CUTTER'S
BLACKLEG PILLS

"California's Favorite"
for nearly 20 years

For the Prevention of Blackleg
in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock.

Use any Injector, but Cutter's simplest and strongest.

Prices:

10 dose pkge. Single pills \$1.00
50 dose pkge. Single pills 4.00
10 dose pkge. Double Pills 1.50
50 dose pkge. Double Pills 6.00
Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

Real HOLSTEIN Quality
At Your Own Price

Our offering at the sale at Sacramento, Cal., May 31, 1917, consists of 10 highly bred females and 2 bulls.

One heifer whose first four dams average 34½ lbs. butter in 7 days, sire Spring Farm Pontiac Cornucopia, whose dam was the first 44 lb. cow, her dam a 31.70 lb. cow in our herd, who was sired by a brother to the twice 44 lb. cow Ormsby Jane Segis Aaggie.

A daughter of King Korndyke Sadie Vale, whose daughters are making such high records; her dam an own grand-daughter of Pontiac Korndyke, also De Kol 2nd Butter Boy 3d, both great transmitting sires.

A daughter of King Segis Pontiac, he being the best bred son of the great King Segis; her dam traces direct to Hengerveld De Kol and Pontiac Korndyke.

Seven other heifers equally well bred. Most of these heifers are bred to our herd sire, King Segis Alcartra Abbekerk, whose first eight dams average 30 lbs. butter in 7 days.

The two bulls offered are both fine individuals and highly bred. One whose first six dams average 28½ lbs. butter in 7 days, sire Prince Gelsche Walker.

One a show bull whose dam has a 28 lb. 3-year-old record, with a good prospect for a much larger record; son of a 36 lb. bull.

ALL CAREFULLY SELECTED FROM OUR HERD

This Form of Shed for Cows Saves Much Labor and Hay.

[Written for Pacific Rural Press by Jay Dutter, Galt.]

End View of Hay Feeding Shed Which Protects Cattle and Saves Hay and Labor. Boards Not Shown on One Half of End in Order to Show Inside Arrangement.

A great many visitors to the Henderson Company ranch to see the large herd of purebred Holsteins have desired to secure plans of a feeding barn which was planned and built by myself last fall, that gives a large amount of shelter to the stock, reduces the waste of hay, and also the cost of labor in feeding. The waste in hay is less than one-fourth what it formerly was.

The barn is really an addition to our 48 by 120-foot hay barn, but can be built as a unit. It consists of two wings extending at right angles to the main building on each side from the center, forming a cross and affording shelter at all times from the wind at three corners of the building. The corrals are so divided that four strings of cows are handled.

Any size barn like it may be built; it is meant, however, to feed cut hay,

although uncut hay may be fed; but we find it great economy to feed it cut.

The main supports of the building are 4 by 4 inch redwood posts set 10 feet apart, the outside posts being 7 feet high, and the two inside rows 14 feet high, and all of them bedded down in cement; the outside at the top is notched-in two inches, and a 2 by 6 nailed in to stay them lengthwise. To this, the rafters are nailed; each unit of our barn wings is 42 by 50 feet, giving shed room on each side of 16 feet. The center aisle is filled with cut hay to the roof, being cut and blown into a small door at the top and end of building.

Box mangers at the bottom have a feed rack just above, extending enough to be inside the edge of box manger. From there up to the roof is boarded tight, boards running lengthwise, thus forming a slope,

down which the hay slips into the rack when the barn is full, making a self feeder. Sometimes the hay has to be loosened, of course. The frame to which the rack is nailed is 2x4 every two in three, the third upright being 2x6 running from the top of the inside cement wall to the roof, forming a roof support as well as feed rack.

The end of the building is closed, and the sides open, giving an open shelter to the stock, a dry place to feed in during wet weather, and shade in summer. The shed holds 25 tons of cut hay, and will shelter 40 cows comfortably.

The accompanying sketch will help explain the building. I have never seen or heard of one like it. All who see it are greatly pleased with the way it works, and we are well satisfied with the great saving of hay and labor, as well as the shelter afforded.

Silage Corn Follows Oat Hay

[Written for Pacific Rural Press.]

The necessity of every livestock grower to raise a maximum tonnage of feed to the acre this year is more pronounced than ever before; and while it is now too late to entirely duplicate the experience of J. E. Bennett of Keyes, Stanislaus county, on his sub-irrigated land last year, it is suggestive of what may still be done by the use of silos.

In December, 1915, Mr. Bennett planted 14 acres of old alfalfa land to oats, using about 75 pounds to the acre, broadcasted. He harvested the oats for hay about the middle of June, securing 100 loads, which averaged 1,500 to 1,600 pounds per load, or almost five and a half tons to the acre.

Because of the advancing season, he irrigated as soon as possible and put several teams to plowing and harrowing, so that he was able to plant the ground to Indian corn, July 4 to 8, using a white dent variety, and dropping the seed about 16 inches apart in rows 40 inches apart. After planting, he cultivated four times to retain plenty of moisture and by the latter part of October the field was ready to cut for silage.

Mr. Bennett has two 70-ton silos of his own and he filled both of these to their capacity. Still having a surplus of corn, he filled a neighbor's silo of the same capacity to within ten feet of the top. He also sold a half acre of standing corn and used about two acres for pasture till the heavy frosts began.

Besides securing a higher yield of forage from his land than he would have secured from alfalfa, Mr. Bennett was enabled to feed as near a balanced ration all winter as one could wish for, using the oat hay, alfalfa hay, and silage, giving two feeds of each a day. As a result of the variety and quality of feeds, his herd of cows, half of which are heifers with their first calves, averaged a pound of butter fat during the entire winter.

CALVES ATE SPOILED HAY.

[Written for Pacific Rural Press.]

The chronic kicker was sore because in a year of exceptionally favorable weather there was no spoiled hay to feed the calves. J. L. Cramer of Tulare county is not such a kicker; but when rain last September kept ten acres of cocked-up alfalfa hay wet for two weeks, he foraged around for calves. He bought enough at \$10 per head, six to eight weeks old, to eat all of this, as well as a four-ton waste on a 77-ton stack of hay; and he thinks it paid him. The same system could be used for hay spoiled by rain in the spring. But watch the calves for digestive disturbances and remember that they will do better on good hay.

Alfalfa hay or clover hay kept in a rack where the brood sows can have free access to it during the winter months will not only cheapen the feed but help balance the ration.

It Pays to Salt Your Hay When Stacking or Baling

Cattle Eat Up Salty Forage Clean

(From Pacific Rural Press.)

"An ounce of salt a day in the rations is all right for cows," says G. L. Stearns, formerly of the Vina Ranch. This is probably not enough, so there ought to be some stock salt in the yards for cows to eat at pleasure. Sometimes in feeding cows for official test, as much as 3 ounces per day is mixed in the feed. This makes the cows thirsty and they drink more water and produce more milk. But it is necessary to be very careful in feeding salt in the rations, for it is apt to give them the scours and is also likely to cloy their appetite so that they will not eat enough to make a record yield of milk.

Two crops of fodder per year, which the stock eat up clean, are grown by a settler on the Natomas Consolidated project in Sacramento county. He grows purebred Duroc hogs and Shetland ponies, and claims that his oat hay cut early in May yields 3½ tons per acre. Immediately after it is cut, corn is planted; and if this doesn't mature it is cut as fodder when the kernels have dent. The ears are taken off and the stalks stacked in the yard with a large amount of salt which induces the stock to eat it more completely than otherwise. His neighbor, Mr. Jensen, salts his threshed wheat straw, which the cattle eat clean. Leading dairymen use salted alfalfa hay the year round for feeding dairy cows to increase the flow of milk.

Thirty Years of Good Bulls and Testing.

[Written for Pacific Rural Press.]

The stories of all high-producing herds of dairy cows differ so little in the main that one can almost forecast with exactness the answers that will be brought out from his questioning of the fortunate owners.

Always we are told, "I used purebred bulls, weeded out the poor cows by the use of scales and tester, and saved the heifers from the best cows."

And that is the essence of the story of J. D. Williams' herd of grade Jerseys in Sonoma county, one of the oldest and highest producing herds in the locality.

It was about thirty years ago that Mr. Williams began grading up his herd of Durham cows with purebred Jersey bulls. At that time the Babcock test was unheard of, the cream

gauge being depended upon instead. While this and the lactometer test were only approximately correct, they furnished a somewhat definite method of ascertaining the good and bad cows.

After the invention of the Babcock test, Mr. Williams weighed the milk from individual cows and secured tests more or less regularly from the creamery of which he was director and manager, maintaining as far back as 1895 that a cow which couldn't produce 225 pounds of fat in a year wasn't good enough for him to keep in his herd.

Having an idea of the relative value of his cows, it was not difficult to distinguish between the heifers that were to be saved and those that were to be disposed of, as only those from the best cows were considered apt prospects for the milking herd. But the mere fact that a heifer was from a high-producing cow did not keep her in the herd unless she was also capable of producing. The standard set for such heifers is a pound of fat a day during the ten-month lactation period.

But Mr. Williams does not credit all the good in his heifers to their breeding alone. He believes the way they are handled after they freshen with their first calf has a lot to do with their future usefulness.

Most of his heifers freshen during the fall or winter months; and by the first of July are pretty well along in their lactation period. As feed about that time of the year is usually pretty scarce in the district, it is quite a common practice of other dairymen to dry up the heifers with first calf at that time. But not so Mr. Williams. He believes that the time to make a cow out of a heifer is right at that time; that if fed and milked she can be made a persistent milker in future years; but that if she is starved and dried up she will always be a short time producer.

Operating on this theory, he begins feeding cheap mill feeds to all of his heifers about that time, continuing the practice as long as they will pay their feed bill.

The fact that he is in a hill dairy section does not deter him from year-round milking, the practice being to feed mill feeds, hay, and thousand-headed kale in seasons of dry pastures. Not only does this additional production more than offset the feed cost, but it materially increases the production of the cows when the grass season begins, as they are in good physical condition to make the best possible use of the succulent feed.

A. B. Humphrey of Grapewild Farms reports the sale of a Berkshire boar and sow to L. K. Smith and H. W. Rice of Hawaii; the boar, Fashion Longfellow 30th, to Miller & Lux; a boar and sow to Loma Rica Ranch, Grass Valley; a granddaughter of Grand Leader 2nd to Arlington Smith of Visalia; a boar to Mr. McDermott, Maxwell; six boars to H. L. Bates, Holt; a bred gilt to D. N. Gilmore, Stockton; a boar to A. A. McCoy of Dixon; and a Grand Leader 2nd boar to Homer Hewins of Calistoga.

Pure-bred hogs sell well. The Whitten hog ranch in Tulare county has sold the last of 800 hogs that brought \$35,000.

Dependable Stock Remedies and Foods

Strong, healthy stock is PROFITABLE stock. Increase your profits by freeing your cows, calves, hogs and horses from sickness and disease.

Use "Kew-Kure" for abortion, barrenness, bloody milk, colds, cow-pox, diarrhea, milk fever, tuberculosis, etc.

"Bag Balm"—a soothing, healing, penetrating ointment that produces immediate relief.

"Blatchford's Calf Meal" will raise your calves without milk—at about one-third the price of milk.

We also recommend Conkey's and the International foods, and worm remedies, and Pratt's Animal Regulator—for cows, hogs and horses. Send for free literature.

Purebred Registered HOLSTEIN CATTLE

The broad highway to success is persistent and intelligent application to something worth while. A successful 60-year-old dairyman said, "I have made the greater part of my money since I was forty-five. Up to that time I was making mistakes. I corrected a host of mistakes and ideas about cows and have made nearly all the money I have since that time." The difficulty is that some dairymen never wake up. Any farmer who will devote a short time to a study of the supremacy of Holstein-Friesian cattle as profitable milk producers and as dual purpose cattle will be able to turn his dairy operations to a profitable basis. Send for free literature. There's big money in the big "Black and White" Holsteins. Send for FREE Illustrated Descriptive Booklets. The Holstein-Friesian Association of America F. L. Houghton, Sec'y, Box 230 Brattleboro, Vt.

PATRIOTISM DEMANDS

That All Butter-Fat Waste Be Stopped

President Wilson's powerful appeal for the conservation of the nation's resources is still ringing in our ears. "The supreme need," he says, "of our own nation, and of the nations with which we are co-operating, is an abundance of supplies, and especially of food-stuffs"; and again, "Upon the farmers of this country, therefore, in large measure rests the fate of the war and the fate of the nation."

Wasteful methods must be abolished. Every device that makes for the saving of time and labor on the farm must be utilized. Every plan that makes for the conservation of our food products must have the farmer's hearty co-operation.

And nowhere is there greater opportunity than in the production of dairy products, particularly butter-fat.

"Fats, fats, fats, more fats," that is the demand of the warring nations in Europe. The men who toil and the men in the trenches must have fats. They are the fuel that the human machine must have.

And no fat is so palatable or so easily assimilated as butter.

When it was simply a question of the farmer's own loss of profit, the tremendous waste of butter-fat on American farms was bad enough, but under present conditions such waste is nothing short of criminal.

And it is wholly unnecessary.

It is conservatively estimated that about a million cow owners in the United States are still skimming milk by some wasteful "gravity" method.

At an average of four cows to the farm, and an average waste of thirty-five to fifty pounds of butter-fat per cow, all of which could be saved by the use of a De Laval Cream Separator, this alone represents an annual waste of at least 140,000,000 pounds of butter-fat.

Then there are, perhaps, a million inferior or half-worn-out separators in use whose owners could save fifteen to twenty pounds of butter-fat per cow per year by replacing such machines with New De Laval's; and this represents another waste of at least 60,000,000 pounds of butter-fat annually.

Also there is the loss of time and labor that a De Laval would save and which could be better devoted to other productive work on the farm. This waste is hard to compute, but it is almost as important as the loss of butter-fat.

These are startling statements, but any dairy or creamery authority will agree that these estimates of waste are really very conservative.

Shall this tremendous waste continue? Will the loyal American farmer permit such waste when he appreciates the duty that is laid upon him to conserve the one article of food that above all others is necessary to the life and health and energy of the men who serve the nation in the field, the factory, the mine—and soon in the trenches?

We have always had an abiding faith in the American farmer, and we believe that if he is made to appreciate the full purport of the President's appeal to him, the appeal will not be in vain; and when he further appreciates what the De Laval can do to save the butter-fat which is now being wasted, and that his patriotic duty demands that such waste be stopped—NOW—our plants will not be big enough to take care of one-half the demand for De Laval Cream Separators.

Silo Crops and Planting

[Written for Pacific Rural Press.]

The silage possibilities of field-grown crops in this State are not confined to any one crop or group of crops; and as silo experience advances, the list of possible silage crops enlarges.

Corn has always maintained a lead in popularity through the eastern sections of the country because its culture is general for grain and it makes a palatable and nutritious silage. This prestige has led most Californians to depend upon Indian corn as the main silo crop, supplementing it in the early summer with spring-grown crops such as alfalfa, green oats, barley, vetch, and in some few instances wheat.

Like most other crops, the culture of Indian corn varies so widely in different parts of the State that hard and fast rules cannot be set as to planting and care. In a general way the corn growing land can be divided into two classes, the higher lands where moisture must be retained by cultivation alone and the irrigated areas where moisture either through sub-irrigation or direct watering may be relied upon for maturing the crop.

On the dry farmed areas, early plowing and preparation of the land is essential, and frequent cultivations should follow planting as long as practicable. The yield on such land averages about six or seven tons of green feed per acre.

More latitude is allowed the intending corn planter on irrigated land; in fact most of the corn planted on such land follows a previous crop of oats or barley; and in some instances one or two crops of alfalfa may be secured from an old field before corn planting time.

The usual practice is to harvest the oats and barley, either as hay or grain, the latter method being more risky because of the delay in

planting the corn. In normal seasons corn can be planted as late as July, after the hay or grain has been removed and the land irrigated, plowed, and worked down in the interior irrigated sections and still have time to mature sufficiently for silage before the early fall frosts; but it is safer to plant before that date if possible.

SORGHUMS SATISFACTORY.

While poor success has sometimes resulted from the siloing of the sorghums, as compared to Indian corn, it seems evident that it was the methods used in siloing them rather than the material which was responsible. Many silo owners depend entirely upon the sorghums for their silage crop and report satisfactory results. As they are surer yielders in many locations, their more general use cannot be too strongly recommended.

The chief concern of the silo owner who is using sorghum for silage should be to see that it is not harvested too green, preferring to allow the leaves to dry to a considerable extent as the stalk carries more juice than Indian corn and provides sufficient moisture for the fermenting process in itself. By handling in this manner, the silage is not so apt to be sour and distasteful to the cattle.

The culture of the sorghums for silage is nowise different than when grown for grain; and it fits itself to a double cropping system similar to that outlined for Indian corn on the irrigated areas. Earlier planting and cultivation is naturally required on dry farmed land.

The varieties of sorghums, as well as of Indian corn should be selected with an idea of forage they will produce as well as of grain, it being im-

portant that a tall, leafy-stalked variety be planted if the maximum yield of silage is the chief consideration.

While it is not generally considered in the sorghum class, Sudan grass, a sorghum in reality, seems to fit itself to silage making purposes, providing a good pasture early in the summer and maturing before fall frosts, a heavy crop of forage good for silage.

While its feeding value is still little known, it seems probable that it will prove satisfactory, as the stems carry considerable grain when matured.

LEGUME SILAGE.

The price of cured hay will probably greatly lessen the amount of first cutting alfalfa siloed this year; although in other years many silo owners have used the silo advantageously in caring for this first cutting, which was either badly infested with foxtail and other weeds or which could not be cured because of late spring rains. As a whole, such satisfactory results have not been secured with alfalfa silage as with corn or sorghum because of a rather

rank odor and unappetizing flavor characteristic of legume silages. For that reason it is probable that alfalfa will be used very little for silage.

Vetches have not been used to any extent separately as a silage crop, but have been successfully used with barley, wheat, and oats when planted in the winter and siloed during the early summer months.

Pea vines have been siloed successfully in sections where large acreages of peas are grown for the canneries; and with the increased acreage planted to that crop this year, some silo owners are planning to use this by-product for silage instead of using land for silage crops that can be profitably farmed otherwise.

Never have the advantages of the silo been so well demonstrated as during the past winter because of the scarcity of other feeding stuffs; and while it requires some courage to plant land to silage crops that might otherwise produce high-priced cereals and beans, the silo's place on the farm is too well established to permit its neglect at this season of the year.

ACTUAL EXPERIENCE WITH "CALF-WAY" MILKERS

In order to secure material for an article on milking machines in California the Pacific Rural Press wrote to a half dozen users of Calf-way Milkers for the result of their experience. Here is a specimen reply:

HALF MOON BAY, April 16-17.

Pacific Rural Press, San Francisco, Cal.

In July, 1915, I installed a "Calf-way" Milker. I had no trouble at the start-off, the cows took to it kindly. My herd consists of twenty cows and it takes four to six minutes per cow to milk them.

It is not necessary for me to strip the cows after machine, although I try all of them after removing teat cups. It milks the average cow as clean as hand milking. It is a labor saver, more so in large herd. It can be seen that with the adding of more units (uses one double unit) I could milk forty cows in the same time it takes me to milk twenty. I am able to keep more cows than I could if I had to milk them by hand. The machine does not injure the cows in any way whatever. I was told when I installed machine, that it would dry the cows up. I have proved to my satisfaction, that it does not. The cows that I milked with machine in 1915 and 1916, have all freshened now with perfect quarters.

J. P. CASEY.

Equally favorable replies were received from the other five: F. J. Austin, Delevan; Favor Bros., Gonzales; Wyndham Dairy, Redding; J. H. Ellis, Maxwell, and Rancho Buena Ventura, Cottonwood. See article entitled "Milking Machine Experience," in this issue.

We have received many such letters and one from Professor F. W. Woll, in which he states that a Jersey in the University herd milked with a Calf-way milker during last lactation period produced 9052 pounds milk and 587.95 pounds butter fat. His letter concludes as follows: "The fear among some breeders of dairy cattle that it is not safe to use milking machines on purebred cows is gradually being dispelled. Experience has shown that a careful man operating a milking machine may be safely trusted to get all the milk that is in the udder and to secure a maximum production from the cows during the lactation period." The production of Interested Japs Santa, given above, is another evidence of this fact.

If with the present high price of labor you would be interested in a "Calf-way" Milker, send us the number of cows you are milking, with a rough sketch of your barn, and let us figure with you.

CALF-WAY MILKER CO.

First and Market Sts., S. F.

Turns Easy— and as slow as you wish

"The Weight of
the Crank
Starts
It!"

—for the Sharples skims perfectly clean, regardless of whether you turn fast or slow. So, when tired, simply turn slower—you can't lose cream for the wonderful Suction-feed drinks up the milk only as fast as it can be perfectly separated.

The Sharples Separator runs very lightly at any speed, for the bowl hangs from a single frictionless ball bearing, running in a constant bath of oil, same as the enclosed gears. Again the Sharples Tubular bowl is remarkably light, since it contains no discs whatever. The normal speed of the Sharples is only 45 revolutions per minute—most other separators must be run at 55 to 60 turns per minute, or they lose cream to the amount of 7 to 13 lbs. per cow per year on the average farm. If you drop considerably below 45 revolutions with a Sharples, you will still skim perfectly clean, and get all the cream possible.

SHARPLES SUCTION-FEED CREAM SEPARATOR

Easy to Wash. The Sharples has no discs to be washed—just a simple tubular bowl with one small piece in it. This tubular bowl is broadly patented. A brush cleanses it quickly and it can be put together almost instantly. Its long, narrow shape creates double the skimming force over the disc-filled bowls found in other separators. Sharples is

- the only separator that skims clean at widely varying speeds
- the only separator that skims faster when you turn more quickly
- the only separator that delivers cream of unchanging thickness—all speeds
- the only separator with just one piece in the bowl—no discs, easiest to clean
- the only separator with knee-low supply tank and a once-a-month oiling system

FLBERT HUBBARD said: "Don't take yourself too damn seriously." Now that's what we call mighty good advice and we try to keep it in mind at all times. Nevertheless, when we look over its splendid record and view the excellent work it is doing, we cannot help being just a bit proud that we are manufacturers of the INDIANA SILO for the Pacific Coast.

The INDIANA SILO has an absolutely clean record behind it, a record established during the past fifteen years by its efficient use on over SIXTY THOUSAND American farms. If you could visit our own big factory, or any one of the five big plants of the Indiana Silo Company, you would easily understand why this record is so good. Back of the Indiana Silo's construction plan lies fifteen years of practical experience in the building of silos exclusively, and in it is used that greatest of all combinations of silo materials—cold-rolled, mild steel hoops, malleable lugs and small parts, and clear, kiln-dried Oregon fir staves. New, mild steel, evenly threaded in our own plant, insures hoops of more than sufficient strength to meet all requirements, and malleable small parts are the best of insurance against broken parts. Oregon fir—clean, clear, straight grained and thoroughly kiln-dried—gives a stave of exceptional strength, great durability and a minimum of shrinkage. Oregon fir is not effected by the silage acids and, if painted on the outside, will last a lifetime. Being exceptionally strong, it will withstand the elements remarkably well. Indiana Fir Silos, if erected according to instructions, do not get out of shape or blow down.

The INDIANA SILO embodies efficiency, economy, durability, strength, convenience and simplicity. Its simple, convenient construction enables us to build it at a cost within the reach of every farmer, yet it includes every essential necessary to satisfactory service and long life. No requirement is omitted, no unnecessary expense added. Everything the best—no extravagance—nothing unnecessary—the least investment—the greatest earning power; these ideas of efficiency are constantly before us. Our faith in the INDIANA SILO is shown by our absolute guarantee, backed by millions of dollars resources. Ask your banker.

Indiana Silos have not advanced in price as yet, for we contracted for our steel supplies last year and our own big mills manufacture our lumber. Nevertheless, our business has trebled this year so far and we may find it necessary to draw on our 1918 supply of steel before the season is over. So our advice is—BUY EARLY. It costs you nothing, protects you against price advances and insures having your silo just when you want it. Won't you let us tell you what size silo you would find most satisfactory, what it will cost you and how much feed it will save? Thank you.

Inexpensive Labor-Saving Dairy Ranch.

One of the most labor-saving and sanitary, yet inexpensive dairy outfits we have seen is that of Geo. H. Ennis and E. L. Williamson in Riverside county, where four strings of grade Holsteins headed by purebred high-record sires produce about fifteen cans per milking, the year through, averaging nearly a pound per day of butter fat through the lactation periods.

The Ennis-Williamson ranch contains about 150 acres, including 100 acres of alfalfa. It seemed necessary when acquired three years ago to get dairy cows to market the alfalfa; and dairy cows would also furnish fertilizer for Ennis brothers' 400-acre citrus orchard not far away.

FEEDS GIVEN IN YARDS AND STABLE.

The cattle are not pastured, but fed hay and green feeds in corrals, and other feeds in the cement-floored, corrugated-iron roofed stable which shelters all of the cows at once during milking.

Year-around succulence is furnished. Last year a 20-acre piece of Indian corn filled a 166-ton wooden silo; and 15 acres more filled another three-quarters full. Seventy-five tons extra cost \$225. The 15 acres were planted, after the corn was off, to barley, which was expected to be heading out early in March when the silage was gone. This was to be mowed and fed green until alfalfa could be fed green in the yards. Green alfalfa would last until the 40 acres of corn to be planted this year could be cut for green feed, and later could be fed as silage again.

In the cement manger of the milking barn, two feeds per day are put in to be eaten during milking. The usual ration per day is the equivalent of 300 pounds silage, 200 pounds beet pulp, and 50 pounds cottonseed meal per string of 30 cows, besides the hay or soiling crops fed in the yard. The silage is hauled on a straight track by car from twin silos to barn.

SLAT RACK SAVES HAY.

When Supt. McCord came to the ranch, the cows in the yard were eating hay "through the fence." When a "boss cow" bunted another while feeding, the other would run off with a bunch of hay, stringing it over the corral. Mr. McCord built V-shaped slatted racks with board manglers under them to catch loose wisps; and he found it a big saving. This was appreciated last winter when the cows had to be put on short rations of 10 pounds per day of high-priced hay.

Two sheds in each corral were made of corrugated iron roofs on rough poles. They face each other so that when their roofs are extended to meet, they will shelter about 44 by 44 feet of ground. This is for the 30 cows kept in each corral, which is about 100 by 150 feet and connected by its own lane to the milking barn. The ground is sandy, but will be better drained by trenches filled with cobblestones. Salt is kept in corner boxes in each corral. An alleyway is provided solely for breeding purposes and a separate corral for a hospital.

MANURE DISPOSAL.

The milking barn has concrete floor, sloping 10 inches in its 100-foot length. The gutters are 16 inches wide and uniformly three inches deep. After solid manure has been hauled by litter-carrier to the

spreader at a distance from the barn, the floor is hosed down from faucets located every 20 feet along the walls. All gutters drain into a concrete septic tank of three compartments. Several hundred gallons per day of stable washings run into this tank and come out as a clear liquid which fertilizes the alfalfa. The solid manure is spread on corn ground.

MILK HANDLED EASILY.

Water pressure is supplied from a tank house near the barn, high up and filled by engine power. In the lower rooms of the tank house are the separator and cooling apparatus. Cans of milk are carried to a platform high enough to pour through a cheesecloth strainer, whence it runs into the milk room over a cooler which cools the milk to 50 degrees, winter or summer. A steam boiler heated by an oil burner furnishes

steam to sterilize utensils. An auto truck hauls the milk to Los Angeles every day for 20 cents per can.

About 50 gallons per day were being separated and fed to calves, whose management makes another story, except that all grade bull calves are cut at three months old, and that 80 surplus heifers were being kept on the orange ranch in February to supply fertilizer conveniently.

THEY KNOW THEIR COWS.

All milking stock has been tested since two years ago last November, even though the Cow Testing Association fell through. Card indexes show at a glance the milk records, blood lines, tuberculin-test records, ages, breeding dates, bull to which each is bred, etc. Mr. McCord carries a field notebook where the daily events are noted and transferred to the cards in a short time each evening. Use of the cards keeps each cow's history all together. The milk records are on separate cards. The cows and calves are identified by metal tags inserted low down in their ears before they are weaned.

"We try to stick to the maxim, 'No cow can linger here that gives less than 300 pounds a year' of fat," says Mr. Ennis. A number of them

produce over 400 pounds; and one, 510 pounds. Mr. McCord and the milkers pointed out one cow that tested 6.8; another that tested 6 per cent; another that gives 10 gallons per day when fresh. Many of them are purebreds not registered.

A magnificent six-year bull, Rowena Maid Mutual, heads the herd, while Prince Gelsche Walker VIII, a three-year-old, is putting spectacular records behind the offspring of 20 heifers bred to him. The Rowena bull weighed well over 2,500 pounds in breeding condition, has a great heart girth, and his pin bones are almost as high and as far apart as his hip bones.

A. Gregory, owner of the Marigold farm, comprising 1,000 acres within two miles of Redlands, reports that at the present time he is milking 125 cows and producing 300 gallons of milk a day. His cattle consists of Holsteins, Guernseys and Jerseys. He expects, however, to start a herd of purebred Holsteins in the near future. He has 400 acres in alfalfa and is well fixed to enter the breeding business in a large and successful way.

The J. S. Gibson Company used milo maize in their silos this year, but found it too rich for the dairy cows. All the cows conditioned on it failed to make records equal to their former seven days' records. They will feed milo green after this.

A GREAT HOLSTEIN EVENT

COMPLETE DISPERSAL OF THE STANFORD HERD.

AUCTION at Vina, Cal.

(near Chico)

June 5, 6, and 7

9 a. m. Each Day

By order of the Board of Trustees of Leland Stanford Jr. University, the unequaled herd of 300 registered purebred Holstein-Friesians on the Stanford Ranch at Vina, California, will be sold to the highest bidder, June 5, 6 and 7.

One of the Many Great Individuals

AT EACH DROP OF THE HAMMER SOMEBODY'S HERD WILL BE IMPROVED.

Intelligent breeding, by the infusion of grandest blood strains, has developed this herd, established by the late Governor Stanford in the early 80's, until it is without a peer.

This sale offers unexcelled opportunities to secure cows of wonderful capacity and bulls of character. All tuberculin tested and free from abortion. Just study these offerings:

40 GRANDDAUGHTERS OF KING OF THE PONTIACS.

The only bull with two 40-pound daughters and the only bull with a 40-pound daughter and a 40-pound granddaughter. He also has a 41-pound 3½-year-old granddaughter.

40 GRANDDAUGHTERS OF COLANTHA JOHANNA LAD.

Another wonderful sire with two daughters that made over 750 pounds of milk in 7 days; 30 of them averaged over 600 pounds of milk in 7 days; 8 of them made records of from 30 to 34 pounds of butter in 7 days.

20 GRANDDAUGHTERS OF SEGIS PONTIAC DE KOL BURKE.

Leading sire of the Morris herd and one of the best bred bulls in the world. He was senior and grand champion at the California State Fair in 1916.

40 A. R. O. COWS AND MANY OTHERS THAT WILL DO AS WELL OR BETTER ARE TO BE SOLD FROM THIS HERD THAT HAS NOT BEEN DEPLETED BY SALES. THIS STOCK HAS THE GREAT GROWTH POSSIBLE ONLY ON THE PACIFIC COAST AND IS ACCLIMATED. WHY GO EAST FOR UNCERTAINTIES?

Advanced Breeders, Dairymen, Beginners: The blood of these black and white aristocrats is almost invaluable. Can you afford to miss this sale?

300 IN ALL AND INCLUDING MANY SHOW ANIMALS. STANDING OF INDIVIDUALS IN THE HERD ENTERED IN STATE COW COMPETITION WILL NOT BE AFFECTED BY CHANGE OF OWNERSHIP.

BUYS COWS AND BULLS BY TEST

[Written for Pacific Rural Press.]

It is very seldom that a better example can be found of the benefits which result from using the Babcock tester and scales and the use of herd sires out of high producing cows than on the H. H. Wallis dairy on the west side of Stanislaus county.

Mr. Wallis began dairying eleven years ago. Among the first things he bought was a pair of scales and a Babcock tester. In buying his foundation herd he purchased twice the number he expected to milk on the theory that he would have to do a lot of weeding out. In this he was not disappointed, for inside of two weeks he had culled out half of them as undesirable and in six months he had another third cut out. Since his first purchases he has also insisted upon weighing and testing the milk of each cow for a couple of weeks before buying. He has paid as high as \$100 a head for his pick of a herd, when the average price for cows was but \$65. At that, he considers that he has made money by buying the high-priced cows; for they pay a good profit, while many times the cheaper ones would only pay for their feed and sometimes not even do that.

In buying cows in this manner he insists upon a four per cent butterfat test and does not consider a cow an extra good one unless she produces 40 pounds of milk per day under ordinary dairy conditions, when reasonably fresh. He figures that first-calf heifers of his own breeding should make 400 pounds of fat the first year and with this kind of stock he is able to develop aged cows that produce as much as 600 pounds of fat a year.

While Mr. Wallis attributes a great deal of the credit for this production to his scales and tester, believing that they are just as necessary as the milk pail on every dairy, he also appreciates the value of purchasing bulls out of high testing dams for use on his cows.

With the exception of one of his herd sires which was out of a three-teated cow and whose record was lowered on that account he has always had bulls out of cows that produced 32 pounds of butter or better in seven days, all of them being registered Holsteins.

But high weekly production is not the only factor which Mr. Wallis considers when buying purebred bulls for use on grade cows; for it has been his experience that the butterfat test of a bull's progeny is almost certain to decrease in percentage when the bull's dam is a low tester and almost sure to be increased if the bull's dam is a high tester. As he is a firm believer in higher testing Holsteins, he always demands bulls with high testing ancestors; and in this way he has gradually increased his test to its present high level.

Except in cases where cows are abnormal producers, Mr. Wallis has never fed anything but alfalfa hay, supplementing it in some few cases with dried beet pulp so his high average yields are directly attributable to his weeding out and breeding practices.

Included in the consignment of the Bridgeford Company to the California Holstein breeders' sale is a 2-year-old heifer, Spring Farm Cornucopia Ormsby, whose four nearest dams have records averaging 34½ pounds.

MAXIMUM CROPPING OF FORAGE CROPS.

Securing spring pasture, a crop of barley and a crop of silage from the same land in one year is what E. E. Freeman of Modesto has done on his 40-acre ranch the past two seasons.

He plants his barley in the winter, on sub-irrigated, sandy soil, and in 1916 was able to pasture it for five weeks before quitting to allow it to grow for hay. This year he only pastured about a week on account of the backward weather. Last year he harvested a 30-sack crop of barley from the land before planting to corn.

When he began harvesting the corn for silage the middle of September he had more than enough to fill his 50-ton silo, so turned the stock into the field where they grazed on the green corn stalks till the first of December.

At a meeting of the directors of the Bodega Cow Testing Association it was decided to charge the members 70 cents per cow for the season of ten months ending Sept. 1, 1917. Some time ago the Dairyman's Bank of Valley Ford presented the association with \$60 to be given in prizes. The National Bank of Sebastopol presented \$40 for the same purpose.

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

A. W. Morris & Sons Corporation have withdrawn their consignment from the Sacramento sale.

Sunnybrook ranch, Willets, reports the sale of an 8-months old registered Holstein bull to Ellis rancho, Gilroy.

W. L. Mitchell of Napa has just received from Wisconsin two bred heifers sired by Merry Maiden's 3rd Son.

A. B. Humphrey of Escalon reports high tests being secured from five of his Guernsey cows. Sales of young bulls have been good.

The Sacramento-Yolo Cow Testing Association reports 11 cows as having produced over 52 pounds of butterfat for April. Highest, 63.2

The Gridley Cow Testing Association reports 11 cows as having produced more than 55 pounds of butterfat during April. Highest, 63.6.

The San Francisco Dairy Exchange has voted to suspend operation of the rule allowing trading in futures.

Manufacturers of canned milk have assured the Navy Department of a sufficient supply to meet the needs of the navy.

F. Stenzel recently sold to H. L. Pylman of Sacramento county a young Holstein bull sired by Dutchland Sir Pietertje Creamelle and out of a 24-pound 3-year-old.

Dairymen of the central counties have organized the Central California Milk Producers' Association. Dairymen say that the price of milk has not increased in two years' time, while in the same period of time the price of feed has gone up by leaps and bounds.

Hereford Breeders to Organize.

A meeting of purebred Hereford breeders was held at San Francisco May 2, at which steps were taken to form a Coast organization. The meeting was attended by about thirty breeders and short talks were made by nearly all present. A committee of seven was appointed to draft constitution and by-laws and the organization will be completed at the State Fair, at Davis, May 29. The committee named was: Prof. G. H. True, W. D. Duke, D. O. Lively, Wm. Madden, H. H. Gable, D. B. Harris, E. B. Bemmerly.

Great Production for Gibson Holsteins.

The first six cows of the J. S. Gibson Company's Holstein herd to finish yearly tests made the following records:

Winnie Korndyke Cornucopia De Kol, age 9 years: Milk, 31,034.2; butter, 1,201. Princess Jetze, age 9 years: Milk 19,981.8; butter, 786.9. Mary Acme of Oakwood, age 7 years: Milk, 17,977.3; butter, 702.2. Hazel Aaggie of Oakwood Daughter, age 3 years: Milk, 21,208.5; butter, 860.9. Inka Tritomia Walker, age 2½ years: Milk, 21,237.6; butter, 816.1. Princess Niko Mechthilde, age 2 years: Milk 11,773.9; butter, 620.4. Average milk, 20,535.5; butter, 831.2.

More Records for A. W. Morris & Sons.

A. W. Morris & Sons Corporation report records as follows:

Aaggie Acme of Riverside 2nd, strictly official record, 150 days: Milk, 12,769.9; fat, 524.11; butter, 655.14. Molly Dekol Pontiac Mead, senior 2-year-old daughter of Segis Pontiac De Kol Burke; Butter, seven days, 20.23. Changeling Tidy Abbecker Gem: Butter, seven days, 34.74; butter, 30 days, 139.63; best seven days' milk, 750 pounds. Pauline Creamelle Mercedes: Butter, seven days, 30.25. Susie Dekol Canary Mercedes Burke: Butter, seven days, 28.90. Miss Dutch, a thirty-pound daughter of the 1,000-pound cow, Miss Blaney, has completed a year's record of 25,600 pounds milk and 1,025 pounds butter.

A Good Hereford Sale.

Bulls sold surprisingly well at the first California public sale of Herefords last week. Fifteen head brought an average price of \$466. Cows and heifers averaged \$307. Altogether fifty-four head were sold for \$18,970, a general average of \$351.

The sale was held at the D. O. Lively stock farm, Mayfield, and the consignors, beside Mr. Lively, were A. B. Cook, Townsend, Montana, and F. D. Tintinger, Park City, Montana. The buyers were J. D. Canary, Saratoga, Wyoming; W. J. Bemmerly, Woodland; Benj. Quigley, Linne; Chas. Rule, Jenner; J. A. Bunting, Centerville; Henry Struve, Watsonville; S. R. Crowe, Hayward; Rancho Del Canon, La Honda; Sierra Vista Vineyard Co., Minturn; Wm. Burgess, Amador; H. H. Cable, Esparto; N. B. McGahan, Stanford University; E. U. Buddicke, Roseville; W. D. Duke, Likely; A. L. Lillencrantz, Hol-

Butter (7 days), 28.36 lbs.

A FEW BULL CALVES FOR SALE AT
REASONABLE PRICES.

Alex Whaley, Prop.

Tulare, Cal.

Headed by PONTIAC DE KOL BURKE LUIT, whose dam, Luit Burke, made 32.76 lbs. butter in 7 days and 120 lbs. in 30 days. His sire's dam was Riverside Sadie De Kol Burke, one of the greatest milk and butter producers of the breed.

Young bulls of this combination are worth considering when you are purchasing a herd sire.

Do You Want Long Distance Backing?

We have a son of the California State Champion three-year-old for sale. Born October, 1915; Sired by PRINCE ALCARTRA KORNDYKE, whose dam is TILLY ALCARTRA.

The Dam of this young bull is not a fifty-lb. cow, but she has to her credit 21,208 lbs. milk and 860 lbs. butter in one year, which is the largest record ever made in California by a Junior three-year-old.

If you are in the market for a bull, it will pay you to visit our ranch and see what we have to offer—at prices that will surprise you.

J. S. GIBSON CO., Box 97, Williams, Cal.

lister; H. Talle, French; W. M. Marshall, Los Angeles, and Mayo Newhall of San Francisco. Mayo Newhall secured the two highest priced bulls for \$1,000 and \$750 respectively. The highest priced cow went to W. J. Bemmerly for \$800.

Holstein Breeders Entertained at Napa State Hospital.

Though not largely attended by Holstein men, the meeting of the California Holstein Breeders' Association at Napa State Hospital on May 5 was a very pleasant and enjoyable affair. An excellent lunch was served in the cow barn, while the hospital orchestra dispensed sweet music. F. J. Kiesel, president of the association, presided, and speeches were given by Emmet Phillips, president of the Board of Managers, Napa State Hospital; J. F. Neylan, president of State Board of Control; Judge Thos. Lennon; Assemblyman Bismark Buck and other dignitaries. President Phillips stated that they were getting more and better milk now than they got from twice the number of cows before they began breeding up the herd. Credit was given to Manager Owen Duffy for his work in developing the Holstein herd, the up-to-date dairy plant and the general productiveness of the 19,000 acres constituting the institution's farm.

A. W. Morris in his talk predicted prosperity for dairymen and breeders on account of the class of men going into the business and co-operative organizations. At the close of the banquet visitors were shown through the dairy plant and through the hospital wards.

High-Priced Dairy Bulls.

[Written for Pacific Rural Press.]

The foundation stock of the Holstein herd owned by McAlister & Sons at Chino, Cal., was secured by an importation in January, 1916, of four express carloads of cattle from New York. This was the largest shipment of fine cattle ever brought into California, over 100 head, costing over \$70,000, on which the express bill alone was \$4,000. In it was the herd sire King Segis De Kol Korndyke, purchased for \$10,000, who was at the time the highest priced bull in the West, but who has had to resign this honor in favor of the bull, "It," who was the former junior herd sire in the Steven Bros.' herd. "It" and King Segis De Kol Korndyke are being used exclusively to all of the cows in the McAlister herd. King Segis De Kol Korndyke is the sire of the first 40-pound heifer under full age and the present world's champion 4-year-old in the thirty-day division; while he is also the only sire with a 40-pound daughter to have a son with a 40-pound daughter. "It" is from the same dam, Pontiac Clothilde De Kol II. "It" has had five 2-year-old daughters to freshen thus far, one making 23.92 pounds in the hands of a small breeder, who had never previously made an A. R. O. record. Another made over 21 pounds and the other three all made over 19 pounds. He has over fifty A. R. O. daughters to freshen in the next two years, about half of whom will be from 30-pound cows.

Exercise and Wallows for Hogs.

[Written for Pacific Rural Press.]

Many times the show points on a purebred hog are characterized as "breeders' fancies" by market-pork producers; but in the main these points are based upon some good utility purpose. In no case is this more emphasized than in the bone development of breeding stock, for unless a meat-making animal has good, hard bone he is unable to withstand heavy forcing at fattening time.

The trick in developing good, heavy, hard bone in hogs is to furnish them exercise rather than keep them penned up in small lots, according to J. M. De Vilbiss of Patterson, Stanislaus county, who raises purebred Duroc Jerseys. To his mind the California farmer has exceptional opportunities in this direction because of the large areas of alfalfa which he possesses.

In his own operations Mr. De Vilbiss uses alfalfa fields both as a valuable food supply and as a bait to his hogs to get them to exercise. This latter feature is made possible by a long lane which leads from the hog pens to the alfalfa field, built purposely with the idea of making the hogs walk a long distance to green feed and an equally long distance back to water and shade.

When supplemented with grain, Mr. De Vilbiss believes that alfalfa pasture is worth \$75 an acre to the market hog raiser, and much more to the breeder of purebreds because of the increased value of his stock because of their registration.

Another feature which Mr. De Vilbiss has worked out in practical operation on his ranch that should be of value to the hog raiser in the warm interior valleys is providing a

wallow and a clean supply of drinking water.

In the first place, he doesn't believe in allowing hogs to wallow in cold water, thinking that they should have warm water the same as humans. He has also found that where a shade is provided over a wallow many hogs will lie by the hour in the water during warm weather, with the result that they contract rheumatism.

To overcome these objections he built a shallow wallow of concrete with a wall around three sides about 12 inches thick. The top of this wall was grooved out to form a drinking trough, the water being clean and fresh at all times. A disinfectant is used on the wallow at all times.

On one side of the wallow, but some distance away, a low thatched roof was built, with open sides, and on the other side a similar protection from the sun, with boarded-up walls, was erected. This with the intention of allowing the hog to use his own judgment as to the kind of shade he needed most after his bath; and it has been Mr. De Vilbiss' observation that certain hogs prefer one kind of shelter and others a different kind.

The practicability of his plan of developing big, strong bone is shown by the weight of his herd sire, Crimson Wonder II, who carries 800 pounds at two years of age without any indication of weak pasterns.

PIGS POT-BELLIED ON ALFALFA.

[Written for Pacific Rural Press.]

Pigs become pot-bellied when they run on alfalfa alone, is the experience of J. L. Cramer of Tulare county, also Harry Chamberlin of Sutter county, and others.

Mr. Cramer has 55 pigs 60 to 140 pounds that run on alfalfa and get 20 pounds of corn twice a day, to keep them from eating too much alfalfa and to strengthen their frames. He expects to increase the grain ration materially for two weeks before putting them into the fattening pen about June 15. Then he can market them before stubble hogs come in.

At the last meeting of the Duroc Jersey Swine Breeders' Association of Stanislaus county, held at Modesto, a talk was given by C. H. Connor, County Farm Advisor, on the "Food Values of Farm By-Products." He showed how by utilizing the waste products, such as sweet potato culls, canteloupes, pumpkins, fruit, etc., we can cheapen our hog ration and increase pork production at a good profit. He showed how the skim milk which is being sold to casein factories at 18 to 20 cents per cwt., if fed to hogs would displace grain to the value of 40 to 60 cents.

C. T. Thompson of Inyo county reports purchase of Pilot Defender, Duroc boar, from McKee Brothers of Kentucky. Pilot Defender was sired by Defender, a boar that was grand champion at the International Livestock Exposition held at Chicago in 1909 and 1910. Mr. Thompson has also another excellent Duroc boar in California Keen, recently purchased from the University Farm at Davis.

Grape Wild Farms Berkshires.

Who that has seen Grand Leader 2nd, the Grand Champion Berkshire Boar at the Panama-Pacific International Exposition, at the head of our herd for the past three years, has not been impressed with his outstanding qualities, his heavy bone, great depth, and scale? And who that has seen his get, numbering hundreds—on our farms, both at Escalon and Mayhew—has not been impressed with his prepotency?

Who that has seen and followed his winnings and the winnings of his production at all the Fairs where shown has not been impressed with the consistent and unsurpassed strength of that prepotence?

Therefore, what more natural when we parted with this great animal recently to a prominent Eastern breeder than that we should stand by the blood lines that have proven so successful through this boar's influence, and purchase another animal bred by his sire, the Great Superbus? And we now wish to announce—

We have purchased from W. S. Corsa of Gregory Farms, White Hall, Illinois, at as high a price possibly as was ever paid for a yearling boar, Royal Superbus No. 220200, to head Grape Wild Farms herd at Escalon. He is sired by Superbus and was not only First Prize Junior Boar at the Chicago International last year, but was also one of the young herd winning Second Get of Sire and similar honors for Produce of Dam.

Royal Superbus has already proven his Breeding power during the short time he was used by Mr. Corsa, and his get shows both smoothness and type in an impressive manner. A litter mate of Royal Superbus is owned by the Oklahoma Agricultural College, having been personally selected by Dean Carlisle, and another litter mate has been used in the herd at Illinois Agricultural College.

We have in our herd numbers of Brood Sows selected through years of careful breeding and a number of choice daughters of the Champion Grand Leader 2nd; will be bred to Royal Superbus to go through our Public Sale Ring in August, announcement of which will be made later.

OUR ENTIRE HERD IS CHOLERA IMMUNE.

NOTHING BUT GOOD RESULTS.

Have used GOMBAULT'S CAUSTIC BALSAM for more than 20 years. It is the best blister I have ever tried. I have used it in hundreds of cases with best results. It is perfectly safe for the most inexperienced person to use. This is the largest breeding establishment of trotting horses in the world, and use your blisters often.—W. H. RAYMOND, Prop., Belmont Park Stock Farm, Belmont Park, N.Y.

USED 10 YEARS SUCCESSFULLY.

I have used GOMBAULT'S CAUSTIC BALSAM for ten years; have been very successful in curing curb-bites, capped hock and knee, bad ankles, rheumatism, and almost every cause of lameness in horses. Have a stable of forty head, mostly track and speedway horses, and certainly can recommend it.—C. C. CHAMBER, Training Stables, 800 Jennings Street, New York City.

The Army's Requirements in Horses and Mules.

The passage of the selective draft measure by Congress makes certain the immediate preparation and equipment of an army of at least a million men in 1917. All preparations are being made for a war that will last three years, for, regardless of what civilians may think, army officials do not expect an early ending to the war into which the United States has been drawn. The requirements of cavalry, infantry and artillery regiments in horses and mules are set forth in a letter just received by the writer from the War Department, Washington, D. C., to be as follows:

Cavalry regiment—1,541 horses, 152 draft mules, 29 pack mules, 6 riding mules.

Infantry regiment—69 riding horses, 112 draft mules, 25 pack mules, 6 riding mules.

Artillery regiment—1,097 horses, 88 draft mules, 4 riding mules.

These are minimum requirements, and do not take into account transportation trains required to forward supplies from terminal points to field bases. In other words, the number of animals specified above refer only to those actually needed with the troops.

The war strength of a regiment of infantry is approximately 1,500 men; of a regiment of cavalry approximately 1,300 men; of a regiment of artillery consisting of six batteries of four guns each, approximately 1,146 men. While definite information as to the proportion of infantry, cavalry and artillery to be included in the new army is not yet forthcoming, it is generally understood among army officials that an artillery battery of four guns will be allowed for each 1,000 infantry. It seems probable, therefore, that the first one million men placed under arms by the United States will be composed of 500 regiments of infantry totaling 750,000 men, 125 regiments of artillery totaling 143,250 men, and 100 regiments of cavalry totaling 130,000 men, making a grand total of a little over 1,000,000 men. The proportion of artillery certainly will not be less, and may be more, as actual warfare on European battlefields has demonstrated that overwhelming superiority in the artillery branch of the service is essential to efficient operation by the infantry.

It may be argued that there is no probability that the United States will prepare 100 regiments of cavalry, but in view of the danger from the Mexican situation it appears to be the belief of well-informed army officers that at least that many cavalry regiments will be provided for in this year's mobilization.

To equip 500 regiments of infantry will require 34,500 riding horses, 56,000 draft mules, 12,500 pack mules, and 3,000 riding mules. One hundred and twenty-five regiments of artillery will require 137,025 horses, 10,000 draft mules, and 500 riding mules. The equipment of 100 regiments of cavalry will necessitate 154,100 horses, 15,200 draft mules, 2,900 pack mules, and 600 riding mules. The total number, therefore, required for the equipment of 500 regiments of infantry, 125 of artillery, and 100 of cavalry, will amount

to 325,625 horses and 100,700 mules.

The Army has at present only 70,000 head of horses and mules. This means that approximately 350,000 head of horses and mules must be bought within the next six months. No information has yet been received from the army authorities in regard to how the purchase of these horses and mules will be made. In the judgment of experienced horsemen, however, the purchase of so large a number of horses and mules within the limited time available can best be accomplished by setting a definite price to be paid by the army for the dif-

ferent animals that will pass inspection for their respective classes, and by establishing ten or fifteen inspection points where horses and mules may be tendered for inspection. This will permit dealers, large or small, or even farmers, to consign their horses directly to inspection points with definite information in regard to what they will obtain for them if they pass inspection. There seems to be no good reason why the producers of horses should not be permitted to sell them directly to the Government, if they pass inspection, instead of being obliged to sell them through some intervening contractor. It is earnestly to be hoped that the army officials will decide on some general plan.

It must not be forgotten that the

allied nations are still in the market, and will continue to be. Their need for horses and mules is as great as for guns and ammunition; indeed, even more so, because they can manufacture the guns and ammunition in their own countries, but their resources in horses and mules have already been exhausted, and the United States is the only source from which they can obtain additional supplies. 853,116 head of horses and 289,062 head of mules have been exported, practically all of them for war purposes, during the thirty months ending March 1, 1917. In spite of the shortage of ships, 40,000 head of horses and mules were shipped in January, 1917, and more than 27,000 head in February, 1917.

WAYNE DINSMORE.

GOODRICH

BLACK SAFETY TREAD TIRES

Must Make Good

WHEN a Goodrich Black Safety Tread Tire is sent from the factory of the B. F. Goodrich Company, it carries Goodrich's avowal that it is free from imperfection of material and workmanship.

It is the best non-skid fabric tire, the oldest, largest, most skillful rubber manufacturer can make.

It *must* render service worthy of the good name it bears—the high service Goodrich requires of it.

If, as occurs in rarest instance, it fails, the B. F. Goodrich Company is more eager than you that its shortcoming be made good.

Fair Treatment Open-Handed

The B. F. Goodrich Company *courts* honest fault-finding with its tires. Goodrich Fair Treatment will meet these complaints with adjustments, quick and square,—will make these adjustments gladly and generously.

It will not permit a Goodrich patron to feel that a Goodrich tire owes him anything. *It wants back any Goodrich tire you feel owes you anything.*

The B. F. Goodrich Rubber Co., Akron, O.

Also maker of the tires on which Dario Resta won the official 1916 National Automobile Racing Championship—Silvertown Cord Tires.

"Best in the Long Run"

Third of Cows in Best Dairies, Boarders.

[Written for Pacific Rural Press by Carl J. Williams.]

This report is made up from herds belonging to dairymen who have remained in the San Joaquin County Farm Bureau Cow Testing Association for an entire year's test during the last year and a half. During this time over one thousand individual cows have been tested; but no satisfactory records could be obtained for a great many of them as they were not in the association long enough. This report covers practically the full lactation period of 636 cows belonging to 12 dairymen:

Herd	Under 200	200 to 250	250 to 300	300 to 350	350 to 400	400 to 500	500 to 600	600 to 650	Over 650	Total
1	25	10	27	10	7	3	1	1	83	
2	14	9	8	3	1	1	1	1	34	
3	39	25	25	15	6	1	1	1	111	
4	7	6	3	3	1	1	1	1	20	
5	10	17	16	4	1	1	1	1	48	
6	1	11	6	1	4	1	1	1	24	
7	7	12	16	18	13	3	1	1	69	
8	4	15	6	5	1	1	1	1	30	
9	1	8	4	2	1	1	1	1	15	
10	28	10	18	7	1	1	1	1	63	
11	52	16	11	1	1	1	1	1	80	
12	26	8	14	4	5	3	1	1	60	
Total	214	147	154	71	38	12	1	1	636	

One cow produced over 600 pounds of butter fat during 12 months, and proved in a class by herself as no other cow came within 175 pounds of her mark. Of the 636 cows tested, 422 or 66.3 per cent of them paid a profit over the cost of their feed and care and 214, or 33.7 per cent, failed to pay for their keep.

In working out the cost of keeping a cow, 200 pounds of butter fat at an average price of 30 cents a pound, or \$60, is taken as the cost of feeding a cow a year. The value of her calf and manure is used to cover the cost of her care and milking. Interest on the investment or her depreciation is not included in the \$60, which is a very low figure for the cost of feed when it is figured at present market prices.

The average lactation period of the 214 cows which produced less than 200 pounds of butter fat in a year was about eight months. The shortest lactation period taken was four months; and there were several boarders which milked the full 12 months. A great many of these

boarders were sold after six months test, which was sufficient in all cases to detect them. Some of them are being held over for a second trial, as they were taken sick during their period of test and did not have a fair chance or else they were heifers with their first lactation period and are being tried again.

The work of the association is a great success and will do great things for the dairies of this county. One of the main troubles is that it is being used only by the best dairymen, who need it the least. If 33 per cent of the cows in the best dairies in San Joaquin county proved to be boarders last year it is no wonder that there is a cry among the others that there is no money in the dairy business. There should be 214 cows above the 600 pound mark instead of below the 200 pound mark. A 600 pound cow pays \$120 above the cost of her feed while a 200 pound cow is kept at a loss.

There is money in most any business if it is run on an efficient basis, and the dairy business is no exception. The keeping of books and the use of scales and the Babcock tester is as essential on a dairy as the use of scales and a bookkeeping system in a grocery store. Know what your product costs you to produce and you will know whether you are being cheated by your commission men or creamery or by your cows. A check on a full year's production of your individual cows is the only way to determine just what they are doing. The Cow Testing Department of the Farm Bureau was formed to do this work on the most economical basis possible. If you are not a member you had better look over the above report and figure out if you can afford not to be.

A two and a half million irrigation project is well under way in Victor valley which will ultimately furnish water for 30,000 acres of land.

Raising Poultry for Profit

TURKEY DISEASES.

(Continued from Last Week.)

LICE.

The next thing which gets turkeys, or perhaps one should put it first, is lice. They seem to attack turkey poults in greater force than chicks, perhaps because the turks are so quiet and peaceable. And lice weaken the poults so that they have little resisting powers for any other troubles that attack them. So we should take more pains to keep the lice down. Once a week something should be applied to young turks, or to the hens they run with, in order to keep them free from this enemy. Good reliable insect powder is as good as anything, because in spite of all the talk and all the schemes invented, unless they are watched, lice will multiply. In some of the States young turks are badly afflicted with gapes. Here we are not troubled with that disease, for which we should be thankful, for it must be an awful tiresome task to have to pull worms out of the young turks' throats.

BLACKHEAD.

The worst enemy, to the turkey tribe, is blackhead. While it started in the eastern States, we have a goodly share of it in California. Its greatest feature is that it is highly communicable. If one turkey has it, all the turkeys, old and young, would be in grave danger, because the disease comes both in endemic and epidemic form. It attacks the young first, probably because they are more susceptible, destroying 70 to 90 per cent of them before six weeks old, when confined in yards that are contaminated. Of those that escape after being attacked, 15 per cent die before they reach one year old. Once established on the farm it is hard to get rid of, even though you stop raising turkeys, for it is in the land; it gets in your poultry and it has really come to stay. The prevention is much easier than the cure. As long as there is a particle of danger from getting such a disease, it pays to be cautious where you buy eggs or young turks. Buy from reputable breeders even if you

pay twice the price. A recent bulletin says that there is not any known means of its eradication. Give the turkeys room; encourage them to ramble instead of hanging around yards where other fowls are.

DIARRHOEA.

Chicks that are afflicted with diarrhea usually recover when put on virgin soil, where if you allow them to stay in the same yards and on the same ground very likely all of them will die.

Besides keeping young turks' quarters clean and removing to new ground, the feed should be rather sparing until they begin to take plenty of exercise, when they will almost rustle their own. In the early stages, buttermilk or sour clabbered milk are the very best preventives known. The acid in the milk seems to keep the bowels in a condition unfavorable to the life of the blackhead germs. Of course, some use drugs, but it is doubtful whether they ever help.

The symptoms of blackhead in young turks are, listlessness, lagging behind, with wings drooped, and diarrheal discharges of an orange color. A post mortem usually discloses the fact that they have been sick longer than the owner thought, for all internal organs are thickened with inflamed walls, enlarged liver, and much inflammation of the various organs. Sometimes the liver has large creamy ulcers on it, in which case it may be concluded that the disease has gotten a strong hold before it was discovered.

SPROUTING OATS.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

From now on we can sprout oats or barley right out in the open and get a bunch of wiggly worms on each spade full. Soak the oats a few hours in warm water, then spread on a nice clean piece of ground so that the oats are about four inches thick. Cover with about one inch of dirt and sprinkle when needed; the more sprinkling you give the oats, the more worms you will get, provided the land is rich

enough to grow worms. When the oats show through just an inch of green, they are in such fine shape for eggs that your hens will repay you. For small chicks that have no other green feed, it pays to grow a little longer before serving. The chicks will digest every particle and grow like weeds.

This is the cheapest and best all around feed for growing chicks that we can serve. Oats are high, but they swell enormously and furnish bone and muscle for growing chicks in a larger proportion than almost any feed we have.

Last Saturday the George P. McNear Company and the Golden Eagle Milling Company of Petaluma issued a statement to the poultrymen of the section that they will guarantee to provide for their use 5,000 tons of new barley crop at a maximum price of 2 1/4 cents.

Poultry Breeders' Directory

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2 1/2 c per word.

BABY CHICKS—For May and June. We will have them—Barred Rocks, R. I. Reds, Black Minorcas, White and Brown Leghorns. They cost from 7 to 12 cents each, depending on breed and number. The combination is good quality and low price, because our plant is efficient, our hatching capacity is large, so we can operate on a smaller margin of profit and give good value for the money. Try us with a trial order. Our breeds are pure-bred and of the true utility class, bred for layers and hardness. Don't quit because grain is high—Eggs will be higher, and the laying hen is a good investment. Write for our circular and price list. Rooster Poultry Ranch and Hatchery, Campbell, Cal.

BARRED PLYMOUTH ROCKS—COCKERELS—Cockerels—Cockerels—Yes, we have them; also Hens and Pullets—all bred from our Champion Winners at California's leading shows. Also hatching eggs. If it's Barred Rocks you want, get in touch with me right away. Have bred them exclusively for nineteen years. Send for Catalog. Chas. H. Voden, Box 396, Los Gatos, Calif.

"FINEST HATCHERY IN THE WORLD"—Baby Chicks, White Leghorns, and Rhode Island Reds, settings, 100's, 1000's, hatched right in our \$60,000 brick and concrete hatchery from our quality heavy layers. Reasonable prices. Stock, Hatching Eggs. Pebbleside Poultry Farm and Hatchery, Sunnyvale, California.

MAY AND JUNE CHICKS—Will lay this fall if from our early maturing strain. Our Leghorns and Reds begin laying at 4 1/2 to 5 months. Leghorns, \$10 per hundred; Reds, \$12.50 per hundred. Brooke Farm (Rancho del Paso), 807 J St., Sacramento, Cal.

WHITE LEGHORN BREEDING COCKERELS—10 months old, from our famous heavy laying, prize winning stock. To make room we offer our regular \$5.00 values at \$2.50 each while they last. Rancho Del Marino, Downey, Cal.

BABY CHICKS—HATCHING EGGS—White, Buff, Brown Leghorns, R. I. Reds, Barred Rocks. Sturdy chicks from well-mated fowls. Prompt, efficient service. Write for circular. Campbell Poultry Ranch, Campbell, Cal.

HOGANIZED AND TESTED—220-egg type White Orpingtons and Buttercups. Hatching eggs, chicks and cockerels for sale. Reasonable prices. For particulars, write M. Woodhams, San Mateo, Cal.

S. C. RHODE ISLAND REDS—220-egg record in 12 months. Hatching eggs, Chicks, Stock. Also Rose Comb Reds. Mating list ready. Wm. Larm, 3915 39th Ave., Fruitvale, Cal.

WHITE WYANDOTTES—Persistent layers and Blue Ribbon winners. Eggs now \$1.50 and \$3.00. Chix 20c. R. W. Stawetski, Route 2, San Jose, Cal.

BABY CHICKS from S. C. White Leghorns from trapezoid hens with records from 192 to 297 eggs. Also S. C. Black Minorca chicks and eggs. J. W. Benoit, Route C, Modesto, Cal.

EASTMAN'S BRED-TO-LAY Barred Plymouth Rocks—chicks, eggs, cockerels. We hoganize and trapezoid. Fairmead Poultry Farm, Fairmead, California. Box P.

MODEL POULTRY FARM—White Leghorn specialists. Our thirteenth year. Baby Chix and Hatching Eggs for sale. W. C. Smith, Prop., Corning, Cal.

INCUBATORS—For Essex Model Incubators at factory prices, write Geo. H. Croley Co., Inc., Poultry Supplies, 631-637 Brannan St., San Francisco.

ANCONAS—First-class stock. Reduced price, \$2.50 per fifteen. Chicks, 25c each. Few choice birds for sale. J. R. Bell, Livermore, Cal.

CHICKENS, DUCKS, GESE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, Cal.

HATCHED CHICKS from Barred Rocks, R. I. Reds, White Leghorns. Good stock. Send for circular. G. L. Hawley, Madera, Cal.

WHITE PLYMOUTH ROCKS—Hatching eggs from splendid layers. Mrs. J. B. Tupper, Route A, Ceres, Cal.

TURKEYS, DUCKS AND GESE.

MAMMOTH BRONZE TURKEY EGGS—During May at \$2.50 per 10, \$20 per 100. M. M. Reiman, Planada, Cal.

FOR SALE—Mammoth Bronze Turkey Eggs. Eastern stock prize winners. Mrs. Robert Farrell, Bolinas, Cal.

BRONZE TURKEY EGGS—By the setting or hundred. Also fine young Toms. Albert M. Hart, Clements, Cal.

MAMMOTH BRONZE TURKEY EGGS—\$3.50 per setting. Toulouse Geese eggs, 25c each. Mrs. M. Coghlan, Walnut Creek, Cal.

System of Feeding
Our free book, *Chickens from Hatch to Market*, gives full particulars.
Coulson Co. Petaluma, Cal.

AVALANCHE OF POULTRY—EGGS MUST GO HIGHER.

The most serious situation in the history of California poultrymen is gathering force; and the storm will break within a month in the opinion of Secretary E. A. Forbes of the State Market Director's office. Conferences of the Market Director with the San Francisco Produce Exchange and leading poultrymen of Sonoma county show that flocks are being reduced at an unprecedented rate. Whereas, heretofore, the hardluck poultry stories have come from beginners who failed, now it is the big successful poultrymen of the class of P. R. Lyding, Knox Bande, and others who are selling out along with the rest. Geo. P. McNear, who has a fortune in feed accounts with poultrymen, is advising them to sell their laying stock so soon as production goes low, and get jobs elsewhere, leaving their families in Sonoma county. Some poultrymen still have feed bought at lower prices. The climax of the laying season is not yet past. When it is, about next month, and the cheap feed is gone, an avalanche of poultry will come, for feed is now double the price of a year ago; while eggs are very little higher. At a meeting in Petaluma recently the Mayor was asked to appoint a committee of 25 to deal with the situation. This committee is expected to provide facilities to care for the chickens until they can be killed, dressed, and cooled in Petaluma, then shipped to San Francisco cold storage houses to relieve the market. The effect of this wholesale reduction of flocks in the greatest egg producing center of the West, will be to send prices of eggs out of sight very shortly and keep them up.

There is one way for consumers to prevent this, which is to accept a rise of 5 or 10 cents per dozen now. Otherwise they may not be able to get them at \$1 a dozen later. Conferences are being held with the San Francisco Produce Exchange and other egg dealers to see if prices may not be raised enough to keep egg producers in business at least until fall feed comes.

Mrs. Best's Letter.

STYLES IN DRESS WEAR.

Dear Friends: The nearness of summer makes us all think over the state of the wardrobe, especially with regard to house dresses.

Morning dresses are made so attractively that, when clean, they can be worn any time of day. The most popular style is the one-piece dress, the skirt a plain gored and the waist a simple shirt waist style, open at the throat and short sleeved. The collar and cuffs are of a contrasting material or white, and the new note is the presence of fancy pointed pockets on the skirt. They are belted, of course, as everything seems to be this spring.

Another very attractive style is in two pieces, a loosely fitted middy blouse effect, buttoning down the front, slightly belted and worn over a gored skirt. This style is developed in many combinations—white blouse with striped skirt and collar and cuffs of the skirt material or the blouse of a solid color, blue or rose, and the skirt of an harmonious stripe. This style when developed in a pretty lighter weight material makes very pretty informal home dresses. Some of the stores call them porch dresses.

Old fashioned gingham is with us again and very pretty dresses can be developed from the use of soft plaids with trimmings of plain materials and buttons.

The shirt waist dress is very smart and is shown in crepes or linens in both solid colors and stripes.

For more dressy occasions, crepe de chine and Georgette crepe are very popular—the crepe de chine in white with embroidery of colors is wonderfully effective. These dresses are made on soft clinging lines, with the skirt much narrower than formerly. If there are pleats or gathers or even drapery, they are made to keep a comparatively straight line. Skirts that flare just below the hips are much more the exception than the rule.

For graduation dresses, that are also to be used as party dresses, net seems equally as popular as Georgette crepe.

These dresses are made with simple waists, some finished with a berth at the neck while others are plain. The skirts are trimmed with bands of silk or soft net ruffles piped with satin. Most of them are made over an inexpensive silk foundation and have silk girdles. If the dress is made up entirely separate from the silk slip it is possible to use slips of different colors that give the garment an entirely different appearance. The girdle should be of the color of the silk slip in that case.

Petticoats for wear with these dainty dresses are either of white silk trimmed with lace or silk jersey tops with pleated flounce or of fine white goods with flounces of Valenciennes lace. For wear with the morning dresses, the petticoats are made of striped gingham or white sateen or pique with scalloped edge.

ROSABELLA BEST.

USE OF STALE BREAD.

Bread is one of the items most commonly wasted in many American households. This waste is probably due to the fact that many house-

keepers do not know what to do with the odds and ends frequently found in the bread box. Bread a little too stale to be appetizing, but not yet hard, may be freshened by putting it into the oven for a few minutes. The heat seems to drive the moisture from the crust back into the center of the loaf, making the crust more crisp and the crumb a little more spongy. Some housekeepers moisten the surface of the bread and sometimes cover it before putting it into the oven.

Toast is a form in which partly stale bread can be made attractive. In many families it is served only for breakfast, or supper, but the custom which many high grade restaurants have adopted of serving thin, crisp, hot toast with the more substantial meals, might well be followed at home. Such dishes as chopped meat with gravy, creamed chicken or fish, poached eggs, melted cheese, cooked asparagus, Swiss chard, baked tomatoes, etc., are served very commonly on toast. Cream or milk toast (that is, toast with a cream sauce or milk gravy, perhaps flavored with a very little chipped beef, salt fish, or other savory) may be used as the main dish at breakfast, luncheon, or supper. Slices of toast may also be dipped in water or milk and beaten egg, and lightly browned on a hot greased pan.

Another good way of using stale bread is to put the pieces in the warming oven or on the back of the stove and leave them until they are crisp and a delicate brown throughout. This is often called twice-baked bread and is very popular with children and also with grown-ups who like its "crunchiness" and the flavor which comes with the slight browning.

There is nothing new in the idea of using bread crumbs in cookery and most housekeepers are in the habit of having some on hand for use in scalloped dishes, stuffing for meat, puddings, etc. Few realize, however, how much more generally they might be utilized. Any bits of bread which can not be eaten on the table should be saved and crumbed for use in cooking. To prevent their growing musty, they should be kept in dry, air-tight containers. Fruit jars are often convenient for the purpose.

VALUE OF FRUIT.

There is nothing in the food line that so clears the skin as well as the brain as a diet of fresh, well ripened fruits. Apples are the finest spring tonic that can be found, while oranges are an aid to digestion and a sedative to the nerves. Pineapple juice is called a vegetable pepsin, strengthening the digestive powers, and both grapefruit and rhubarb are excellent spring tonics.

MANGELS.

Nothing yields such a quantity of real food value as mangels. Boiled tender, then chopped, and a piece of butter put in with vinegar, they are wholesome and satisfying.—S. S., Pomona.

THE HOME CIRCLE

THE PRESERVATION OF VEGETABLES WITHOUT CANNING.

[By Prof. Wm. V. Cruess, University of California.]

We have become so accustomed to using vegetables from cans, (or fresh), that we do not realize that they can be successfully preserved in palatable and nutritious forms by other methods. The scarcity of tin cans and glass jars makes it imperative that these other methods be used this season if any great quantity of vegetables is to be kept for use next winter. The methods described below are not especially new, but it is believed that they are not all generally known. They are very simple, cheap, effective, and can be used from the smallest to the largest scale.

DRYING VEGETABLES.

All root vegetables, such as potatoes, carrots, turnips, beets, etc., can be dried successfully by exposing them on trays to the sun. The vegetables should first be washed, peeled if necessary, cut into pieces about one-fourth of an inch thick, spread on trays or sheets of paper, and exposed to the sun until dry. Potatoes, carrots, turnips, and beets will dry in this way in two to four days. Onions require longer.

The appearance and general quality of all these root vegetables (especially potatoes) can be improved, the rate of drying can be increased, and molding during drying in foggy weather can be avoided if the vegetables are exposed to the fumes of burning sulphur a short time before drying. An ordinary fruit sulphuring box may be used for this purpose. If one of these is not available, the cut vegetables may be sulphured by exposing the trays to the fumes of burning sulphur in any fairly tight room or box. A box may be constructed of rough boards and covered with building paper to make it fairly air-tight. Cleats may be nailed to the inside walls to hold the trays during sulphuring. The box is made without a floor and one side is made into a door to admit trays. A hole about a foot square and 12 to 10 inches deep is dug in the ground at one end of the box. A pan of burning sulphur is placed in this hole after the trays have been stacked in the box. The door is closed and the vegetables left until sufficiently sulphured. The time necessary is from 10 to 20 minutes. The vegetables are then exposed to the sun on trays or paper till dry.

Peas and string beans should not be sulphured because of the bleaching action of sulphur fumes. Peas should be shelled and string beans should be strung before placing them on trays. Both dry rapidly.

Corn is cut from the cob and dried on trays successfully.

Dried vegetables must be kept in covered crocks or tight boxes or heavy sacks to prevent insect injury. Before being used for cooking, the dried vegetables must be soaked in water about 24 hours. They may then be cooked and served in ways similar to those used for fresh vegetables. By proper seasoning and

preparation, dried vegetables can be made into palatable dishes. Their nutritive value is not perceptibly changed by drying.

BY SALTING.

Wash, peel, and cut the vegetables into pieces about one-fourth inch thick. Weigh them. Weigh out one pound of salt to each three pounds of vegetables. Place a thin layer of salt in the bottom of a crock or barrel or wooden bucket in which the vegetables are to be stored. Then build the vegetables and salt up in alternate layers until the container is full, using one pound of salt to three pounds of vegetables. Cover the vegetables with a layer of salt. Place a piece of wood on top of the vegetables and a heavy weight on the piece of wood. In 24 hours the vegetables will be found covered with a heavy brine formed by the salt and the juice from the vegetables. The vegetables will have greatly decreased in bulk. More sliced vegetables and salt in the ratio of one pound of salt to three pounds of vegetables may be added to fill the jar or barrel and pressure applied again. Keep the vegetables emersed in this brine by means of a light wooden weight until they are to be used. If they show signs of spoiling add more salt. Before cooking, soak out the excess salt as is done with salt fish, or parboil a short time for the same purpose. Do not use metal containers for storage of vegetables, because metal will dissolve in brine. Use crocks, barrels or wooden containers.

IN BRINE.

Make a saturated brine by stirring $3\frac{1}{2}$ to four pounds of salt in a gallon of water. If it does not all dissolve at once, leave it in the liquid because it will dissolve when the vegetables are added later. Wash the vegetables. Slicing is not necessary. Place them in the brine and keep immersed by wooden weights, until needed. If signs of spoilage are noticed at any time, add more salt.

Vegetables may be kept in salt or brine indefinitely and make good substitutes for the canned or fresh vegetables. The most expensive grade of salt is not needed. It would pay communities to buy salt by the ton or half-ton lots direct from large salt dealers if any great quantity of vegetables are to be put up. A good grade of salt may be had for about \$8 per ton.

EGGLESS FRUIT CAKE.

One and $\frac{1}{2}$ cups sugar, 3 cups flour, $\frac{1}{4}$ cup shortening, 1 cup raisins, 1 teaspoon each of cinnamon and nutmeg and $\frac{1}{2}$ teaspoon of cloves, 2 teaspoons baking powder, 1 teaspoon soda in 2 cups of sour milk. Mix together the sugar, flour, shortening and spices, like pie crust, and take $\frac{1}{2}$ cup of this mixture out before adding other ingredients. After the ingredients are thoroughly mixed and poured in a greased pan, sprinkle the $\frac{1}{2}$ cup of dry mixture over the top for frosting and bake 30 minutes in rather a slow oven.

FRENCH DRESSING.

Mix together $\frac{1}{2}$ teaspoon salt, little pepper, 2 tablespoons vinegar or lemon juice, 4 tablespoons olive oil; beat thoroughly. A bottle is a good thing to shake it in and can be kept just for that purpose.

Good Health.

[By H. E. Pastor, M. D.]

The Balanced Ration for the Human Animal.

All stock-raisers pay close attention to the ingredients of the ration fed to their animals of whatsoever description. They themselves, however, gulp down their own ration with little or no thought of its composition or the proportion of its constituents. If they fall sick as a result of this neglect their ailment is regarded merely as the dispensation of an unkind Providence, or an unfortunate hand dealt out in the daily shuffle of life. In short, the result is accepted as a matter of course. As a matter of course, too, the remedy is a hasty dose of squills, calomel and jalap, asafœdita, or a patent pill of sugar-coated nastiness—and time for Mother Nature to correct in some measure the bodily disturbance arising from this wrong course of dietetic living.

Now, inasmuch as a large number of people never think of thinking for themselves at all, a paternal government has seen fit to hire a staff of food experts to teach its wards—and that means all of us,

dear reader,—something about the makeup of their own ration. The result is a circular issued by the United States Department of Agriculture on how to select foods, and the reasons why in brief. It seems strictly orthodox from a medical viewpoint, so we venture to reproduce it in part:

FRUITS AND VEGETABLES.

These contain the necessary mineral substances for building up the body and keeping it in good working condition; acids which give flavor, prevent constipation, and serve other useful purposes; and in minute quantities lime salts, compounds of phosphorus and iron, and other substances necessary to good health. By giving bulk to the diet they make it more satisfying to the appetite. Foods depended on for mineral matters are: Apples, pears, berries, oranges, lemons, bananas, melons, etc.; salads, lettuce, celery, green peas, beans, tomatoes, squash, "greens," potatoes and root vegetables.

MEAT AND MEAT SUBSTITUTES.

These are sources of an important body-building material, protein. In the case of children part of the protein food should always be whole milk. Foods depended on for protein are milk, skim milk, cheese, poultry, eggs, meat, fish, dried peas, beans, cowpeas, nuts.

FOODS RICH IN STARCH.

Foods depended on for starch are cereal grains, meals, flours, cereal breakfast foods, bread, crackers, macaroni and other pastes, cakes, cookies, starchy puddings, potatoes and other starchy vegetables.

SUGAR.

Unless some of the fuel is in this form the diet is likely to lack flavor. Foods depended on for sugar are sugar, molasses, sirups, honey, candies, sweet cakes and desserts, fruits preserved in sugar, jellies and dried fruits.

FOODS RICH IN FAT.

These are important sources of body fuel. Without them food would not be rich enough to taste well. Foods depended on for fat are butter and cream, lard, suet and other cooking fats, salt pork and bacon, table and salad oils.

Of course, some food materials lap over several groups. Cereals, for example, supply protein as well as starch; potatoes supply starch as well as the mineral matters, acids, cellulose, and body-regulating substances, for which they are especially valuable; and most meat supplies fat as well as protein. Serve meals that have sufficient variety and do not cut down in the wrong places when economy either of time or money is needed.

A YOUNG FINANCIER.

Russell Huckabee, aged 13 years, of San Jacinto has just started an investment system with two white leg-horn hens. His mother's hens are all barred rocks which lay brown eggs, so he can easily tell when either of his two hens lay on account of getting white eggs. All the white eggs his mother buys from him, paying him the market price, but deducting five cents a dozen for the feed that his chickens eat. Eventually he will have more hens, as he has just borrowed two of his

ALL THE YEAR 'ROUND

Cooler cooking in summer—better and more economical cooking all the year 'round.

A good oil stove will cook anything that any wood or coal range will cook, and do it better because of the steady, evenly-distributed heat.

All the convenience of gas. Meals in a jiffy, and a cool kitchen in summer.

The long blue chimneys prevent all smoke and smell.

SAN FRANCISCO.

San Francisco, May 9, 1917.

WHEAT.

The local grain market has been in such an unsettled condition during the past week that spot quotations are hard to obtain. Available holdings are so light that the least sign of an advance in the East causes holders here to jump their asked figures about twice as much as the Eastern advance, and vice versa on declines. The stocks of Northern Club have been pretty well cleaned up.

There was little or no trading in spot barley here during the past week on account of the light holdings, although more of the current sales commanded the top asked figure of \$5.15 per cental. Futures trading on the floor of the Merchants Exchange showed a very decided gain on the May option and fair-sized advances on December stock. The crop outlook in this State has shown no marked improvement, and cutting of the small volunteer crop has already begun.

Shipping, cti. Nominal
Brewing, cti. Nominal
Choice feed, cti. \$3.00@3.15

BARLEY.

One decline and one advance marked the price changes in the bean list during the past week, with trading slowed up very noticeably. This is mainly the result of the rapid cleaning up of present holdings, some lines being so scarce that it is estimated on the street that it would require the holdings of three or four dealers to supply five carloads. Bayos eased 25c per cental, this demand having fallen off as a result of the high prices. The cleaning up of most of the first quality stock of this variety was also a factor in the easier market here for bayos. Shipping orders from Alaska put Garbanzos up to 77c per cental for fancy grades. More contracts were reported to have been let at very good prices, the reported prices being 10 1/2c on large and small whites and 10 1/2c on limas.

Bayos, per cti. \$11.25@11.50
Blackeyes 9.50@10.00
Cranberry beans 11.50@12.00
Horse beans 7.00@7.50
Small Whites (south) 14.00@16.00
Large Whites 14.00@16.00
Pinks 12.00@12.25
Limas (south, re-cleaned) 16.00@16.25
Red Kidney 12.50@13.00
Mexican Reds 11.00@11.50
Tepary beans None offered
Garbanzos \$6.00@7.00

CORN.

Would-be buyers of corn faced much the same situation during the past week as those who tried to purchase wheat, the market varying with every wire received from the East. California sacked failed to share in this uneasiness, but Egyptian corn advanced to \$4.10@4.50 per cental, with as high as \$5 paid for fancy seed stock.

First-hand prices on strictly first-class grain, San Francisco:
Eastern Yellow, cti., bulk. Unsettled
California, sacked \$3.45@3.50
Milo Maize None offered
Egyptian \$4.10@4.50

HAY.

The past week saw no changes made in the asking prices on carload lots of hay in San Francisco, but there was nothing in the market tone to indicate that lower prices could be expected immediately. Arrivals for the week were 1,204 tons, as compared with 1,220 tons for the week previous and 1,375 tons for the week before that. Of the current receipts, only half was California stock, with the remainder coming from Oregon and Washington. The relief furnished by this outside stock can readily be seen, with the market holding steady on shipments twice those coming from California points.

Wheat, No. 1 \$33.00@35.00
No. 2 28.00@30.00
Tame oats 28.50@33.00
Wild oats 24.00@29.00
Barley 27.00@30.00
Alfalfa 24.00@27.00
Stock hay 16.00@18.00
Straw, per bale 1.00@1.25

FEEDSTUFFS.

The local feedstuffs market was ruled by a decidedly firmer undertone during the past week, and advances on a number of lines were noted. Coconut cake or meal, rolled barley and rolled oats showed the heaviest gains. A few small lots of rice middlings, not enough to warrant the inclusion of this feedstuff in the list, went on sale here, and commanded \$37.00@40.00 per ton, according to quality.

(Per ton, San Francisco.)
Beet Pulp, per ton None offered
Alfalfa meal, per ton \$34.00@35.00
Bran, per ton 46.50@48.00
Oil Cake None offered
Coconut cake or meal \$36.00@37.00
Cracked corn 72.00@73.00
Middlings 55.00@60.00
Rolled Barley 62.00
Tankage None offered
Rolled Oats \$60.00
Rice middlings None offered
Rice bran 35.00@36.00
Shorts \$52.00@53.00

POTATOES, ONIONS, ETC.

Present conditions in the vegetable market are hard to render quotations on, because of the possibility of an extended strike on the river boats. Should this develop, it will mean a shortage here of delta products and a consequent boosting of prices on most offerings. With only one boat tied up, asparagus prices for Wednesday showed a gain and fancy graded lots sold as high as \$3.25 per lug.
Asparagus, per box \$1.25@3.25
Peas, per sack 1.25@1.75

Bermuda (seed), per cti. \$2.25@2.75

POULTRY.

Small chickens, laying hens and old roosters continue to form the bulk of the local offerings, and all of these lines registered lower prices during the past week. The offerings of old roosters is common at this time, but the other two varieties are coming in because of the high prices asked for feed. A committee from the Associated Poultry Producers of Central California and the local Produce Exchange is planning an advertising campaign to get the housewife to eat more chickens.

BUTTER.

Butter quotations closed the week 1 1/2c higher than on the opening day, despite a noticeable increase in receipts. A good shipping demand was directly responsible for this, as increases in ice-house holdings here were but 1,500 pounds, and this stock will only be kept in there for thirty days. However, the local trade is gradually working around to the belief that butter prices have very nearly touched bottom, and a number of dealers say that they intend to start storing for the season next week, in case no decline occurs in the quotations.

Thurs. Fri. Sat. Mon. Tu. Wed.

Prime 1sts 33 33 1/2 33 1/2 34 1/2 34 1/2

EGGS.

Receipts of eggs during the past week showed a marked increase as far as the pullets grade was concerned, and this grade closed at easier prices, while both washed and unwashed extras advanced. This is said to be due to the fact that so many laying hens are being killed on account of the high prices for feed, and the older hens are killed first on the theory that the pullet has a longer period of laying usefulness before her.

Thurs. Fri. Sat. Mon. Tu. Wed.
Extras 32 1/2 32 1/2 32 1/2 33 33 1/2

Peaches, 1917 7 1/2 @ 8 1/2 c

BERRIES.

Increased receipts of berries have been constantly bringing prices down, while the California Packing Corporation is taking all stock not sold by the eleven dealers chosen to represent the Growers' Association by nine o'clock each morning. Four cents per pound is being paid by the canners, a very good increase over prices paid by them last year.

Strawberries (per chest):
Southern \$5.00@6.50
Fresno 5.00@7.00
Longworth 8.00@9.00

HOPS.

While handlers of hops were daily expecting further declines, the market held about steady during the past week. This was the result of the lack of interest on the part of buyers, and it is thought here that any earnest efforts to buy now would mean a lowering of the asked price here.

Sacramento 5 1/2 @ 8c
Sonoma 6 @ 9c
Mendocino 7 @ 9c

HONEY.

Local dealers are still marking time as far as active buying of honey is concerned, with a firm undertone ruling the market. Reports from Hawaii indicate that the production there this year will be a little short of the normal.

Prices in San Francisco:
Comb, water white 13@15c

Special Citrus Market Report

Los Angeles, May 8, 1917.

Shipments of citrus fruits from southern California from November 1 to May 3: Oranges 22,000 cars, and lemons 3,762 cars. Same time last year: Oranges 18,878 cars, and lemons 3,025 cars.

The market the past week held up fairly well. In the Eastern markets the best of popular sizes met with a very good demand and closed the week a little higher after opening a little lower. Average prices remain much the same as a week ago. Receipts good and the less well known brands and small fruit sold slow and lower. That is navels. No Valencia moving as yet. Locally the market was very quiet. The navel season is pretty much over and packers are holding back and buying sparingly. The larger sizes of highly colored fruit met with a fair demand, but small sizes were very dull. What few sales made were at old prices for oranges, 1 1/2c per pound in the grove picked. Grape fruit dull at last week's decline. Packers buying but few and paying 1 1/4c per pound

in the grove picked. Lemons very draggy, even at the decline of last week. Packers only offering 1/2c per pound in the grove picked for the best. Poor have to be sold for what they will bring.

AUCTION SALES.

New York, May 7.—Sales today were: Forty-nine cars navels, one car Michaels, one car sweets, five mixed navels, bloods and tangerines, and three cars lemons. Better demand for oranges. Prices of all grades 10 per cent higher. Some fancy, 15x20c higher. Lemons easier. Attendance good. Weather cloudy. California navels averaged \$1.45@3.00; bloods, \$1.70@2.13; Michaels, \$1.70@1.97. Lemons averaged \$2.00@2.90.

Boston, May 4.—Seventeen cars sold. Market higher on oranges, unchanged on lemons. California navels averaged \$1.30@3.15. Lemons averaged \$1.40@1.65.

Philadelphia, May 4.—Eight cars sold. Market higher on oranges, unchanged on lemons. California navels averaged \$1.35@2.65. Lemons averaged \$1.80.

GRAIN BAGS SCARCE—BUY EARLY.

Grain growers who have not bought bags for the coming crop may well prepare to handle their grain in bulk unless their local merchants have a supply. The Prison has sold all the bags it can make to the end of July, though one grower recently was guaranteed delivery of 50,000. Previous to last year 50,000,000 to 60,000,000 grain bags have come to United States from Calcutta annually. Last year about 35,000,000 came. This year the total supply available is estimated at 32,000,000, most of which is enroute now. These have practically all been sold into second hands by the importers. The price now is 11 1/4 to 12 cents, with good prospects of increase.

LOS ANGELES.

Los Angeles, May 8, 1917.

BUTTER.

Receipts of week ending May 8 246,950

Receipts of same week last year 324,500

There was quite a dropping off in the receipts the past week, and the market here ruled steady and firm up to Monday, when, in sympathy with a higher market in San Francisco, extra creamery was bid up 1c and no sellers. The local consumptive demand holds up fairly well and there was some shipping movement. The volume of trade, however, was no better than a year ago. There was some buying for storage from the outside, and the cold storage holdings now are 44,403 pounds greater than this time last year. In Chicago extra creamery declined 1/2c up to Monday, the market there then being 38c against 38 1/2c the same day last week. In New York the market for the same time lost 1/2c, extra closing there Monday at 40c. This weakness East, however, had no influence upon the market here on the coast, which is being controlled by a good shipping demand from the north and no increase in the production. Tuesday brought no change. On call there was nothing doing, no bids or offers, and the market was left the same as the day before. The East and San Francisco were also unchanged.

EGGS.

Receipts (railroads) for week ending May 8, 1917, 3,366 cases.

Receipts (railroads) for week ending May 8, 1916, 4,565 cases.

There was less life to the market on 'change the past week than for some time. Receipts were much the same as the week before and there was a very fair consumptive demand and some little shipping movement to nearby points. There was little disposition to buy for storage at the present high prices. Stocks in cold storage here now are 13,725 cases greater than this time last year, and they have been bought at prices averaging about 9c to 10c higher than last year. In San Francisco the market showed no change up to Monday, while in Chicago first advanced 1c up to Monday and in New York 1 1/2c to 2c. This improvement East, however, failed to influence the market here, which was controlled by local influences. Still prices are 10c higher than this time last year, due as much to the high cost of production as anything else. Poultry people claim that at present prices they are making nothing the receipts were light and San Francisco was up 1/2c, yet the market lacked life. On 'change there was nothing doing and the market was made the same as the day before.

POULTRY.

The market continues quiet and weak. Receipts of light hens and broilers continue liberal, being driven in by the high price of feed. Light hens and broilers have been marked down again and heavy hens, roosters and fryers remain steady, and turkeys and ducks are unchanged. Heavy hens and fryers in fair demand, but all else slow sale.

We quote from growers:
Broilers, 1 1/2 to 2 lbs. 20c@21c
Fryers, 2 1/2c to 3 lbs. 23c
Hens over 4 lbs. 18c@19c
Hens under 4 lbs. 14c@15c
Ducks 20c
Geese 15c
Roosters, 3 lbs. up (soft bones) 20c
Turkeys, heavy, 12 lbs. and up 20c@30c
Turkeys, light 24c@25c
Squabs, live, per doz. \$1.50@3.00
Dressed 3.75@4.85

BEANS.

The advance noted a week ago is being maintained. The demand, however, was only fair and mainly confined to seed. Stocks are light and holders claim that what beans being held will be needed for seedling purposes and are firm in their views in spite of the slow movement. The trade continues out of the market and is taking but few beans at present high prices.

We quote from growers:
Limas 18c
Large white 15c
Small white 15c
Pinks 13c
Blackeyes 12c@12 1/2c

HAY.

A little more coming in and the market is weaker. Some new alfalfa is coming in and it is selling lower. Grain hay unchanged but weak. A fair demand is being had from the country, but the dairy people are buying but little hay, using mostly green alfalfa. With increased receipts it is thought that the market will work lower.

We quote f. o. b. Los Angeles:
Barley hay, ton \$21.00@23.00
Oat hay, ton 22.00@24.00
Alfalfa, northern, ton 19.00@20.00
Alfalfa, local, ton 20.00@21.00
Straw, ton 11.00@12.00

NEW VEGETABLES.

A steadier and more healthy tone pervaded this market the past week. Offerings were better, and the increased supply brought a better demand, as most of the vegetables are now in reach of the average consumer. Cabbage coming in quite freely and a little lower, but fair demand. Asparagus continues to glut the market and sells very cheap. New pota-

BUMPER RICE CROPS IN ASIA—FREIGHT RATES HIGH

Practically every rice-producing country in the Far East has a rice crop far above the average, and some of these countries have bumper crops. Prices on the Hong Kong market are comparatively low; but at present it is almost impossible to get adequate freight accommodations; and freight rates are still further advancing. The total turnover on the Hong Kong market during 1916 was estimated at 820,000 tons, compared with about 800,000 tons in 1915 and 720,000 tons in 1914. The West Indies and Central and South American countries had been importing from the Far East largely via German ports before the war, but are now importing through the United States.—Consul General G. E. Anderson, Hong Kong, China, Mar. 14, in U. S. Commerce Reports.

atoes are weaker under steady arrivals, but demand fair. New onions are also off a little, but sell fairly well. String beans coming in more freely and a little lower. Summer squash is now coming on the market, both from the Imperial Valley and from local growers.

We quote from growers:
Cabbage, per cwt.\$2.00@2.25
Asparagus, per lb., local and north-ern3@4½c
New potatoes, per lb.5@6c
Peas, per lb.3½@4½c
New onions, silver skins and Ber-muda, per crate\$1.60@1.75
String beans, wax, per lb.9@10c
do, Kentucky Wonder, per lb.10@11c
Summer squash, per 4-basket crates\$1.20@1.25

BERRIES.
A steady and somewhat firmer market was had the past week. The abundance and cheapness of strawberries caused freer buying and more liberal consumption.

Prices are now so low that strawberries are in the reach of the poorest. Demand very good at the prices. Blackberries are coming in more freely and lower, but in fair demand. A few raspberries were in during the past week, but they were high, selling at 18c to 20c per basket.

We quote from growers:
Strawberries, poor to choice, per 30-basket crate90c@1.00
Fancy, per 30-basket crate\$1.20@1.25
Blackberries, per 30-basket crate. 2.75@3.00
Raspberries, per 30-basket crate.. 5.00@5.50

HONEY.
There is no change to note in the honey situation here since a week ago. The weather continues unfavorable for the accumulation of any amount of honey by the bees. The past week was another one of chilly nights and partly cloudy days. No honey is being extracted and none marketed, hence we are unable to give quotations.

Special Livestock Market Report

San Francisco, May 9, 1917.

Hay fed cattle command ½c@¾c above grass fed.
Grass Cattle—
Steers, No. 18½@9 c

Southern, 7 mos.22@23c
Imperial Valley, 7 mos.30@35c
Nevada, year's35@40c

Los Angeles, May 8, 1917.

CATTLE.—A weak and slow market was had the past week. The offerings were the best for some time, the high price of feed and drying up of pastures making country holders more anxious to realize. Some grass cattle are also arriving, which is having a weakening influence upon the market. California and Arizona furnished most of the arrivals and the cattle coming in were in fair condition. Calves continue dull and weak. A good many arriving.

Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs.\$9.50@10.00
Prime cows and heifers7.50@ 8.00
Good cows and heifers7.00@ 7.50
Calves8.00@ 9.00

HOGS.—The market remains much the same as a week ago. A very fair run of young half fat hogs were had during the week, mainly from California, but choice grain fed hogs were scarce and continue to command a premium over general receipts. A few Arizona hogs were in, but they were generally light weights. No Idaho hogs received, they still being drawn east by the high prices there.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 250@300 lbs.\$11.50@12.00
Mixed, 200@250 lbs.12.00@13.00
Light, 175@200 lbs.12.00@13.00
Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP.—More sheep were offered the past week than for some time and ewes are down \$1.00 per cwt. The high price of feed and good prices that still prevail and less urgent demand for mutton and lamb causing killers to hold back and they are wanting fewer sheep and lambs. California and Arizona furnished most of the supply and as a rule the offerings were in fair flesh, though the lambs were hardly so fat as previous years.

Per cwt. f. o. b. Los Angeles:
Prime wethers\$ 9.00@10.00
Prime ewes8.50@ 9.00
Yearlings10.50@11.00
Lambs13.00@14.00

North Portland, May 7, 1917.

CATTLE.—Today's cattle market opened with only 500 head, but a string of California grassers received during the day swelled the total to about 1,000 head. The market opened strong with steers moving at steady prices, while cows scored another 25 cents advance. The California grass steers while not fat were better than expected, considering the hard winter. Heavy hay feds sold well with several loads of light grain feds.

BEEF STEERS.—There was a liberal supply of beef steers here today. Prices were mostly steady with a week ago. One load of light grain fed steers sold early at \$11.25, which was probably a little higher with a week ago with another load going at the same price, although they were the better cattle. Heavy beef steers sold up to \$11.00, with a load at \$10.75. Eight loads of grassers sold at \$10.25 straight, but were not of extra good quality. Medium grades of hay steers sold from \$9.75 to \$10.00.

COWS AND HEIFERS.—Demand for cows continued very good today with a good run. A load of fairly good cows sold at \$9.25, with a few small sales at higher prices. Fair to good cows brought \$8.75 to \$9.25, while ordinary grades sold from \$8.00 to \$8.50. Thin dairy kind \$6.00 to \$7.50.

BULLS.—There were only a few bulls on the market with but little demand. Prices ruled steady in most cases. There were no strictly fat heavy bulls here, but are selling from \$8.00 to \$8.50; medium heavy bulls sold from \$7.50 to \$8.25, with ordinary kind down to \$6.50.

HOGS.—Killers made another attempt to break the hog market here this morning, but as usual it did not amount to much. Speculative demand made them take notice and when trading began it was on a basis fully steady with a week ago, in all cases except pigs, which suffered a 25 cents decline in some sales. There was a fairly good supply over 2000 head. Best heavy hogs sold from \$15.75 to \$15.85, while prime light hogs brought \$15.60 to \$15.70. Good light hogs sold down to \$15.45.

SHEEP.—There were no sheep on the market today, and prices remain steady.

Publisher's Department.

Two hundred and fifty two new paid subscribers were added to our list during the week ending May 5.

Mrs. R. S. Spaulding of Woodland writes: "I find the Rural Press the best paper I have ever advertised in." Mrs. Spaulding's specialty is purebred poultry.

If you are interested in dairying and livestock, keep this issue on file for future reference. The announcements of many of the foremost California breeders will be found in the advertising columns, in addition to those of the supply dealers.

BASSETT'S POLAND CHINAS

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Announcement Extraordinary!

We desire to announce that we have just purchased the

Famous Herd Sire "IT"

"IT"

"IT"

"IT"

"IT"

IN our endeavor in the last year to purchase a herd sire that would stand second to none in the United States in respect to breeding and individuality, we finally decided that our requirements could only be fulfilled by that wonderful bull, "It," the widely noted herd sire in the Steven Bros. herd, Liverpool, N. Y.

HIS BREEDING in respect to great yearly butter production is unequalled by any other bull in the world. His dam, Pontiac Clothilde De Kol 2d, was the first cow to make 37.21 lbs. butter in 7 days, 145.29 lbs. in 30 days, or 1,271.6 lbs. in a year. She is the only cow in the world to ever make 1,000 lbs. fat in a year to ever come back with a 30 lb. record the next freshening. Her seven days' records from two to eight years of age as a whole have never been equaled.

HIS SIRE, King Korndyke Hengerveld Ormsby, has 34 A. R. O. daughters, including three over 30 lbs. His full sister has made over 1,000 lbs. fat in a year.

HIS SIRE'S dam, Pieterje Maid Ormsby, has twice broken the world's record for 30-day production. She made 35.56 lbs. butter in 7 days and 145.66 lbs. in 30 days.

HIS OPPORTUNITY has already served to make him one of the most noted sires of the breed. He has been used almost exclusively in the last four years upon daughters of

King of the Pontiacs, the greatest sire of the breed in respect to number of 40 lb., 30 lb., 25 lb., 20 lb. and A. R. O. daughters. He will be bred annually in our herd to over 150 females, which now include six 30 lb. cows, with a lot more yet to come; twenty-five 25 lb. cows, and over a dozen 20 lb. two-year-olds, which will give him the greatest opportunity of any bull in the West. Keep your eye on "It."

FOR SALE

Owing to the fact that we intend to use "It" and his half brother, King Segis De Kol Korndyke, exclusively upon our whole herd, we are offering at half their real worth our other two herd sires, both of whom are just past two years of age, are nicely marked and are splendid individuals. King Korndyke Sadie Vale 27th, who is the only son ready for service of his noted sire that is for sale. His three nearest dams average over 33 lbs. butter for 7 days and his six nearest dams average almost 32 lbs. of butter, which averages are unexcelled by any other bull in the West. King Winnie, whose dam, Winnie Korndyke Cornucopia De Kol, holds the world's milk record for ten months by over 450 lbs., and who is the only cow to make over 31,000 lbs. milk and 1,200 lbs. butter in a year.

THE PACIFIC RURAL PRESS

SAN FRANCISCO

MAY 19, 1917.

LOS ANGELES

Labor Questions California Farming is Up Against

[Written for Pacific Rural Press.]

ABOUT a hundred persons assembled in Sacramento, May 11. These persons may be roughly classed in thirds, viz.: farmers, near-farmers and non-farmers. They answered a call of the California Farmers' Protective League, and they all found out, at the end of five hours of hard talking, that what California farmers really need is protection against their own greed, inhumanity and impolicy and that they will be immediately furnished such protection by the patriotic politicians, social philosophers and sanitary policemen of the State—but of all that we may say what we think on another page. In this place we desire to state a few prominent declarations made at the meetings, but unfortunately we cannot do that with full justice to the speakers nor their speakings, because they surely talked the fill of this issue of our journal before they tired each other out. Still we may be able to state enough to show the imaginative reader the swing of the discussions. —

ORIENTALS SOMETIMES NECESSARY.

What was well designed to be the keynote of the occasion was struck by Chairman G. W. Pierce in these words:

"The farmer has come to be the most important factor in the present struggle, and the labor question has become an acute problem. If the government could raise forces of farm hands to go from state to state when and where most needed, it would afford relief. The Oriental exclusion act and literacy test for aliens are good pieces of legislation, but are responsible for a good portion of the shortage in farm help.

"A man with good muscle and an average amount of common sense will make an efficient farm hand. The factories, the railroads and the cities pay better and afford more comfortable living, and are strong competitors with the farm for labor. Now the call for volunteers to serve in the armies and navies have taken more. 'The Man with the Hoe' has been immortalized, and now the hoe is manless. Orientals are not desirable, and under ordinary conditions we would not want them among us, but there are times when it becomes necessary to have them."

OFFICIAL EYES SEE NO LABOR SHORTAGE.

Probably not by concerted action but rather by community of political interests and perhaps through wholesome fear of organized, non-agricul-

tural influence which all political patriots seem to be born with, all the official speakers, who were invited to help the farmers solve their distressing difficulties, agreed to reach solution by denial of their existence or, if they do exist, it is the farmer's own fault. L. C. Owens, assistant secretary of the State Council for Defense, read a report in which he claimed that there was no shortage of help in the Sacramento district. Plenty of cherry pickers had been supplied and there were plenty of men willing to work on the farms if living conditions were better. He said in many places

there were no bunk houses at all and men had to burrow into haystacks to sleep. One man slept in a piano box in a cow shed and not a too sweet smelling cow shed at that. Mr. Owens said that the man who offered \$1.50 per day and took the man in and treated him like the family got all the help he wanted, while the man who paid \$2.50 and provided poor accommodations for his men got no one. Speaking more broadly, Mr. Owens said there were men available if living conditions were changed. He ended the report by saying that there is no real shortage of labor and if handled properly there will be none. It all depends on the way the men are treated. If the farmers will co-operate with the State, the farm labor problem will be no problem at all.

F. E. Stahl, in charge of the State's free employment bureau, corroborated Mr. Owen's report and said that good food and comfortable quarters would help solve the problem. He did not seem to be quite so sure as Mr. Owens that there was no problem, however.

MORE LABOR OF THE RIGHT KIND A FUNDAMENTAL NEED.

By this time the swish and gurgle of the stream of official eloquence had well nigh drowned the keynote of Chairman Pierce, that, undesirable as it may be

for certain reasons, "there are times when it becomes necessary to have Orientals." But there were some sharp echoes of the claim. E. L. Shelly of Grand Island spoke from long experience in growing delta products of all kinds. He held that the claims of ill treatment of white laborers are grossly exaggerated, but chiefly maintained that such white labor as could be had, except in a few instances of thoroughly good men, as teamsters, etc., was both unwilling and unfit and could not be depended upon. Instead of being abused, if you even look cross-eyed at them they will leave.

(Continued on page 621.)

TWO CALIFORNIA FARMING LANDSCAPES: WHICH?

At the Sacramento meeting officials said if farmers could not find white labor suited to great specialties they should revise their farming so the family and the old-fashioned, hired man could handle it. The pictures suggest the contrast involved in this proposition.

EDITORIALS

THE FARMER'S VOICE IS HUSHED.

JUST at the moment, it is not the thing itself so much as the manner of its coming off which makes us mad. Exclusion of the most serviceable of the Orientals for farming uses nearly forty years ago was afterwards admitted by the great apostle of it, Denis Kearney of the Sand Lots, to have been a mistake. This admission was made because absolute exclusion was an extreme measure, taking no thought of consequences. Toward the end of his life Mr. Kearney saw that what he had done in his haste was wrong: that his purposes could have been much better served by a limited, selective exclusion: that he need not have interfered with the farmers' use of such Chinese as their enterprises required: that he need not have discriminated against the agriculturally best of the Asiatics—thus opening the doors to others who have proved less trustworthy and more aggressive: that he need not have taken the ground that California farmers were so stupid as not to know what was good for them. It was the claim of those farmers of forty years ago that they could not stay on the land unless they had a loyal, efficient and contented labor supply, but their voice was hushed beneath the clamor of race prejudice, demagoguery and political ambitions. It was a triumph of an extreme recourse and therefore no insight of moderation and conservatism could withstand it. But the farmers' claim that they could not stay on the land without the labor they needed has been proven true. The older owners and developers have been retiring from the land, instead of ripening their years in comfort amid the scenes of their earlier enterprise. For forty years, and to this day in increasing numbers, the white-race pioneers and their descendants have disappeared from communities which they established and built up. The white-race prejudice of the Sand Lots has wrought for two scores of years to the prejudice of the white race on the farms. Denis Kearney was right when he admitted that his crusade was too extreme and thoughtless and brought consequences which are natural to unthinking radicalism.

PUTTING OVER A NEW HUSH.

BUT the exclusion of foreign labor supply is the thing which does not excite us at this moment. It is rather the manner of it, which recalls the extreme insistence of the Sand Lots, which awakens us to protest. We have tried to give on other pages a sketch of what was called to be a farmers' assembly in Sacramento on Friday of last week. The reader will perceive that as a representative farmers' assembly, both numerically and geographically, it fell short. He also will perceive that as an outspeaking of non-farming beliefs, policies and interests it was over-rich. The idea of such a meeting, as it was cherished by its farming proponents, was good: the working out of it was exactly contrary to its conceived purpose.

The idea was this: farmers are called upon by

a national emergency to increase production: farmers are ready with patriotic spirit, with lands and outfit and with such money as they have or can get, to make a supreme effort for maximum output of foods—but such a thing cannot be done without adequate labor of the right kind. Farmers have now no such supply: it is but right that those in authority should know this and should help farmers to secure this essential factor of production.

The outcome of the meeting was, as shown in the sketch on other pages, that insufficiency of visible labor was denied: that farmers could not get the labor they needed because they would not treat it properly: that if the work for special products which world-trade calls for is too hard or disagreeable for such labor as is claimed to be abundant, such products should be abandoned: that farms should be planned and operated, not to bring in millions in cash for the upbuilding of the State, but as lodging and boarding places for the farmers' helpers, and if, after serving this purpose for humanity, the farm could sell enough left-overs to get cash for taxes, the farmer would be a great patriot—a good, stout pillar in the basement of the commonwealth!

And this view, voiced by state and national authorities in goodly number, prevailed. A great hush fell upon an assembly called by farmers to ascertain what farmers could do to discharge their full, patriotic duty!

HOW THE MUFFLER WAS PUT ON.

NOW WE wish it clearly understood that the official representatives of authoritative patriotism who so politely suggested that the farmers should go way back and recline upon their idea that new sources of farm labor must be drawn upon, did not behave themselves unseemly nor did they of their own volition intrude their views upon the assembly. They were invited by the organizers of the meeting and it was perfectly right for them to express their convictions: it would have been wrong for them to do otherwise. Therefore, we offer them no affront nor did the assembly do so. If the farmers smiled at the diagnosis of farming conditions and prescriptions for farming cures which these officials presented, they did it in their sleeves—for they felt the great hush which these speakers almost unconsciously brought down from above or up from below, as the reader may for himself conclude. What excites us is not what came but the manner of its coming. Last week's meeting was only a new and somewhat unique exemplification of what we are getting, quite cross about, and that is that when an intrinsically important agricultural fact or requirement appears, or when an issue arises in which the farmer is a fundamental factor, neither the farmer himself nor those chosen by him to represent his social or industrial point of view are expected to have any weight or influence in determining what is to be the adjustment of the matter to the farmer himself, to his God or to his fellow man. Take, for instance, this present question of the farmers' ability to meet the emergency in food production. There is nothing clearer or surer than the fact that there is no adequate supply of suitable farm labor. It is not peculiar to California: it pervades this country: it occupies many civilized nations. It is not new: it existed before the war and it has handicapped farming progress here and abroad. It is now more acute than formerly and it absolutely determines the amount of foods which can be grown, even if all other things are favorable to maximum production. Now, why is it denied outright or met with interrogative denials accompanied by declaration of vain substitutes for the qualified, competent and ever-ready help which the producing farmer knows he must have? Why do those in authority scout the farmer as a qualified expositor of his own business needs? It is simply because he has no organized advocacy of his needs and desires. Therefore, when the California farmers declare they must have help from outside which will do work and not boss the farm, what happens? Just what happened last week. As soon as the first note was sounded that help must come from the outside, the political muffler was put on, all the way from Washington to Sacramento, and, lest any pulsing

of the farm motor should be heard, the hurdy-gurdy of political employees was set to playing—

So long, Mary: Mary, we will miss you so!
So long, Mary: How we hate to have you go!

POLITICS AND FARMING.

"BUT," says some innocent reader, "how can you suggest that politically Washington and Sacramento are in the same drive against the farmers' idea of the help he needs? Are there not different parties in control in Washington and at Sacramento?" Of course they are different and still the same: parties are different, politics are one and inseparable. Politics are the only universal, all-pervading science. And so it is that we find all employees of parties, which are strong enough to have any, worship the same forces in the electorate and are by their very nature compelled to do so: and, naturally also, all the employees of all such parties pour out libations of selective philanthropy or wave the yellow-peril offering or light the fires under alleged immorality, to propitiate their political gods, whenever the farmers even whisper that they must have capable and willing labor or their production must decrease. The manner in which such a proposition is received when an organized force is pitted against unorganized convictions and claims is illustrated by the fate of the Sacramento meeting which was called to voice an agricultural claim and belief and really voiced nothing of the sort. In the nature of things the meeting as it was constituted could not do otherwise.

As stated at the beginning, it was not the thing itself but the manner of it which excites us. It is clear enough that no labor supply from the outside, even from our own insular possessions, can be admitted. We are neither approving or condemning this fact, nor do we invite any reader to send us his views on that subject. We have no space for discussion of what seems to us a dead issue. The question of how it died is, however, alive and should be understood. In one of the daily papers there was last week a brief interview with a representative of organized labor. This representative was asked what the labor unions had done about the farmers' appeal for imported labor and he said no action had been taken up to that time, but the labor unions would unanimously oppose it. It was a frank, clear, confident statement from a man who knew the forces he was representing. And not only did he know it, but all the politicians knew it and all the people of average intelligence knew it. We even knew it ourselves and we respect and admire it because it comes from men who have the strength of their convictions about what their interests are. We are not excited about what the labor unions do, when they act within their human rights and whenever they go beyond such rights they are perhaps not so much to blame as we are for making it possible. However, some of its purposes and methods may deserve condemnation and punishment, labor organization as a whole is a magnificent demonstration of what has to be done to get recognition for vocational points of view and service to vocational interests. In the light of their achievements it is very easy to see that farmers, unless they organize widely and effectively, will never get even respectful consideration for their needs and convictions. And so long as they send a minority to represent them at a meeting called to make these needs and convictions known, they will get from the politicians, and from people generally, just the same funeral hymn which the official hurdy-gurdy played for them at Sacramento—"So long, Mary."

SUBSTITUTES FOR FARM LABOR.

AND NOW we are promised by those in authority that they will make good their claims that enough farm labor can be gathered from the State itself. We hope they can make such a demonstration, for that seems to be really about all the hope there is, and farmers will make the fullest use of whatever supply the officials may discover, providing it is energetic, well-behaved and willing to take orders. We must, however, record a protest and a warning against filling the rural communities with peace breakers for whom the country has no adequate repressive machinery.

ery and against whom it has no adequate protection. The following appears in one of the daily papers of this city:

San Francisco police judges and district attorney believe that it would be possible to send at least forty men a day from the four departments of the Police Court to aid the farmers. The persons are those whose besetting sin is liquor, and who are not natural criminals. The judges are convinced that there is a chance for at least 90 per cent of them to "come back" in proper environment and through correct living. The plan is to keep a register of help wanted and where, and to give the calendar of the court each morning a thorough combing, select the best material, send them to the country with fare paid and at a living wage, and give them a chance to redeem themselves and be ready for drafting into the army after a six months' or a twelve months' session on farms.

Of course, we have no hard words for these unfortunates, but the city people should be made to understand that it is just such persons that no busy farmer can possibly afford to have on his

place—no matter how philanthropic he might be at heart. Men who are gone far enough to require a half or a full year's reformation must be pretty near the genus "bum." Such men are physically unfit for farm work—without mentioning other disqualifications. As laws now are, a farmer employing such a man might lose his horses or break down his machinery and have also to pay damages to the unfit man who was hurt in the losses he occasioned by his own unfitness. If it were not so serious it would be funny to read the charges against farmers which the speakers at Sacramento made of ill-provision for white laborers and then read the provisions which the San Francisco philanthropists are making to send them a white labor supply! Really, city people, politicians and philanthropists, would it not be better to let the farmer attend to his own business? He is not organized to demand it, but would it not be possible for you to do more of your own work and less farming of the farmers?

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Root Knots on Old Trees.

To the Editor: Have trouble with some of my peach trees. A knot forms on the root near the trunk under the ground, and it looks like dried cork. I cannot find any cause for it. Please can you tell me?—J. M., Monterey.

The excrescence or knot is caused by a fungus which has secured entrance to the tissue. If it has not spread over so much surface that removing it would girdle the tree and destroy what is now good bark, you can chisel off the knot and cover the wound with Bordeaux paste. If doing this would practically bark the tree, let it alone and keep the tree as long as profitable and then plant another in a new place. It is, of course, always desirable to have new orchard coming on, if you have the land for it.

One of the Grape Vine Hoplias.

To the Editor: Can you tell me what the enclosed insects are, and what to do to get rid of them or prevent them from coming next year? They arrive by the thousands as soon as it's warm in the spring and eat all my roses and most of the other flowers, and now they are beginning on the grape vines, both leaves and buds.—R. L. S., Porterville.

The insects are beetles of the chafer group and their proper name is *Hoplia pubicollis*. They are about a quarter or three-eighths of an inch in the length of their rather blunt bodies, with legs too long for them. They can be recognized by the silvery colofs of their under surfaces. They are an old pest of the vine and took to eating grape buds and foliage as soon as the pioneers began to grow them in the southern districts of the San Joaquin Valley. They are apt to be found quite widely in interior valley and foothill locations. As you have noted, they have a wide range of food plants. They grow underground as grubs on the roots of grasses and weeds on unplowed land—flying from such places to fruit plants and flowers as beetles. They can be killed by spraying the foliage of plants they attack with lead arsenate—2 pounds to 50 gallons of water, or, on a small scale, a tablespoonful to a gallon. This is, of course, poison and must be handled carefully in garden work. The insects can be shaken into a catch-pan of water with a little kerosene, by jarring the plant they infest.

Late Plowing and Fertilizing Apricots.

To the Editor: I have six acres of cots about eight to ten years old. I usually have an average crop in size and quantity. I plant peas for cover crop and pick from \$75 to \$100 worth of peas from the vines, but by doing so I delay the plowing about three weeks. I keep orchard well watered. I want to know if this delay in plowing (which will delay this year until May 24) is any disadvantage to my fruit, and if so to what extent. Also is it too late in the season to use nitrate of soda and superphosphate? What will it cost and where is the cheapest place to get it?—C. A. L., Hemet.

The late working will not hurt the crop if you

keep the moisture right. An irrigation before plowing in the litter of the pea crop would serve the trees and help decompose the litter. One would think the pea roots, etc., would give you nitrogen enough, but a little nitrate might help because immediately available. One hundred pounds of nitrate and 400 of superphosphate would be a good proportion. These are standard simple articles and prices will not vary much between reputable dealers. As they are soluble, it is not too late to use them in connection with irrigation.

Irrigating Beans.

To the Editor: If but one irrigation is to be given pink and small white beans, at what period of growth may same be best applied? I should assume the best time would be just before the blossoms appear, in order to induce the plant to supply further space for more blossoms, but perhaps the assumption is incorrect.—R. H. R., Lake-side.

Your guess is a good one—unless the plants come to bloom with notably good vigor and show signs of ample soil moisture. In that case we would irrigate after pods are set. If, however, early blossoms blast, as is the case in many hot interior places, the plants may need water during such a long blooming period to keep the plant strong enough to keep on trying for a set of pods. Irrigating beans depends upon the location with reference to the presence or absence of aerial moisture: it also depends upon the soil and cultivation in the retention of moisture. There are two things to be guarded against: one is not to allow the plant to perish before it can fill a pod: the other is not to irrigate so much that it is kept on growing too late and setting too many pods without properly maturing any until it is caught in a possible early fall frost or the crop is injured in an early fall rain of some duration. This has to be determined by experience or by reason and judgment: not by schedule.

Fertilizers for Beans.

To the Editor: What is a good commercial fertilizer for a bean crop to get results this year, and how much per acre? Our land shows very little lime and no alkali, but is lacking in humus. What do you think of this superphosphate?—H. L. J., Modesto.

Of course, the fertilizer will not get results, but it will help you to get them. Superphosphate is good, for it gives you both lime and phosphorus, but for dry beans, not counting what the soil may contain, it is best to use a complete fertilizer and a good mixture is the following per acre: Nitrate of soda, 40 pounds; dried blood, 20 pounds; superphosphate, 250 pounds; potash, 80 pounds. Manufacturers may, of course, vary some of these elements of a complete fertilizer, according as materials are now available. The substances must be thoroughly mixed and evenly applied to the whole ground and not bunched around the seed.

Summer Treatment of Beans

To the Editor: I will appreciate it if you can help me in solving the following problem in cultivation: We have a medium heavy soil, located near Ceres. Next month a crop of barley will be taken off, after which we flood thoroughly and plow as soon as possible thereafter. By July 1, after proper preparation, we usually have beans planted—blackeyes, pinks and teparies. We have in the past harrowed the land directly behind the plow and then twice just ahead of the planter. Do you think that rolling at this part of job would increase the bean yield? There are spots that are quite moist and I do not know what effect a roller would have on such places. With the plowing and harrowing and no cultivation between the rows afterward, except hoeing weeds, we have harvested from nine to twelve sacks of beans per acre (100-pound sacks). We have never tried shallow cultivation and none of our neighbors have done so on second crop beans after they were planted. I would like to know if you think it would pay. If it is true that a dust mulch becomes ineffective after ten days or two weeks, I should think it would be beneficial to use the disc cultivator.—E. B. D., Ceres.

If your regular system of getting your bean plants into moist earth with a loose surface and then laying them by for growth secures thrifty plants and good product, you have perhaps less to gain than frequent cultivation would cost. As you say that such is the adopted practice of your section, it creates an impression in favor of the method as being the result of local experience. On the other hand, if the weed-cutting hardens the surface and the middles are seen to be hard and baked, there can be no doubt that better surface tilth would conserve more moisture for the plants and make them more thrifty and productive. You must settle such a question by good thinking on the basis of soil conditions which you see. For loosening in connection with weed-cutting between the rows, light discs working over cutting blades may be pretty near an ideal of a surface-working outfit. Implement makers are, however, securing the same conditions with many different soil stirrers. The roller should not be used on moist soil unless it is very light. The effect of the roller is to compact the surface layer and, by restoring capillarity, bring moisture nearer to the surface. On a light soil this ensures the starting of seed and early growth of plants, which, without rolling, might perish from drying out because the surface is too loose and open. On other soils a better style of compacting or settling is secured with the harrow. Heavier soils, when very dry, may be helped by rolling, but that is not what you ask about.

The statement that a well-pulverized surface layer only acts as a blanket against evaporation for a short time is true if the air at any time of day or night carries considerable invisible moisture, or where visible in dews or fogs. In California such moisture is encountered in coast and mountain valleys and in such cases the soil surface should be frequently stirred, but not turned over. In the great valley, away from the intrusion of coast winds, a surface deeply stirred early in the summer may hold its efficiency as a check upon evaporation for a much longer period. Try it with your hand or foot and if it is dry and loose for several inches—down to where it is taking moisture from the moist, firm layer below—it does not need stirring. But if it is crusty at the surface or two or three inches below, it should be stirred at once and at short intervals afterward, for such disposition to compacting is a menace to moisture conservation and a sign that sun and dry air are robbing the plants.

California Weather Record

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., May 15, 1917:

Stations—	Rainfall Data.		Temperature	
	Past Week.	Seasonal To Date.	Normal To Date.	Max'm. Min'm.
Eureka21	30.74	43.81	60 38

San Luis Obispo	22.54	19.98	66 38
Los Angeles	15.05	15.41	74 50
San Diego10	9.92	9.81	64 54

Well Prepared to Pack Cherries.

[Written for Pacific Rural Press.]

When labor is hard to get and wages are high, a little extra comfort for the help may make the difference between getting help or not. What H. A. Bassford of Solano county has done for his cherry packers could be done perhaps in a less expensive way by any group of cherry growers controlling as much orchard. Mr. Bassford has 5,000 cherry trees, the oldest of them twelve years old, from which he shipped 10,720 boxes last year, netting an average of \$1.50 per box.

Much of this good price is due to the packing, which is done by the day to insure better work. To get the fastest good work possible was the object of building the new packing shed which has been in operation since early May. It is 100 feet by 40, to accommodate also the three carloads of shook and sixteen kegs of nails bought early by Mr. Bassford. On a bench close by is equipment designed on the ranch for speedy construction of boxes. At the other end of the shed are six or seven packing tables, each partitioned off for four packers on each side of center. They are painted with heavy white lead, which enables easy cleaning and is not rough to bruise cherries. Cloth used as a padding in past years got dirty and wore out too easily. An inclined rack for each packer holds the box at 45 de-

grees and permits packing full from one end to the other, as we saw packers doing. Rubber mats for various sized cherries space them in the top of the box, which must later be loosened to remove the mats. A shelf lengthwise over the center of each table receives the filled boxes, and a shelf above that holds a supply of empties. At convenience the filled boxes are moved to the nailing bench in the center. This bench is covered with zinc to prevent getting slivers in the nailers' hands. The covered boxes are stacked on the floor beside the sliding doors, whence they are loaded into wagons whose beds are about level with the floor.

A ventilator in each end of the shed and forty-two hinged windows admit breezes. Glass windows above most of the ventilator windows make the shed light. The yard is sprinkled almost daily to prevent dust.

On May 7 we saw in this shed some nine-row nested Tartarians and ten-row solid Spauldings, extra large for this season. The latter is a white-pink variety originated on the "Ulati Ranch," as Mr. Bassford calls his home. Other varieties follow these and the Chapmans in such succession that the picking, packing and shipping are distributed evenly through six weeks.

Thins Peaches From a Wagon.

[Written for Pacific Rural Press.]

One man can thin as many fruit trees standing on a wagon as two can with ladders, said H. J. Vosberg of Yolo county when we found him walking around on a tight hay rack thinning half of a fifteen-year peach tree at every stop. "I'd pay a dollar a day for a team if necessary rather than use ladders." He could have kept two men busy on a wagon, and could have fixed a similar platform on a one-horse wagon if required.

Peaches should be thinned before the pits begin to harden, which would be after the middle of May this year in the Winters district. Pits contain more of soil plant food than the rest of the fruit, and this waste should be avoided. Too early thinning, however, might be succeeded by unfavorable weather and great loss of those left.

You thin differently when some limbs have a light crop as was caused on one side of the trees in Mr. Vosberg's orchard by frost. The tree can support a given number, and if the right proportion are not left on some limbs others may be left with heavier loads. Second-size peaches were not picked off because they would fall anyway, having been frosted, as shown by their brown pits. Since these were Lovells and Muirs for drying, less care was taken about spacing than for cannery peaches,

where size is a prime requirement. Still, where convenient, the peaches would be left in a whorl around their twigs, to take advantage of all the space there is, since a third to a half more were being left than would if the whole tree had been uniformly loaded. A twig a foot long would normally mature four peaches. No other attention was paid to location of reserved fruits either on upper sides or far from the bases. Where relative location of two peaches was equally desirable, the smaller one was sacrificed. Double peaches are not so objectionable for drying, though at least one of a double is likely to fall, and singles are preferred, if there. Muirs have more doubles than Lovells.

Where the fruit is pretty thick, considerable care is desirable to avoid loosening those that remain. It is even necessary to hold them safely sometimes while pulling off their mates. This is especially needed on the Muirs, which cluster more than Lovells.

Where fruit trees do not shade the ground too much crops of potatoes, beans and various kinds of corn may be grown between the rows, thus getting an income from the land while waiting for the trees to come into full bearing.

Fruit Tree Plant-Lice

Watch the fruit trees; and when plant-lice are found on the growing tips, drench them with spray under high pressure. Repeat a week or two later. If you let them get bad before spraying, they will do a lot of damage; and will also be better protected in many cases by curled leaves. Blackleaf 40, one part per 1,000 of water, with a few pounds of soap added, is effective and safe. Distillate emulsion, used strictly according to directions, is effective. It is dangerous if too strong. Blackleaf 40 added to this in above proportions makes it more sure. But spraying does no good unless it hits every louse to be killed.

THE American Beauty Dust Sprayer

GUARD YOUR GARDEN

SAVE YOUR FRUIT
Red spider and mite, mildew, rust, and insects are at work on vines and trees. Dust now, before they get a start. Dust sprays are better than liquids, are cheaper and more easily and quickly applied. Serve your country by protecting your crops.

GARDEN PESTS
Bean and pea mildew; rust, red spider, bugs and worms on truck and field crops—kill them all with dry insecticides.
"A puff in time saves the vine."
The American Beauty is the fastest and easiest working knapsack duster. Throws a perfect cloud—no lumps, no clogging. Uses least dust—does most work. Ask your dealer for it. Or send us \$11.00 for vineyard and garden size, \$13.50 for orchard size. We ship all charges paid. Refund if not pleased after week's trial.

WE FULLY GUARANTEE EVERY MACHINE.

Here and There in the Fruit Business

Humus Fundamental in Orange Production.

[Written for Pacific Rural Press.]
The great proposition that confronts the citrus grower at the present time is to get humus making material and organic fertilizer at a reasonable cost.

The experience of Chas. D. Baker, an eastern Los Angeles county orange grower, has been that unless there is plenty of humus and mulch in the soil the benefit of commercial fertilizers to a great degree is lost and results are not obtained in building up and retaining good producing groves for any long period of years.

In the fall of 1915 Mr. Baker applied two tons of alfalfa hay to the acre and disked it in, following in the spring with six pounds of blood and five pounds of superphosphate to the tree.

This season he has on one ten-acre grove an 8,000-box crop of oranges. He does not claim all results in the fertilizer alone, but by careful pruning, fumigating in the fall and spraying in the early spring has brought good results.

Sucker Apricots Now.

[Written for Pacific Rural Press.]
"Sucker apricots now," say H. G. Boyce and H. J. Vosberg of the Winters district. Mr. Boyce puts his men to this work so soon as they can be spared from fruit thinning, and believes that no suckers start after the

middle of May. Mr. Vosberg wants to sucker while the pits are hardening, which is a little later, to be sure few other suckers start. He mentions leaving suckers (watersprouts) on the upper sides of limbs, except where fruit wood already shades them. One man lost his next year's crop by cleaning off all sprouts and thus exposing the limbs to sunburn so they did not develop fruit buds. In the Winters district the general plan of pruning has been to run the main limbs out horizontally a little above a man's head, so they are thoroughly exposed to the sun if all growth is cut off. Unless suckers are taken out from among fruit wood, they will both rob and smother the latter to death.

Thinks Mulch Basins Will Be Plowed Up.

On account of devil grass in the Corona district, M. E. G. Tuthill, Deputy Horticultural Commissioner, thinks that people will be forced to plow up most of their mulch basins in citrus orchards. He also believes that with the same amount of fertilizers as is put in the mulch basins the trees would do equally as good if fertilized under the old plow system. The majority of citrus growers in and around Corona seem to talk against the mulch basin system, and with hardly an exception point out the Chase Bros. orchard (now in mulch three years) as a poor example of mulch system.

Labor Questions in California Farming.

(Continued from first page.)

The delta farmer has to have Oriental labor. It is not a question of wages. The farmer pays the Oriental high wages because the Orientals deliver something for their pay, no matter what their wages are. If the great special products which are making California famous are not to be abandoned, farmers must have labor they can use to make them come through.

Arthur M. Seymour followed by saying, "There is a definite need in the delta section and we think we have a definite remedy. This condition has not been brought about by war but has been growing for the past ten or twelve years. The white man will not perform a lot of work and we are forced to depend entirely on the Oriental. If we are to continue in this specialized farming such as California is doing, we have got to have labor and we have got to have Oriental labor. We ask assistance. We can keep up production if the Council of Defense will put into operation arrangements whereby this Oriental labor will be furnished.

G. W. Kesner invited the Council for Defense to go to his ranch and see conditions. The Jap and the Hindu have clean bedding and make for themselves clean quarters and take a bath every night, while the white man hasn't even a roll of blankets, and if he takes a bath once in two weeks he does well.

THE U. S. IMMIGRATION OFFICIALS WILL CO-OPERATE.

Interesting telegrams were read from Mr. Caminetti, U. S. Commissioner of Immigration, and help was promised by his local representative,

Captain White, in the way of help to ascertain what the labor supply and where the need. A very charming speech was also made by Mrs. Barfield, also of the Immigration office, which caused even her suggestion that if our farming cannot be done with white labor we ought to change our kind of farming to suit such labor, to be received indulgently by her hearers.

Judge Shields also made an impressive address upholding the necessity of preserving California for the homes and industries of white men. Several resolutions were presented and referred to a committee to be named by the chairman who should go on with the work which the convention was intended to pursue.

A very important statement was made by D. F. Lane of Turlock showing how the local association of growers is proceeding toward securing its needed labor supply and keep it well housed for local distribution co-operatively in the Turlock region.

OFFICIAL HELP PROMISED.

Since the meeting of May 11, and said to be a product thereof, the announcement is made that the State Council of Defense is formulating plans for co-operation of Federal, State and municipal employment bureaus in California in meeting the farm labor problem. A labor survey by the Council of Defense is under way and an effort will be made to secure reduced railroad fares to aid in the movement of workers from place to place, as needed.

Fumigating Tents

Full weight, specially woven material. Size of tents guaranteed. Workmanship of the best, and marking correct in every detail.

WE INTRODUCED FUMIGATING TENTS IN THE UNITED STATES, AUSTRALIA AND THE ORIENT, AND OUR YEARS OF EXPERIENCE IS AT THE DISPOSAL OF OUR PATRONS.

FRUIT PICKING BAGS

We manufacture the Wilson, Pacific, Covina, Hoegee Dashboard and Woodward Bags, covered by U. S. Patents—the only Practical Fruit Picking Bags on the Market.

Boost Your Citrus Trees Now

The grade of fertilizers determines the grade of Citrus Fruits. Chilean Nitrate has one hundred per cent of its Nitrogen Nitrated, and is ready to go into action the instant it is applied. It brings quicker, surer results than all others because they have to be Nitrated

first. Why not buy your farm munitions ready for use, not subject to losses which the other Nitrogens always suffer? Common sense dictates that money is saved by its use. Its low price compared to others strongly commends it to the business grower.

Sugar-Beet Growing at Corona

[Written for Pacific Rural Press by Chas. Barnum, Corona.]

Observations at this point show that beets, to do their best, should be sowed about February 1, 18 inches apart and two furrows between, with a drill, and 18 pounds to the acre. About the latter end of April they should be thinned out to one beet every 10 inches. Let beets go as long as possible the first time without irrigating, to avoid packing the ground and spoiling the original loamy condition of the soil. About May 1 comes the first irrigation, which should be repeated once a month till three irrigations are given, the last one not later than July 15. Cultivate after each irrigation, except the last one, because the beets are then too large and would be more injured than benefited thereby.

Plowing, planting, three irrigations, two cultivations and weed-hoeing twice, digging and hauling to the dump, consists of beet raising here at Corona. I know of good old alfalfa land here that grew nineteen tons per acre last year, while some hillside land not far off netted only four tons.

Plowing, drilling, cultivating, digging, and hauling to the dump, costs about \$28 per acre, while thinning costs from \$4 to \$4.50 per acre. Six men can thin twenty acres a day. Two hoeings cost about \$3 per acre. This makes a total cost of about \$35 per acre for raising them. Good beets should run 18 to 20 per cent sugar. Last year 20 per cent beets paid \$6, while 15 per cent beets paid \$4.50.

This year the American Sugar Co. has already announced a \$2 advance per ton on account of higher prices of sugar, and the cost of labor involved in growing the beets. Mexican labor has been used here in the past mostly.

LISTING GRAIN IN DRY SOIL.

High-priced grain has caused much land in San Joaquin county to be plowed rather later than it should have been this year, with the hope of raising a summer crop instead of letting the land lie idle. Heavy north winds have dried the sandy soil out badly in the past two weeks and because of this many who are sowing sorghums are listing it in. This gets the seed down to moist soil, where it can germinate, and is probably the only way a crop could be secured on the land this year, where irrigation water is not available or where the land has never been leveled and checked.

LOCATING WATER.

To the Editor: Is there any geological explanation for the use of a willow reed in locating a well?—J. F. C., Santa Rosa.

None at all. Entirely psychological and often successful due to the underground streams which are to be found most anywhere if you go deep enough.

Solid as the turnip roots appear, they contain on an average about 89 per cent of water, or a trifle more than is found in whole milk.

CRITICS' AND CUDDLERS' CORNER

Subscribers are welcome to praise or to condemn (in letters of not over 200 words) anything which appears in the reading columns of this journal. Contributors to this department may drive and counter-attack each other as they see fit without endorsement or response on our part.—Editors.

Poultry Graft?

To the Editor: Am I not right in saying the State experiment stations are kept up by combined State and National funds and we all should have access to the benefits and we all pay the people who give the time.

I notice mention of the Storrs, Conn., world's experiment and writing them; get full and complete information.

I notice in your paper mention of the Missouri station and have frequently written. What do you suppose we get—advertisements of a personal correspondence school they have, by which we can pay quite a nice sum and get two years' correspondence course. The general manager of the station is the president of the correspondence school. I wrote several times and then got others to write, for over a year. Not a single word regarding the world's experiment, but lots of "boom" of the great correspondence school. Is this right? Is it graft? Do they take advantage of public office, for which they must draw big salaries, to get the addresses of those to use for their private gain and use the time we pay for to conduct their own business?—Wm. Starbuck, Fullerton.

A German in Paradise.

To the Editor: In your appreciated paper, the Rural Press, you hit the nail right on the head with your editorial, "Patriotism, Paternalism, etc." It is just now best to look at things in a humorous, philosophical way. My father used to say often: "Mit wie wenig verstand die welt regiert wird, wir sehen nur so oft."

[Only too often do we see with how little common sense the world is ruled.—Editor.]

We have a very rapidly progressing fruit district on this ridge. We have now installed our own water system for irrigation, covering 10,000 acres. I would like to make record of the fact in your paper.—Hermann Heinke, Paradise, Butte County.

Thinks Kaiser Has Claws.

To the Editor: Allow me to suggest to the one who wrote the article entitled "Cream for the Kaiser" in the issue of April 28, that this fair United States is no place for such an one. All such should be sent back to where their heart is, just as quick as steam can take them. Great peace lord—bah—anyone with one sense of justice knows better. Why try to cover the cruel claws with velvet under the guise of truth? I am a lover of truth—real truth—not so-called. Such a statement is next to high treason and ought to be dealt with accordingly. He ought not be left to enjoy the liberty and privileges of this grand U. S. A.—Placer County Lover of Truth and Justice.

South African Oranges Paid.

To the Editor: I always peruse your paper with much interest and profit. But I do not agree with your views published late in January as to the chances and prospects of citrus growing in South Africa. It gets something more than the "pip" as he prophesied. The growers here last year realized up to 35 shillings per case for Navels in London. If you can beat that in California, good luck to you! Herewith money order for nine shillings, which I trust will be sufficient at the present rate of exchange to pay for two years' subscription.—Richard Rusk, Transvaal, South Africa.

Professor B. A. Madson of the University of California College of Agriculture, has written a bulletin on "Grain Sorghums," which imparts all

the information necessary to successful growing of stock feed in the campaign of agricultural preparedness now being waged.

We are facing a world wide food shortage. For the sake of the hungry world as well as for the good of your bank account you ought to make every foot of your land produce its utmost. You can't possibly do this without fertilizing. Germany's crop failures for the past two years have been largely due to her inability to secure proper fertilizer materials.

GOLD BEAR FERTILIZERS

Are made from Animal products that contain the elements necessary to meet California soil conditions and crop requirements.

Wide Spreading Pays Best

WHEN you have looked them all over; you will probably decide to buy a wide spreading Low Cloverleaf, Low Corn King or Low 20th Century manure spreader. These machines break the manure up into very fine pieces and spread it evenly. They spread beyond the tracks of the rear wheels. The width of the spread is adjustable. Manure goes further and does the soil more good when spread with a Low Cloverleaf, Low Corn King or Low 20th Century machine.

These wide spreading machines with load leveler are by long odds the most popular spreaders ever brought out. We find that the better work our spreaders do the more we sell. Join the crowd and buy a Low Cloverleaf, Low Corn King or Low 20th Century.

If you will drop us a line, we will send you complete information and also tell you where you can see these machines.

Vegetable and Field Crops.

[Written for Pacific Rural Press.]

Gets Early Tomato Blossoms.

Chalks Early Jewel tomatoes transplanted a week ago by J. W. Davies of Glenn county are making blossoms now, due to Mr. Davies' previous treatment. They are vigorous and thrifty, while plants treated in the ordinary way are still struggling to put out new growth, having been set back in the transplanting. When the plants have four leaves they are transplanted to pots or to a box, four inches apart, and watered until they start to grow. From that time until transplanting to the field, they are never watered until they wilt. The tops do not grow much, but the roots develop splendid masses of feeders due to the struggle for moisture. Meanwhile the plants are setting buds. When the buds show, a small furrow is made in the field, water run through it, and the plants set in the mud, which is then covered with dry dirt. The plants never wilt, and it is three weeks before they need water.

Setting tomatoes in dry dirt and then soaking the ground has a very injurious effect on the plants, as observed by Mr. Davies.

Fast Tomato Planting.

On a ten-acre field in Solano county three men were planting tomatoes early in May, as fast as the horses could walk. Similar machines are used for sweet potato, cabbage and other plants. A middle-break plow is fastened between two wheels at the end of a wagon tongue. Following this is a knife between two four-foot wheels, which digs deep in the ground and is flared into two blades behind, to leave an opening for the plants. A barrel above the middle-break supplies water through a hose to this opening. One man drives, two men ride seats close to the ground so they can take the tomato plants from platforms in front of them and place them in the freshly moistened opening as the machine travels. Two curved knives follow the cutter knife to rake the dirt tight up to the plant. These tomatoes were being set about five feet apart each way and about six inches deep. They promptly wilted in the noonday sun, but recovered the first night.

Hauling Rather Than Dragging a Harrow.

Instead of dragging heavy three and four-sectioned harrows along the ground from implement shed to field or loading them on a wagon to transport them, we have found a sled very convenient this season. The one we have used is 12 feet long, 4 feet wide and about 6 inches from the ground. This accommodates three sections. When we want to load the harrow on the sled we drive the latter alongside the harrow and in this position one man can load with ease by turning each section completely over onto the sled. One man can unload it in the same way without heavy lifting.—J. C. L.

Don't Plant Beans Too Early.

Many inquiries are being made by farmers new to the bean growing business as to best time to plant.

In the upper San Joaquin Valley districts older growers generally advise late plantings for reds, pinks, kidneys, Lady Washingtons and "navies," some even planting as late as July 10 last year, with good success. May plantings are claimed to be more subject to weevil trouble and this year some of the early planted beans are already bothered with aphids. In our own planting we expect to plant about June 10, insuring moisture and a good seed bed by frequent harrowings and irrigation on those places which are already pretty dry. A neighbor advises the use of a Cyclone weed cutter for several weeks before planting, as he has found it keeps the young weeds cut down that sprout after plowing and at the same time leaves a good mulch on the surface.—

Clever Garden Irrigation.

Vegetables fresh from the ranch garden are so much better than what you buy that H. A. Bassford's son keeps up a garden about fifty feet square on their ranch in Vaca Valley, doing most of the work evenings.

The garden is fenced to keep chickens out. About every ten feet a wire is stretched across it five or six feet above ground. The garden hose is hung to one of these wires from near one end to the other by short wires bent into hooked ends to slide on the long wire and to hold the hose. On the end of the hose is a rotary sprinkler. When it has thoroughly wet the ground at the far end of the wire the hose is pulled endwise, sliding its hooks along the suspended wire, until it sprinkles a new place.

BUTTE COUNTY AGRICULTURAL EXPOSITION.

Last year's spring exposition at Chico startled some folks. For this year 50 per cent greater floor space had been sold ten days before the exposition shall have opened, May 21. Even Los Angeles promises a delegation of 150, and half a dozen county exhibits are arranged. More livestock has been entered. The tents are mostly up a week ahead of time. Livestock judges, Prof. Gordon H. True and Prof. J. I. Thompson, will place ribbons Monday, Tuesday and Wednesday afternoons out under the trees. U. S. Meat Inspector Fred Miller will give a carcass-cutting demonstration May 23 at 2:30 p. m. The Holstein-Friesian Association will meet that day in the city hall. Dr. Cady will demonstrate hog cholera vaccination. The livestock parade will occur Thursday at 10 a. m. The California Sales and Pedigree Company will auction twenty purebred Holstein bulls after the parade. On Friday will be held a consignment auction sale of all kinds of farm and pet stock under supervision of the exposition, and under the management of S. F. Williams. At 2:30 p. m. milk maids of Northern California under 20 years of age will contest for dresses, hats, etc., to the value of \$35.

About 3,500 square feet will be devoted to farm machinery, including tractor exhibits of the Yuba, Samson, Best, Bear, and Purpose machines.

Poultry has its special building and C. J. Hinds will be the judge.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

POWER-RUN PASTEURIZING PLANT AND DAIRY HOUSE.

[Written for Pacific Rural Press.]

Pasteurizing and purebred Jersey bulls enable C. R. Merrill, of the Jersey Farm Dairy in Colusa county, to sell his milk locally at 50 cents per quart per month more than his competitor. Mr. Merrill has three full strings of cows, 90 to 100, sells 100 gallons of milk and perhaps a dozen gallons of cream per day in Colusa. The surplus cream is made into butter under the Merrill brand, and all of it is sold locally.

The pasteurizing plant is run by electricity. One motor runs a line shaft, which runs the separator, clarifier, pasteurizer coil, churn and bottle washer. Another runs the compressor and small centrifugal pump for the ice-making outfit, which has capacity of a ton per day. Water to wash utensils and bottles, and to run through the pasteurizer coil, is heated with steam from a six horse-power boiler in a separate room of the dairy house. Steam sterilizes milk containers, also. The crude distillate or "stove oil" used in this boiler costs about \$35 a month, according to Mr. Merrill; while electricity for the ice machinery costs \$25 to \$30 per month. The ice outfit is used to cool brine, which brings both milk and cream down to freezing point after pasteurization. It also circulates in pipes which line the wall of a small refrigerator room, where the butter and bottled milk are stored, until hauled to town. Cream to be held in cans is set into the tank where ice blocks are frozen.

One man cares for the entire plant, including the churning and packaging of 75 to 100 pounds of butter per day. For A-grade milk, such as is put out at this dairy, the raw milk must contain not over 100,000 bacteria per cubic centimeter; and this must be reduced below 10,000 by pasteurization, since the cows are not tuberculin-tested.

The reduction is accomplished by holding the milk or cream 25 minutes at 145 degrees temperature. Further increase of bacteria is prevented by cooling the milk and keeping it cold until delivered to the consumers.

ORCHARD TRACTOR SAVES MOISTURE AND DOESN'T BARK TREES.

[Written for Pacific Rural Press.]

Use of an orchard tractor permits cultivation closer to the trees, with less danger of knocking off the bark than with horses, in the estimation of H. G. Boyce, of the Winters district. Its steadiness and absence of doubletrees are the reasons. Moreover, Mr. Boyce believes he lost less moisture this spring, because with the tractor he double-disked both ways so soon after the land was fit for cultivation. Sixteen acres per day of about nine hours was disked; and about 24 acres per day were spring-toothed right afterward. The disk had to go three times per row, while the harrow covered a center in two trips.

For the 127 acres operated by Mr. Boyce, he keeps only four horses besides the 10-25 tractor; and the horses are "idle a good part of the time". They are preferred, however, for trucking in the orchard and for hauling fruit to town.

"I like the tractor for orchard work," says he, "and I think the time is coming when people can't do without one or more."

H. G. Hutchins of Terra Bella has recently purchased a Samson tractor and last week completed the installation of a Pomona deep well pump, with which he will irrigate a considerable acreage he is setting out to olives.

H. P. Smith of Butte County writes that he has been using a 12-25 tractor to pull four 10-inch plows in all kinds of soil, also for harrowing, leveling, checking, road grading, and pulling two five-foot Fresno scrapers.

FARM MACHINERY SCARCE—FIX UP OLD MACHINES.

[Written for Pacific Rural Press.]

Agricultural implement companies are advancing prices by the 10 per cents; and some of them are withdrawing quotations on many lines. At least one is not accepting orders for even fall delivery. Prices on raw material have advanced. The material itself is going into other channels. Labor is hard to get. It is possible that prices will fall within the next few years, but there seems no probability at all. People who wait till they need machinery are likely to get fooled in two ways—by paying more for what they get, or by not getting it at any price.

Our suggestion is that all Pacific Rural Press readers who are likely to need machinery this fall may well try at once to get reliable guarantees of immediate or fall delivery. Many country retailers still have odd machines in stock which they will sell low to avoid carrying till fall. If you can't get definite guarantees, see to it early that you get your old machinery repaired before time to use it.

MICA AXLE GREASE

Over \$100,000,000 have been spent by electric companies in California for new plants or service extensions in the five years since they came under supervision of the State Railroad Commission, according to President Max Thelan of the Commission.

KARDELL MOTOR PLOW.

[Written for Pacific Rural Press.]

Three mold-board plows hang on a frame under the seat, which is just behind the engine, of the Kardell motor plow. This takes away the friction due to the pressure of

common plows on the bottom of the furrow as they turn the furrow slice. The plow frame is hung securely to the frame which carries the engine; so the side-thrust of the plows comes, not against the landside of the furrow where it would create great friction, but against the tractor itself. Lever adjustments and stirrup equipment hold the plows at even depth on rolling ground. The drive-wheels, one on each side of the engine, have a "webbed tread" which looks a little like the openings of a turbine wheel. This tread is good on soft ground.

The rear end of the engine frame is supported by a furrow wheel which guides the outfit.

For heavy hauling on the roads up to eight miles an hour, an extension frame on two wheels is quickly bolted to the tractor engine frame, making a three-ton truck. The belt wheel delivers 30 horse-power, while the draw-bar pull is 15 horse-power.

STAUDE MAK-A-TRACTOR.

[Written for Pacific Rural Press.]

Channel-iron rear extensions of the Ford car frame support an axle on which tractor wheels are placed. These wheels are run by pinions, which replace the rear wheels of the Ford and mesh in a gear around the insides of the tractor wheels. It is claimed that the change from touring car to tractor or vice versa can be made in twenty minutes. As a tractor, it does the work of four horses plowing, drilling, hauling, harvesting, etc. Speed as a tractor is about two and a half miles an hour with the motor at 1000 r. p. m., which is the Ford speed for twenty miles per hour. A special radiator is furnished to keep the engine cool. A force-feed oiling system is added for permanent safety of bearings.

By putting a bolster on the tractor wheels and attaching the reach of any farm wagon, the tractor is converted into a truck for road use where it runs up to five miles per hour.

STRONG PLOWS FOR DEEP TRACTOR PLOWING.

[Written for Pacific Rural Press.]

A tractor rig is as good and no better than the plows one is pulling, according to Mode Foster, owner of a 75 horse-power tractor in San Joaquin county.

Mr. Foster doesn't believe in shallow plowing for grain on adobe soil, either for summer fallow or spring-planted grain; and to secure good, deep tillage he has had specially constructed plows made.

They are four-bottomed gangs, with exceptionally heavy standards, the wooden frame being well reinforced with steel beams. The mold boards also are made for deep plowing, the curve starting about eight inches from the bottom so that they will not do good work unless sunk in deep. Lighter plows would not stand the heavy load.

Two gangs of four plows each are all that can be pulled in adobe with Mr. Foster's engine, and that makes the expense per acre greater than shallower plowing; but the additional expense is more than shared by the increase in grain secured at harvest time.

Put cotton waste in open oil holes | the bearings and causes the oil to as this aids in keeping grit out of | feed down more slowly.

Samson Sieve-Grip Model S-25

READY?

Are you ready to get the best out of your farm this year? Have you ample power for this season's work? Do you want to get along with fewer horses and men?

SAMSON SIEVE-GRIP

Reg. and Pat. U. S. and Foreign Countries

tractors are built to help you do these things. Sturdy, simple, powerful, they can cut your farm power costs remarkably. Every farm where a Samson Sieve-Grip is working is being bettered, is producing bigger net profits.

General Agricultural Review

Field Crops.

Barley harvest commenced in the Sacramento Valley about May 7.

Glenn county is preparing land to nearly double the rice acreage over last year.

Many small parcels of land near Corning will be seeded to feterita corn this season.

The American winter wheat crop this year shows the lowest condition recorded since 1888.

Rice, beans and milo maize will be planted very heavily in the southern part of Butte county.

Ninety per cent of Canadian wheat will be sold to the allied governments or to Dominion mills.

Preliminary estimates show that Yolo county's rice crop for 1917 will be about 600,000 sacks.

The amount of paddy rice left in California in either growers' or millers' hands is insignificant.

Colusa county will raise a great grain crop this season. On the lower lands farmers expect a 125 per cent yield.

Trading in May wheat has been ordered discontinued by the Board of Directors of the Chicago Board of Trade.

According to the County Horticultural Commissioner there will be 20,000 acres of rice in Yolo county this season.

Alfalfa keeps on working for J. H. McDole of Willows while his fruit trees of all kinds are laying off on account of frost.

E. D. Marcellus of Chico last week sold 300 tons of alfalfa at \$12 a ton in the shock, which is equal to \$16 a ton in the bale.

Grain farmers north and east of Stockton recently suffered heavily from the passing of a plague of crickets over their fields.

The latest government forecast of the winter wheat crop in California this year places it at 4,870,000 bushels against an average of 7,166,000.

Quite a large acreage of tomatoes is being planted in Sonoma Valley this year. Growers are signing contracts with the Sonoma Valley Cannery at \$10.

The first car of 1917 barley arrived in Los Angeles May 3, ten days ahead of the usual opening of the season. The barley was raised in the Imperial Valley.

The hop acreage will be materially decreased in the Sacramento valley this year. Near Wheatland the Horst and Durst ranches have reduced their acreage nearly one half.

Sutter county will plant a heavy acreage to beans, milo maize and potatoes this season. Rice acreage will be reduced. Grain will make a normal yield, while hay will be short.

Deciduous Fruits and Berries.

The apricot outlook in Aromas is good.

Club girls in Arizona can the surplus fruit in shares.

"Flour goes up, berries go down," is the way berry growers put it nowadays.

Shipping of cherries began in Sonoma county last week. Early peas are looking fine.

H. A. Bassford of Vacaville had 2,500 boxes of cherries last year. He expects 5,000 this year.

The cherry crop in Alameda and Santa Clara counties promises to be larger than had been estimated.

Fourteen crates of plums from two of C. W. Carter's trees sold last year at \$1 per crate f. o. b. Los Molinos.

Pears in Sonoma Valley are good and prunes medium. Apples are a light crop, especially among the early varieties.

The first cherries of the season were shipped out of the Pajaro Valley and were grown in the Corralitos section.

Apple blossom time in the Hood River Valley, Oregon, which comes usually about May 1, will not be in full bloom this year until about May 10.

It is announced that the Central California Berry Growers' Association has obtained contracts representing 96 per cent of the nearby acreage.

Latest reports from the Yucaipa Valley say that all signs point to a heavy crop of peaches and apricots. The yield of apples, it is said, will also be large.

The peach orchard picture on our front page April 14 belongs to Fred H. Weeks of Red Bluff. Mr. Weeks had already determined to plant beans between the trees. Inter crops were suggested under the picture.

G. B. Abbott of Corning has controlled peach curled leaf perfectly for two years. This year most Elbertas in his county are full of it. Pacific Rural Press will tell how Mr. Abbott controlled curl leaf before time to spray for it.

Tehama county has the heaviest two crops of prunes we have observed in the Sacramento Valley. One belongs to the Northern California Nurseries Company and is on the Sacramento river bottom out of Corning.

The other orchard is owned by F. J. Tetrau and is also on the Sacramento river bottom near Red Bluff.

Pear blight has appeared in the Yucaipa Valley and is being vigorously fought by orchardists. Pear growers are cutting away every infected twig and the trees are being sprayed and tools disinfected after being used to prevent spread of the disease.

Citrus and Semi-Tropical.

Estimates place the Valencia orange production of the Fullerton-Placentia district at between 1,200 and 1,300 cars, a gain over last year's crop of more than 300 cars.

It is reported from the Barberton district in South Africa that after two years of drought the citrus crop this year promises to be a "bumper" one, but there is little hope of any export trade.

The Colton Fruit Exchange is in receipt of word from England that the third car of Tiger and Floral brand oranges shipped there brought \$3.30 per box f. o. b. Colton. The previous car averaged about \$3.80 per box f. o. b. Colton.

N. O. Newerl of Los Angeles has invented an adjustable cover for trees to do away with the smudge-pot. Speaking of his invention he says: "It not only affords protection from frost and heat but the cover will prevent citrus fruits from being soaked during rainstorms and enable orchardists to pick their fruit during periods of excessive rains."

The fourth semi-annual meeting and exhibit of the California Avocado Association is being held in Los Angeles, May 18 and 19. The avocado industry is growing in importance in this State. The food value of the avocado is very high. Ordinary varieties contain as high as 25 to 29 per cent of fat, and it is an easily digested fruit. One fruit of ordinary size is claimed to furnish enough food for a meal.

Olives to Pay Well.

The Heinz olive pickling works at Corning are contracting for Mission olives on a basis of \$175 per ton for 10-16s and up. The Maywood Company are paying \$225 for Sevillanos 16-16 size, and \$200 for smaller sizes. President Martin reports the sale of the remainder of last season's output of olive oil by the California Olive Growers' Association for \$2.25 per gallon, in cans. This association will build pickling plants at Oroville and Lindsay this summer.

Labor Exchange.

This department will print liners (not to exceed twenty words) free, one time, for farmers wishing to secure labor, and laborers wanting to get positions on farms. It is distinctly understood that the Rural Press does not undertake to vouch for or assume responsibility in any way concerning transactions which may result between employer and employee. Our desire is to bring the farmer and laborer in touch during this emergency. Copy must reach this office by Tuesday to appear in issue of Saturday following:

WANTED—Employment for self and team for months of June, July, August. J. N. Garrison, R4, Box 70, Watsonville.

Chalmers 7-Passenger Touring Car—Price \$1475 Detroit

Chalmers Is Built For Long Service

Chalmers builds for long life. Sturdiness is in every part. Severe usage and hard going only serve to prove Chalmers construction.

The Chalmers is a light weight, roomy car. Light weight insures right road performance and true economy. Long springs give easy riding qualities both on good roads and in the ruts.

Go to the nearest Chalmers dealer. See a Chalmers. Examine the car feature by feature. See the beauty of the

Chalmers lines. Note the fine body finish. The upholstery is genuine leather. The lamps are large and powerful. Point by point the Chalmers appeals to your good judgment.

Chalmers price is low for such quality. A cheap car is poor economy. A low priced, high grade, well performing car, such as the Chalmers is a genuine investment.

Ride in a Chalmers. You will then know its value.

Present Crop Outlook in California

CALIFORNIA WILL, FROM PRESENT INDICATIONS, PRODUCE A NORMAL CROP OF FRUIT, CANTALOUPE, POTATOES, ONIONS, ETC., BUT GRAIN AND HAY WILL BE SHORT. BEANS, RICE, AND SORGHUMS WILL BE PLANTED IN LARGER ACREAGE THAN EVER BEFORE.

Agriculturally this State was never so wideawake. The writer last week completed a 2,000-mile auto ride through the San Joaquin Valley, into southern California, and up through the coast counties into the Bay section and through the Sacramento Valley as far north as Tehama; and from observation and inquiries is of the opinion that the products of the State will come very near equalling those of any previous year, in spite of a dry season and killing frosts.

Grain is very spotted, but an average crop will be harvested in most sections. In the Sacramento Valley lowlands barley and wheat never looked better—many growers are anticipating 30 and 40 sacks per acre. On the higher land on the west side of the above section grain is poor.

Hay will be short, because of drouth in spots and because every field that will make grain will not be cut for hay. Alfalfa has been growing slowly—the first crop was late and of poor quality.

Corn and forage crops promise to make up for the hay shortage. In practically every section of the State increased acreages will be planted to Indian and Egyptian corn, milo, fetterita and sudan grass. The demand for seed has exceeded the supply. Silos are being built in large numbers to help conserve feed.

The potato acreage will be somewhat increased, but the scarcity of labor and price of seed have prevented many large acreages from being planted.

Rice is to be seeded over larger area. Especially is this so in the Sacramento Valley, where the acreage will be fully 25 per cent larger than last year. Growers are now offered 2c on contract, but no one seems willing to sell at that price.

California will surely feed the world on beans next winter, if the season proves favorable. Every section will plant beans, limas, small and large whites, pinks, Lady Washingtons, teparies, blackeyes and every other variety.

Sugar beets will also command increased attention. Many localities will grow from 25 to 100 per cent more beets than last year. Shortage of labor is keenly felt in this branch of agriculture.

Cantaloupes will commence going to the market this week from the Imperial Valley. The crop from Imperial and Turlock districts, as estimated by railway men, will be a normal one and will total nearly 10,000 cars.

DECIDUOUS FRUITS.

The deciduous fruit crop will probably make nearly a normal yield. Frost damage is overcome by new acreage coming into bearing. Almonds and apricots suffered most from the cold. In the monthly report sent out this week by the State Horticultural Commission the following estimate was made of the crop at this time:

STATE AVERAGES.

Almonds, 58 per cent; apples, 93; apricots, 57; cherries, 68; figs, 94; lemons, 91; olives, 96; oranges, 94; peaches, 83; pears, 99; plums, 60; prunes, 91, and walnuts, 94 per cent.

ALMONDS.

Butte, one of the greatest producers of almonds, reports a 15 per cent crop; Contra Costa, 60; Yolo, 40; Stanislaus, 100; Sutter, 65; Sacramento, 30; Solano, 10; Los Angeles, 50; Riverside, 70; San Joaquin, 100 per cent. These counties produce 78 per cent of the entire almond crop of California.

APRICOTS.

The following counties grow 91 per cent of the apricot output, the reports varying from 35 per cent to a full crop: Alameda, 45; Fresno, 60; Kings, 60; Los Angeles, 45; Monterey, 80; Orange, 100; Riverside, 50; San Bernardino, 100; San Benito, 75; San Joaquin, 90; Santa Clara, 35; Santa Cruz, 85; Solano, 50; Ventura, 70; Yolo, 45 per cent.

PRUNES.

Santa Clara produces 55 per cent of California's prunes and reports a 100 per cent crop, while Sonoma produces 12 per cent of the total and reports a 60 per cent crop. Solano 75 and Tulare 100 per cent.

PEACHES.

Peaches show a crop ranging from 30 per cent in Butte and Alameda counties to 80 in Placer and Santa Clara, and 100% in San Joaquin.

Plums and cherries got a pretty stiff jolt from Jack Frost, showing a percentage of 60 and 68, respectively. Fig trees were also frosted, but now promise 94 per cent. Vineyards are looking fine and the little berries are in abundant evidence as a promise of a big yield.

THE LONGER YOU DELAY

The less chance you have to talk to Patterson.
Patterson makes

"SECURITY LADDERS"

(of course they cost more)

He is touring the fruit growing districts spreading ladder truths and showing orchardists how to make money by picking their fruits from "Security Ladders."

Mitchell Junior—a 40-h. p. Six
120-inch Wheelbase

Mitchell
SIXES

\$1460 F. o. b.
Racine

7-Passenger—48 Horsepower
127-inch Wheelbase

Why Other Cars Omit These Mitchell Extras

The Mitchell offers you
31 extra features—
24 per cent added luxury—
100 per cent over-strength.

When you see these extras—
each a wanted feature—you will
ask why others don't include
them. This is to tell you the
reason.

Cost \$4,000,000

The Mitchell extras, on this
year's output, will cost us \$4-
000,000. To add them to the
ordinary car would bring the
price too high.

In the Mitchell plant, we save
them in factory cost. John W.
Bate, the great efficiency expert,
has worked for years to do that.

This entire 45-acre plant was
built and equipped by him. And
every detail is designed to build
this one type economically.

He has cut our factory cost
in two. No other plant could
build a car like the Mitchell at

anywhere near our cost. And
that saving goes into these
extras.

A Lifetime Car 100% Over-Strength

The 31 extra features—like a
power tire pump—will seem a
great attraction. The added
luxury—24 per cent—makes the
Mitchell the beauty car of its
class.

But our greatest extra is the
double strength in each impor-
tant part. In the past three
years we have doubled our mar-
gins of safety.

TWO SIZES

Mitchell—a roomy, 7-passenger
Six, with 127-inch wheel-
base and a highly-developed 48-horse-
power motor.

Price \$1460, f. o. b. Racine.

Mitchell Junior—a 5-passenger
Six on similar
lines, with 120-inch wheelbase and a 40-
horsepower motor— $\frac{1}{4}$ -inch smaller
bore.

Price \$1195 f. o. b. Racine.

Also six styles of enclosed and convert-
ible bodies. Also new Club Roadster.

Over 440 parts are built of
toughened steel. All safety
parts are vastly oversize. We
use a wealth of Chrome-Vana-
dium steel. We use Bate can-
tilever springs, which never yet
have broken.

We have proved that Mitch-
ells can run 200,000 miles. Few
owners will live to wear a
Mitchell out.

Our \$1195 Six

Now there are two sizes—
Mitchell and Mitchell Junior.
But even the smaller has a 120-
inch wheelbase. Both sizes of-
fer you values far beyond simi-
lar cars.

See these new models. See
all the extras they embody. You
will want such a car as the
Mitchell when you buy a car to
keep.

If you don't know the nearest
dealer, ask us for his name.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

Dairy Industry Must Organize

[Written for Pacific Rural Press by H. M. Ellis, Manager.]

There is no industry in California that is in as bad condition today as the dairy industry, and it is imperative that strenuous and persistent efforts be put forth to relieve the situation. The only way to accomplish this is for the dairymen to organize and work for themselves instead of for the speculator, who cares nothing for the farmer except to get all he can out of him. In spite of the high prices lately paid for butter fat, the dairyman is still losing money. Feed and all kinds of supplies are higher than ever before known, and the handlers of all these products get their price because they are organized. The average dairyman is not making any money—is not even getting the cost of production out of his product, and figures will prove this to be a fact. Prices paid for milk in California are the lowest of any State in the Union. The average price paid for milk throughout the United States is about twenty cents per gallon, but California dairymen do not get this price. The price the Eastern dairyman is receiving is much better than that the California dairyman gets, but the Eastern dairyman has only been able to get this better price by organization.

Why cannot the California dairyman accomplish the same result by the same methods? He can and he is doing so, and better results are coming, and very soon. Today there are four co-operative milk producers associations in California, all of which are working hard to better the dairyman's conditions, and to realize for him at least the cost of

production with a legitimate profit added. What is the result in any commercial line of business if the cost of production cannot be realized? The answer is, "Ruin." So with the dairyman, if he cannot get the cost of production, his answer is "Ruin" also. Why so many abandoned dairy farms over this State today? They would not be abandoned if the owners had made money. Unless the dairymen can make money they cannot stay in business, and the result will be a scarcity of the product and an increased price to the consumer.

A satisfied farming community spells prosperity for all. Prosperous agriculture builds up towns and cities, makes good business everywhere. The farmer is the backbone of the country. Make him prosperous, and the rest is easy. The Northern California Milk Producers' Association is one of the associations which is working hard to better the dairyman's condition, but to be successful it must have the loyalty and faithful support of its many hundreds of members scattered over the fourteen northern counties in which it will operate. The association belongs to its members and will be operated by them, and there will be no control by any outsider whose interests might be opposed to those of the dairymen. This association, working in conjunction with other like associations, hopes very shortly to realize a better return for its members by the betterment of conditions, elimination of waste, better marketing, and many other things.

Plans for a Sanitary Milk Room

A cheaply constructed but convenient and sanitary milk house is the one in use on the dairy of L. L. Long in Stanislaus county.

The building is 10 feet wide and 14 feet long, having a gable roof. It is located so that the door is in the end and faces the east.

The inside walls, from a height of two feet above the floor level, are covered with tongue and grooved ceiling, and the floor is of concrete, drained to the north side of the building, where is located a sink and drain board underneath a small window. Windows are also provided the other three sides of the building, screened to keep out flies.

The boiler is situated in the southwest corner of the building, pipes from which lead to the sink and to the skim milk pump that forces the skim milk from the building to the hog pens.

A recess in the south wall provides room for a galvanized iron vat into which the milk is poured from outside the building and which is connected with the separator by a pipe fitted with a strainer. The milk is also strained as it is poured into the vat. The separator, which sets on the south side of the floor near the vat, is run by electricity, a small motor being located near the ceiling on the north side of the building and connected with the separator by shafting and belts.

Between the separator and the east end of the building space was provided for a pair of scales and

a wall desk for the keeping of weights and records.

The floor of the building is four inches thick, but need not have been so thick. It was made of a mixture of one part cement to five parts gravel, while the side walls to a height of two feet were of a mixture of one part cement to four parts gravel.

GUERNSEY CATTLE RECORDS OF PRODUCTION.

To the Editor: Please print some late records of milk and butter fat produced by Guernsey cows.—R. G., Tulare.

Murne Cown is the leader, with 24,008 pounds of milk and 1098.18 pounds of butter fat in a year.

Guernsey Advanced Register Records, April 15, 1917.

Class*	Records	Lbs. Milk	Lbs. Fat	Per cent. Fat†
A.....	1708	10,228.11	502.71	4.915
B.....	337	9,738.61	485.02	4.981
C.....	454	9,293.92	466.22	5.015
D.....	471	9,078.53	456.71	5.030
E.....	589	8,391.98	423.60	5.053
F.....	725	8,074.85	403.77	5.062
G.....	1568	7,710.60	383.35	5.013

*Class A is 5 years or over. Each succeeding class is ½ year younger than the one above it.

†Notice consistent increase of fat percentage in the more recently-bred animals.

Stocks of butter in cold storage in Los Angeles May 3, 1917, were 49,885 pounds against 5,422 pounds the same date last year, an increase of 44,463 pounds. The holdings of eggs in cold storage in Los Angeles May 3, 1917, were 60,209 cases against 46,484 cases the same date last year, an increase of 13,725 cases.

Fortune Lurks in This Bull

Pride Fayne Valdessa Represents Greatest Holstein Blood.

PRIDE FAYNE VALDESSA
Born May 27, 1916.

This grand young individual, consigned by the Palo Alto Stock Farm to the sale of the California Breeders' Sales and Pedigree Company, is a handsome son of that great bred bull, Finderne Pride Fayne, out of Finderne Pride Johanna Rue 3rd, the world's record cow.

Pride Fayne Valdessa's dam, Finderne Valdessa Korndyke, one of the grandest heifers that ever lived, with a record of 19.16 as a senior yearling, is out of the former world's record cow, Valdessa Scott 2nd. The dam's sire, King Pontiac Segis Korndyke, a brother to a 40-lb. 4-year-old, a son of a 30-lb. cow and a grandson of a 37-lb. cow, is not only making good himself, but represents a wealth of large producing strains seldom found in any pedigree.

Pride Fayne Valdessa has a phenomenal pedigree. It contains three great world's record cows, as follows:

Segis Fayne Johanna, the ONLY COW to make 50 lbs. of butter in 7 days.

Finderne Pride Johanna Rue, 36 lbs. of butter in 7 days, 147 lbs. in 30 days and 36 lbs. in 11 mos. after calving. WORLD'S RECORDS.

Valdessa Scott 2nd, the FIRST cow to produce over 40 lbs. of butter in 7 days and 164 lbs. in 30 days.

We believe a great fortune lies in this young bull. His dam is sure to make a very large record—so sure are we of this we would not sell her at any price.

YOU NEED PRIDE FAYNE VALDESSA IN YOUR HERD!!!

BUY HIM AT SACRAMENTO, MAY 31.

Palo Alto Stock Farm

PALO ALTO,

CALIFORNIA

Real HOLSTEIN Quality

At Your Own Price

Our offering at the sale at Sacramento, Cal., May 31, 1917, consists of 10 highly bred females and 2 bulls.

One heifer whose first four dams average 34½ lbs. butter in 7 days, sire Spring Farm Pontiac Cornucopia, whose dam was the first 44 lb. cow, her dam a 31.70 lb. cow in our herd, who was sired by a brother to the twice 44 lb. cow Ormsby Jane Segis Aaggie.

A daughter of King Korndyke Sadie Vale, whose daughters are making such high records; her dam an own grand-daughter of Pontiac Korndyke, also De Kol 2nd Butter Boy 3d, both great transmitting sires.

A daughter of King Segis Pontiac, he being the best bred son of the great King Segis; her dam traces direct to Hengerveld De Kol and Pontiac Korndyke.

Seven other heifers equally well bred. Most of these heifers are bred to our herd sire, King Segis Alcartra Abbeckerk, whose first eight dams average 30 lbs. butter in 7 days.

The two bulls offered are both fine individuals and highly bred. One whose first six dams average 28½ lbs. butter in 7 days, sire Prince Gelsche Walker.

One a show bull whose dam has a 28 lb. 3-year-old record, with a good prospect for a much larger record; son of a 36 lb. bull.

ALL CAREFULLY SELECTED FROM OUR HERD
OF 123 HEAD.

Horse Beans as a Silage Crop

[Written for Pacific Rural Press by Prof. F. W. Woll, University Farm, Davis.]

Replying to question as to horse beans as a silage crop, would say that I know of no case where horse beans have been made into silage and have no record of chemical analyses of such silage. There would be no objection to the use of this crop for the silo, however, so far as the quality of the resulting silage is concerned, except that, like other legumes, it will make a more or less rank-smelling silage that stock will not eat very readily until accustomed to it. There is also a question whether the yields secured would be sufficiently large to give it any advantage over other leguminous crops, like alfalfa, soy beans, cow peas, vetches, etc. One ton of green horse beans contains less actual food value (digestible nutrients) than either of the crops mentioned, with the possible exception of cow peas.

The important points in making horse-bean silage, like legume silage in general, are to cut the crop before maturity, to get it into the silo promptly before it is much wilted, and to pack it thoroughly in the silo, especially around the walls. It is possible that horse beans may be grown and siloed with Indian corn to advantage, as is often practiced in the case of soy beans and cow peas. But in most sections of this State, alfalfa gives larger yields and is to be preferred as a silage crop to any of the crops mentioned, and alfalfa is mainly recommended for the silo in the case it cannot be made into a good quality of hay, like the first and the last cuttings, the former on account of weediness and the latter because of the difficulty that may be experienced in hay making after the rainy season has set in.

POINTERS ON BUTTER QUALITY.

Some pertinent comments on "quality butter" were made by S. L. Denning at the California Educational Butter Scoring Contest held at Fresno May 2. At this contest twenty-five cubes of butter were entered. Hans Beck, of the Danish Creamery, Fresno, received the highest score—94½ per cent. The average score was 92.5. Mr. Denning said:

"A few of the entries showed the use of some old cream and several were criticized for having a neutralizer flavor. The feed flavor was again common and in some entries very pronounced. There was a big variation in the color of the entries, with almost any shade from pure white up to a bright yellow. Probably some of the butter makers do not realize the importance of having the butter of the proper color. A butter too light or too dark must stand a severe cut when sold on the market. Several of the entries were mottled and a few contained grit. Both of these faults can be easily remedied by a little more working. A few of the entries were excessively high in salt. The cubes showed a wide variation as to size, shape and general appearance. Most of the boxes were very neat, but a few were very rough in appearance. The package often gives the judge or buyer his first impression of the product, and it is generally an index to the workmanship of the butter."

Mr. Harris, one of the judges, spoke of the irregularity of the package and said that he is cutting very severely on the market when butter appears in off-sized and poorly-made packages.

The individual dairy cow must be healthy, with clear, bright eyes, set well apart. The head is usually small, the mouth large, the neck long and muscular; the brisket is not so wide as in the beef cow. The hips are rather prominent, the thighs somewhat muscular, the legs set square with the toes pointing forward. The dairy cow must be quiet and gentle, the skin soft and velvety.

The fast milker stimulates the udder more than the slow milker, and thus gets more milk.

SPRING EXPOSITION

THIRD BUTTE COUNTY AGRICULTURAL, LIVE-STOCK AND POULTRY FAIR

Exhibit space sold 50 per cent greater than last year. More fine livestock than ever. See the stock judging, milkmaids' contest, Butte county boys' and girls' hog, dairy and beef judging contest. Do You Want Long Distance Backing?

We have a son of the California State Champion three-year-old for sale. Born October, 1915; Sired by PRINCE ALCARTRA KORNDYKE, whose dam is TILLY ALCARTRA.

The Dam of this young bull is not a fifty-lb. cow, but she has to her credit 21,208 lbs. milk and 800 lbs. butter in one year, which is the largest record ever made in California by a Junior three-year-old.

If you are in the market for a bull, it will pay you to visit our ranch and see what we have to offer—at prices that will surprise you.

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

B. M. Brown of Corning on the Whitmore place is gradually working into purebred Jerseys.

The Grace Bros. are erecting an up-to-date dairy barn and two silos on their ranch near Sonoma.

Tulare county dairies are in good shape now, according to County Dairy Inspector C. A. Peairs.

J. Risse of Los Molinos proposes to sell some of his purebred Jersey cows. It is the labor problem again.

The demand for milkers is so great in the Gonzales section that many of the dairies are running short handed.

The thirty-second annual meeting of the Holstein-Friesian Association of America will be held on the first Wednesday in June, 1917, at Worcester, Mass.

J. B. Kroetch of Willows is furnishing land and feed while his tenant furnishes cows and labor to care for them and cut the feed. They share equally in the proceeds.

Manuel Veter of Los Molinos, whose bulls for the past five years have come from the Vina ranch, proposes to sell 30 of his cows on account of the labor problem.

R. F. Guerin, Visalia, reports sale of three young Holstein bulls to L. E. Robertson, Tulare; John C. Jacques, Visalia, and Pitt Miller, Gustine.

Starlight's Contrast 33439, A. R. 2521, has just completed a record of 17,701.9 pounds of milk and 811.11 pounds of butterfat, making her Minnesota champion Guernsey cow of all ages.

O. J. Ames, Oakdale, reports the following sales of Jersey bulls to Louis Skadsheim, Winton; J. M. Aitchison, Winton; R. A. Smith, Oakdale; Mrs. S. W. Taylor, Loomis; E. O. Bleckschmidt, Patterson; and Harry Knoll, Valley Center.

The Western Meat Company of San Francisco, which during the past few years has built up a creamery business in connection with its meat packing interests, is about to enter the creamery field in the San Joaquin Valley.

Dairymen of Fresno claim that with hay costing from \$14 to \$16 a ton and mill stuffs at the highest figure in history, the sale of milk at the same price as before the war, has taken all of the profit from the milk industry.

Will. Vista 4th, an Ayrshire cow owned by Steybrae Farm, San Mateo, completed on April 30th 240 days of her yearly test with a production of 13,310 pounds milk. Only 134 pounds less than the production for 251 days

of Agnes Wallace of Maple Grove, the Jr. Champion Ayrshire.

Alameda county milk distributors and milk producers have decided to raise the retail price of milk one cent on the current measures. Pints and quarts will seek 7 and 11-cent levels beginning June 1. Producers advanced the price of milk in wholesale measures 3½ to 4½ cents a gallon.

W. M. Colbert & Son of Corning propose to sell their grade Jerseys to make room for the 13 purebred heifers bought through Mr. Louth of Orland from Kentucky last fall. They also bought the bull which headed John A. Lee's herd in Kentucky until early this spring.

The Napa State Hospital recently received a shipment of Holsteins from Washington including four heifers and the grand Champion Cow at Washington State Fair bought at Davis sale; also five cows from the herd of Wm. Bishop. One of the latter is now giving 80 pounds milk testing right around 6 per cent.

In official testing in the McAlister herd, 14 of the last 17 cows that have freshened have made over 24 pounds of butter; while 12 of the 17 made over 25 pounds, which include more 25-pound three-year-olds than have ever been made in any other herd in the State in one year. Seven different cows have broken State records for seven days in the last five months.

Clementine Mable, a Guernsey of the Bella Vista herd is the oldest cow in the State contest. At 11 years and 11 months, she produced in February 1,280.8 milk, 58.40 butter fat; March 1,406.0 milk, 56.91 butterfat. Her daughter, Kitchener Clementine by Imp. Lord Kitchener, is also in the State contest as a 2-year-old. In five and a half months she has produced 6,800 pounds milk and 245 pounds butterfat.

While at the Stanford ranch, Vina, last week, we found fitters at work putting several Holstein cows and heifers in shape to exhibit at the Chico fair next week. All of the Holsteins, numbering over 300 head, are to be sold at the great dispersal sale June 3, 4, 5, which should interest every dairymen of the Coast. Make arrangements to attend this greatest of all dairy sales. A description of this herd and its history will be printed in our next issue.

Swine.

The National Duroc-Jersey Record Association will offer at the International Livestock show at Chicago, annually, a cup to the student doing the best judging work on swine.

W. S. Guilford of Orland returned recently from a trip east, where he secured a fine imported Berkshire boar. Mr. G. reports a good demand for purebred swine at the Butte City ranch.

Sheep.

A Ukiah paper says 50 cents per pound for short wool is being paid in that city.

California wool is not as good as usual this season, buyers say, on account of short feed for the sheep.

How to get coyotes every time will be told in an early issue. It is the successful experience of a big sheep grower.

About 11,000 sheep were sheared in the Panoche section this season, the owners being Miguel Yparra-guirre, Bernardo Yturriate and a sheepman from Newman.

J. R. Garnett of Willows, who last summer bought 100 purebred Shropshire bucks from the Meacham estate of Petaluma, reports that they sired the finest lot of lambs he has had in ten years.

Professor David N. Morgan, assistant to Dean Thomas F. Hunt, suggests that the large acreage in San Mateo and Santa Clara counties which are being held as potential residential places be thrown open to sheep pasture.

"The American Sheep Breeder" proposes to apply the acid test to the patriotism of American shepherds, and appeals to every shepherd for two fleeces of wool to furnish raw material for a large number of uniforms for the army.

Unless Idaho and Utah sheep men can get 60 cents a pound for their wool they cannot break even, according to R. W. Katerndahl, counsel for the stockmen who have started a campaign to keep up the price of wool.

It is said that on the foothills that hem in Mentone in the upper San Bernardino valley are a number of small herds of angora goats. That country is an ideal place for developing the goat industry, which is just getting a start.

A demonstration of market lambs, of special value to sheepmen in California, is planned as a special feature of "Farmers Week," to be conducted by the University of California at the University Farm at Davis from May 29 to June 1.

Recently H. Stanley Coffin of North Yakima, Wash., one of the largest wool growers in the country, returned from a trip through Australia and New Zealand and brought with him \$20,000 worth of sheep from those famous wool-growing countries.

The United States Government has sufficient wool to meet its present needs and there is no reason for wool growers to feel uneasy, according to a telegram received today by J. N. Burgess, director of the Oregon Wool Growers' Association from Dr. S. W. McClure, secretary of the National Wool Growers' Association.

Beef.

J. I. Cazler of Wells, Nevada, has recently secured from the Hereford Association, Cheyenne, Wyoming, 75 head of purebred heifers and calves, and from Geo. Chandler, Baker City, Oregon, three purebred Hereford bulls.

T. S. Glide, proprietor of the Hillcrest stock farm, recently sold a 2-year-old Shorthorn bull, sired by King Lancaster, to William Pierce of Suisun for \$1,000.

Miscellaneous.

Pastures in San Luis Obispo and Santa Barbara counties look fine and stock are fat.

Silos are being built in large numbers in the Sacramento valley. Many new purebred herds of dairy cattle and hogs are also being started.

A red Durham cow, owned by Roy Bauer, a rancher in the Covelo valley, gave birth recently to four healthy calves, weighing 40 pounds each. There were two heifers and two bull calves. All are doing well.

A Promising Lot of Heifers.

The Henderson Company, breeders of purebred Holstein-Friesian cattle, report good records completed recently. The heifers were fed on 10 to 15 pounds of corn silage, and 10 to 12 pounds of concentrate composed of bran, ground oats, ground barley equal parts, with 2 pounds of oil meal and 2 pounds of corn meal for a period of about six weeks before calving, finishing the last week with ration of 8 pounds of bran, 2 pounds oil meal, just before calving time. In addition they had alfalfa hay, of inferior quality. White Daisy Segts Queen made in 7 days 393.4 of milk and 17.10 of butter. Model Queen Pet Segls made 402.4 pounds of milk and 17.691 of butter. Korndyke Witkop De Kol II made 411.7 of milk and 19.64 of butter. Sunnyslope Duanna Pietertje made 405.9 of milk and 22.463 of butter. This class of heifers are all within 2 years and 4 months of age and nearly the same type of animals.

HOG CHOLERA

In introducing the Dorset-Niles method of immunization as recommended by the U. S. Government, the Stockyards Serum Company of Kansas City, through their representatives, Mr. L. B. Green and Dr. E. M. Leaf, wish the hog raisers of California to know of the splendid results obtained in the Imperial Valley by such firms as Timkin Ranch Co., Lyons Bros., Russell Bros. and Stuart, Hale Ranch Co., D. Messmore, Thompson Bros. and many others. For vaccination or serum see Green & Leaf, Hog Cholera Specialists, 401 Bryson Bldg., Los Angeles, California. Phone Main 1107. (Cut this out for future reference.)

G. E. Trigg Wins Rural Press Prize In State Dairy Contest.

Our records show that G. E. Trigg of Ferndale, Humboldt county, had the five highest-producing grade cows in the State Dairy Cow Competition during the month of April and is, therefore, entitled to the Pacific Rural Press prize for last month. The average production for the month was 1,744 pounds milk, 82.372 pound fat, average per cent 4.7. The production of butterfat for the individual cows was as follows: 91.7, 82.3, 82.2, 78.6 and 77.1 pounds. These cows are all grade Jerseys. Eight other dairymen competed for the Rural Press prize during the last

month, the average production of milk and butterfat of five grades in each case being as follows:

	Lbs. Milk	Lbs. Fat
F. Stenzel, San Lorenzo	2049.4	70.991
J. W. Coppini, Ferndale	1254.0	65.654
Iver Iverson, Arcata	1451.1	61.969
K. W. Abbott, Milpitas	1659.8	60.061
Hollow-Hill Farm, Colton	1669.2	59.931
Floyd Beebe, Woodland	1471.8	59.320
F. O. & K. U. Bonnett	952.0	42.898
J. M. Christen, Pacheco	1153.7	41.316

I would ask you, therefore, to send Mr. Trigg your check for the Rural Press prize money for the month of April.

F. W. WOLL, Supt. of Dairy Testing.

A Successful Shorthorn Sale.

[The following account of the Carruthers Farms sale was put in type last week, but left out through an inadvertence in the mechanical department.—Editor.]

A fine day, good sized crowd of buyers, Scotch purebreds in fine condition, a live auctioneer, all contributed to the success of the first Shorthorn sale staged by the Carruthers Farms at Mayfield, Wednesday, May 2d. Mr. Carruthers knows stock and how to fit them and he knows how to work up a sale. He also knew how to secure a good auctioneer, as evidenced when he selected Col. Carey M. Jones of Chicago.

The total of the sale amounted to \$15,895 for 43 head, males and females. Average price paid for females was \$475. Total average \$370. Following is a list of animals and buyers' names:

White Brier and calf, T. T. Miller....	\$2,000

Palo Alto Stock Farm Will Offer Bull of High Pedigree.

In selecting a consignment of eight females and two males to the Holstein sale to be held by the California Breeders' Sales and Pedigree Company at the State Fair grounds, Sacramento, on May 31st, the Palo Alto Stock Farm has included Pride Valdessa 187266, a young bull bred in the richest purple of the black-and-white aristocracy. He has a pedigree that contains the world's three great record cows—Segis Fayne Johanna, the only cow to make 50 pounds of butter in 7 days; Finderne Pride Johanna Rue, 36 pounds of butter in 7 days, 147 pounds in 30 days and 36 pounds 11 months after calving; and Valdessa Scott II, the first cow to produce over 40 pounds of butter in 7 days and 164 pounds in 30 days. Pride Fayne Valdessa is a handsome son of Finderne Pride Fayne, out of Finderne Pride Johanna Rue III. His dam, Finderne Valdessa Korndyke, with a record of 19.16 as a senior yearling, is out of the former world's record cow, Valdessa Scott II.

BEEF CATTLE.

FOR IMMEDIATE SALE—15 registered Shorthorn bulls, one year to three years of age. Grand individuals in good flesh, fashionably bred from high-class sires and dams. Also two registered Percheron stallions—cheap. Apply: Wm. Bond, Mowry Station, near Newark, Cal.

SCOTCH AND SCOTCH-TOPPED SHORTHORNS—We have the largest herd of straight Scotch cows in California. Foundation stock of both sexes for sale; also a choice lot of range bulls. Barco Ranch, Hollister, Cal.

D. O. LIVELY STOCK FARM, INC., 216 Hobart Bldg., San Francisco, breeders of Hereford cattle. A few choice heifers for sale. We buy and sell livestock on commission. Farm at Mayfield, Cal.

REGISTERED YEARLING SHORTHORN Bulls—Heavy-boned, thick-mated Scotch and Scotch-topped breeding. Ormondale Co., Route 1, Redwood City, Cal.

BREEDERS OF REGISTERED SHORTHORNS—Milk strain. Choice young stock for sale. John Lynch Ranch, Box 321, Petaluma, Cal.

REGISTERED AND UNREGISTERED—Shorthorn bulls for sale. Paicines Ranch Co., 320 Sharon Bldg., San Francisco.

INNISFAIR DAIRY SHORTHORNS—Registered young bulls for sale. Alexander & Kellogg, Suisun, Cal.

HOPLAND STOCK FARM—Registered Shorthorns. Prices on application. Hopland, Cal.

REGISTERED HEREFORDS—H. H. Gable, Diamond G Ranch, Esparto, Cal.

SIMON NEWMAN CO., Breeders of Registered Herefords. Newman, Cal.

GEORGE WATTERSON—Breeder registered Herefords. Bishop, Cal.

SHORTHORNS—Carruthers Farms, Mayfield, Cal.

SHORTHORNS—Fair Oaks Ranch, Willits, Cal.

SHEEP AND GOATS.

D. E. KELLHER, importer and breeder of Hampshire sheep, Eugene, California, offers for sale a choice lot of Hampshire Ram Lambs, sired by Walnut Hall and Butterfield; rams purchased at Salt Lake, August, 1916; lambs ready for delivery after July 15, 1917. Inspection and correspondence invited.

F. A. MECHAM ESTATE, Petaluma, Cal.—Breeders and Importers of Shropshire, Rambouillet and American Merinos, both sexes. Also Red Polled cattle. Take electric car at Petaluma or Santa Rosa for Live Oak Ranch.

KAUPKE BROS., WOODLAND, CAL.—Breeders and Importers of Hampshire sheep.

DORSETS AND ROMNEYS—Dorset ram lambs for sale. John E. Marble, Los Angeles.

BISHOP BROS., SAN RAMON, CAL.—Breeders and Importers Shropshires.

CHAS. KIMBLE—Breeder and Importer of Rambouillet. Hanford, Cal.

MISCELLANEOUS.

CROLEY'S BALANCED DAIRY FEED—the cheap milk producer; and Croley's Calf Meal—the best California calf raiser. Geo. H. Croley Co., Inc., 631-637 Brannan St., San Francisco.

BUTTE CITY RANCH—Shorthorns, Shropshires, Cholera Immune Berkshires and Ponties. Special offering of sows, pigs and bulls. Butte City Ranch, Box P, Butte City, Glenn Co., Cal.

FEED, FREE RANGE, State, Government land, any amount. Booklet free. Joseph Clark, Sacramento.

Profitable Lamb Feeding Experience

[Written for Pacific Rural Press.]

Lamb feeding for the spring markets on irrigated areas is an accomplishment of Emory Gates of Stanislaus county, who marketed 3,000 Wether lambs between October 28, 1916, and April 15, 1917, at a gross profit of about \$5.50 a head. Mr. Gates is purely a lamb feeder, securing his lambs from the owners of large range-raised flocks at a time of year when succulent wild feed is scarce and when prices are low. Last year his lambs were bought for \$5.00, the lot having been assembled from three flocks from widely separated districts and turned over to Mr. Gates at a point about eighty miles from his ranch. They were of mixed breeding, part being Merino, part Lincolns, and part Shropshires, the Lincolns having proved to be the best feeders. During the drive home they were dipped, as they had been exposed to scab, but by going slowly on little-traveled roads they gained weight on the trip.

FEED AND WATER

Ordinarily, Mr. Gates prefers to get delivery October 1 to 15, as by

that time the waste products which he utilizes are ready to be pastured. These feeds constitute a wide range of products, such as watermelons, beet tops, bean straw, vineyards, and stubble, all of them being secured cheaply after the main crop has been harvested. Last season Mr. Gates secured 160 acres of waste melon land at fifty cents an acre and bean straw at fifty cents a ton; and other feeds were bought at correspondingly low prices.

The flock was divided into three smaller lots of 1,000 head each, water being provided by a portable pump and engine and water troughs. A generous supply of salt and sulphur was furnished at all times.

The flocks were run on the rented lands till the first of January, when they were taken to the Gates home ranch, which lies along a river and which has good drainage.

HAND FEEDING

The four feed lots are situated on sandy soil near the farm buildings and equipped with feed and watering troughs, no protection from the weather being furnished. The past winter a daily ration of about one pound of cracked beans, either blackeyes or pinks, the former being preferred, one to one and a half pounds of chopped alfalfa hay, and a like amount of corn silage, was fed most of the time. Cracked corn and cottonseed meal were fed some, but proved too expensive. Some cull raisins were also fed with good results until they began to spoil and the price became prohibitive. When possible, the lambs are separated according to the way they eat, some being much better feeders than others. To the watchful shepherd, they are not hard to pick out.

MARKETING AND PRICES

Four carloads were marketed as soon as the flock was brought to the home ranch, and at regular intervals from then on the tops were cut out and marketed, usually when they weighed about 100 pounds. As the season advances heavier feeding is practiced with the intention of forcing; but at the same time care is exercised not to get them "off their feed." This is done in order that the largest possible number may be marketed at the highest price.

Some losses are experienced, Mr. Gates figuring on a three per cent loss during the season from sickness and death. He had no difficulty with dogs because of the careful watch that is maintained at all times. When dogs appear on the ranch they are shot.

Under ordinary circumstances, a cow should be bred at from 10 to 14 weeks after milk is being made.

Putting a little meal in the calf's mouth as soon as it finishes its milk, gives it a taste for grain.

Make all changes of feed by a gradual process, so as not to cause scours in the pigs.

Fat sows become lazy and fail to take the necessary exercise unless compelled to.

Protect cows from flies with a spray.

Hillcrest Stock Farm

Shorthorn Cattle, Shropshire and Merino Sheep

King Lancaster, sired by King Edward, grand champion bull State Fairs, 1909-10-11.

Shorthorn Bulls for Sale, sired by such noted bulls as King Lancaster, Knights Perfection, Greenwood Knight and Greenwood King. Nearly all offsprings of the famous King Edward.

These Bulls are conceded to be the best offering ever made from the Hillcrest Stock Farm.

VETERINARY QUERIES

[Answered by Dr. H. B. Wintringham, Petaluma, Cal.]

[Subscribers wishing an immediate reply should send money order for \$1.00. No charge for questions answered through this department. Name and address of subscriber must accompany each query.]

Heifer With Urinary Trouble.

To the Editor—I have a Jersey heifer, two months old, which has some trouble with the kidneys or bladder. She jumps about, kicks, switches the tail, and finally urinates a large quantity. Her urine has become bloody, and she lies down much of the time. Her mother came down with milk fever, and a week later had mastitis. I fed the milk to the calf, but later took it away. What would you advise?—M. S. C., Dinuba.

A change of diet is indicated here. Give a gallon of whole milk three times a day and what green alfalfa she will eat. Give one tablespoonful fluid extract saw palmetto twice a day.

These Pigs Have Cholera.

To the Editor—About three weeks ago I had my sows vaccinated for cholera, and three or four days later the little pigs began to get sick and have been going from bad to worse ever since. They were sucking the sows at the time they were vaccinated. I have been feeding the pigs ground dry barley and alfalfa, but they refuse to eat. I have taken them away from the sows. They are weak and scour bad. Before I had the sows vaccinated they were all strong, healthy pigs, and the largest pigs seem to be the worse off. What can I do for them?—W. W. D., Arboga.

These pigs should receive a dose of cholera serum, as they have hog cholera.

Horse Rubs Off Tail and Mane.

To the Editor—My horse rubs his tail and mane off. What shall I do for it? I feed rolled barley and alfalfa; also a little bran. Quite a number of other horses in the neighborhood are the same.—C. G., Corona.

Have your veterinary give a hypodermic of sodium cocodylate for this trouble.

Warts on Teats.

To the Editor—Nearly all the cows which we are milking have an excessive number of warts on their teats. Some are the seed warts which grow in bunches and some are the large ones. Is this a contagious disease, or is it in their blood? All the young stock get

them shortly after freshening. What would you recommend to rid them of the warts? When would be the best time to do it?—E. N. S., Sausalito.

Seems to be contagious in certain herds. Paint with two per cent solution iodine.

Will Cows React?

To the Editor—In reference to cows placed on sale which are tuberculous, if given a double dose of toxin (or tuberculin), would it prevent a reaction within thirty days?

When cattle are bought at sales at a ten-day retest, is it safe? Or would a sixty-day retest be the best and safest guarantee to buy on?—D. L. Z., El Centro.

Yes, to your first question. If bought subject to a retest, do not test for ninety days to be sure.

Lump On the Jaw.

To the Editor—Can you give any cure for what I think is the beginning of lump jaw, other than that in "1000 Questions"? I think it originated from foxtail and is about as large as a half dollar, but seems to be fast to the jaw.—J. W. K., Highland Springs.

Paint with iodine once a day and give one dram potassium iodide in water three times a day.

Cow's Milk Bitter and Stringy.

To the Editor—I have a cow coming fresh about June 25th. She is now drying up. I grazed her along the roadside. Her milk got bitter and the cream would not come to butter. I then fed her alfalfa hay and some green alfalfa pasture, with plenty of salt, but her milk is the same and is turning thick and stringy. What is the trouble?—C. A. A., Oakdale.

This cow will come in earlier than you expect, and should be dried up immediately. The trouble is due to imminent parturition.

Enlarged Liver in Rabbits.

To the Editor—Are there any remedies for enlarged liver in rabbits? I have lost young ones around two months old. I feed different kinds of hay and rolled barley.—R. I., San Jose.

Give a one-tenth grain dose of calomel.

Raising Poultry for Profit

QUESTIONS ANSWERED.

[Answered by Susan Swaysgood.]

INCUBATOR HUMIDITY.

What per cent of humidity should I maintain in my incubator for chicken eggs and what for ducks?—J. W. L.

You should follow the directions sent you with the incubator. That is the safest way. I personally would not give room to a hygrometer, as I always go by the size of air cell. If too much moisture is used the air cell grows large and the chick matures too early, filling up the egg before the time; then it exhausts itself before hatching. If no instructions were furnished with the incubator, write to the Petaluma folks and tell them what model you have and ask for instructions. They will respond quickly.

THIS QUESTION A PUZZLER.

The upper bill of our ducks last year shriveled up at a few weeks of age, though they were alright when hatched. What is the cause?—J. D., Napa.

This question is a puzzler. It may have been caused by brooder heat, but honestly I do not know what could cause such a phenomenon, so cannot help you in this matter. I have seen many chicks hatched with the upper bill shorter than the lower, but in no case did the change occur after the chicks or ducks had been hatched right. Are you quite sure they were right when hatched? because incubating does some funny stunts, but nature does not often commit such grave faults after hatching.

HENS CONSTIPATED.

What is wrong with hens whose bowels move only under great difficulty? They pass a whitish substance and strain so hard that the vent protrudes quite a bit. We feed corn at night, mash mixed with warm buttermilk in the morning, and dry mash at noon, with plenty of green feed. The mash is bran two parts, middlings one part, crushed barley and oats one part, charcoal about one part.—I. D., Acampo.

Your feed appears all right. Give them about a half pint of coal oil in one gallon of the warm mash and repeat two days later; then give ten drops nux vomica in a quart of water each day for a week.

CHICKS PIP, BUT DIE.

Have set my two incubators twice this spring and can get only one-fourth hatch. I attend incubators according to directions. Chicks develop alright, and even pip the eggs, but seem too weak to get out?—Mrs. J. C. M., Brawley.

If you are using brown shelled eggs, the shells may be too hard for chicks to break out. Get a box of Egg-O-Hatch, which rots the shells. If you have white-shelled eggs, the trouble may be in feeding the hens too much moisture, or not airing the eggs enough. For further information write more details to me at Pomona.

GETTING RID OF NITS.

Some time ago a question was asked about getting rid of the nits laid by body lice on the feathers. In dusting, it is necessary to dust three or four times in order to get all of them; but I have lately found that if equal parts of good, strong

vinegar and coal oil are mixed and the feathers washed with the same, the nits will not hatch, as the action of the acid and coal oil kills them. It is necessary to keep the liquid stirred up so that you won't use all coal oil or all vinegar at one time. Coal oil alone would burn the hen to some extent, but when mixed with vinegar is quite safe to use and is a great help in ridding fowls of lice; for once the nits are killed there is no further trouble. And it is just as easy to keep chickens free of these pests as any other animals.

POULTRY FOR PROFIT.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Poultry for profit—that's what we aim to teach in this paper. When you keep poultry at a loss it is because you do not pay proper attention to what is said in these columns. So if you are not making a profit on your poultry, just turn about face, look up your old files, and read what has been said. One lady recently wrote me that she hardly knew a rooster from a hen, until she began to read the Press a little more than a year ago, and that now she is having splendid results with her flock of poultry; and the Press and California Poultry Practice have been her only guides.

And perhaps here lies the secret of her success. Too many cooks "spoil the broth," and reading and listening to too many different opinions on poultry matters are just as likely to spoil the profits.

There is just one thing you can't do successfully, and that is keep changing from this to that with poultry and have good results. The hens resent any new contraptions either in yarding or feeding by withholding the eggs, unless it is done very gradually.

If you are doing well, be satisfied; if you are not, then make a change, but make it just as gradually as you can, so that the flock will not be put out or inconvenienced at all. I just tried moving five hens out of a rather small yard that I wanted to sow to green feed for baby chicks; and although the place I put the hens into was far superior in size and convenience, it bothered them, and in spite of all I could do two eggs were broken and eaten. Now that may give them a decided taste for eggs, so that they will be on the watch for any more broken eggs, for it is often this that causes egg eating.

RESETTING SETTING HENS.

[Written for Pacific Rural Press.]

Last year fifty chicks were hatched in June for Mrs. C. H. Gould of Riverside county by three hens. All were given to one hen, which raised every chick. The two other hens were reset twice afterward.

The fifty chicks were placed in a small box with the hen and fed lots of corn. The corners of the box were rounded with dirt to prevent chicks from crowding and smothering each other. After they were a few weeks old, they were

allowed to run in day-time and shut up at night in a larger box with plenty of straw in it.

This year Mrs. Gould had sixty chicks hatched before April 7 by five Rhode Island Red hens. These were given to two of the hens, and the others reset the same day. The latter were fastened into the nests with slats, and after the third day were resigned to another period of setting. In dividing the chicks the most vigorous and more than half were given to the larger hen.

PLANT SOME MANGELS.

After taking off a crop of lettuce or other green feed, plant some of the large varieties of mangels both for your own use and the chickens. Nothing gives so much in quantity of real food value as mangels. Cut in two and staked cut side up in the poultry runs, there is nothing quite so good during the fall months for the molting hens or during the early spring months before green feed comes. Now that all frost has gone 'is the time to plant. The old Gatepost is a good variety, or if you prefer an ovoid form you will get weight and size with either sort.

WHAT TO FEED.

The best way to feed is to give a variety of whatever we can get that is handy and cheap. Mind that we do not feed a ration that is too bulky without being nutritious.

If chicks and hens get plenty of exercise, they can use more rough feed than if they are confined in small houses and pens. When feeding rough coarse feed, always be liberal with the grit and sand.

POULTRY NOTES.

In setting hens at this season of year be sure to set them as near the ground as possible so that the moisture from the earth will rot the shell.

The University of California in order to give poultrymen expert instruction in the business of producing chickens and eggs will conduct a short course of poultry husbandry at Pomona June 19 to 21, inclusive.

It is said that buttermilk has proved a cure for one of the most fatal diseases of young chicks in California—coccidiosis. The announcement is made by Dr. J. R. Beach, assistant in veterinary science at the University Farm at Davis, in a bulletin which may be obtained by writing to the College of Agriculture, Berkeley.

The egg situation is a decidedly bullish one, judging from a cold-storage standpoint. The government report, April 1, 1917, showed there were held in cold storage by 293 firms 164,518 cases of eggs, against 182,706 cases held by 212 firms the same date last year. There were taken into cold storage during March by the same firms 159,238 cases this year, compared with 148,267 cases during March of last year. The holdings on March 1 of this year were only 5,280 cases, against 34,439 cases the same date last year.

Automatic Septic Disposal of Farm Sewage

[Written for Pacific Rural Press.]

Two hundred and forty-six septic tanks for sewage disposal of the type illustrated on this page have been installed on the farms of Napa county within a year, according to Napa County Farm Adviser H. J. Baade, to whose campaign, through the Farm Bureau, these results are largely due. The cost, excluding labor, has averaged \$16.50 per tank. Contractors put them in at \$30 per tank.

Mr. Baade gives credit especially to Miss Lillian D. Clark of the University of California for general design of the tanks he has advocated.

"Every farm home should have an indoor toilet, sinks, bath, and stationary washtubs," says Mr. Baade.

All sewage from the house runs into one of these tanks and, without artificial addition of chemicals or bacteria, the sewage is decomposed and emerges as a clear liquid. We know of one in Santa Clara county, built ten years ago from redwood, which has worked perfectly ever since and has never required cleaning. The typhoid-fly breeding, the odorous slimy back yards, the carrying of dish water, etc., are all eliminated by having proper plumbing in the house and a septic tank. But concrete is generally preferred on account of its permanence.

Bacteria which decompose the sewage become naturally established, and large quantities of disinfectants thrown into the sewer, might destroy them. Otherwise there is no restriction on what shall reasonably go into the septic tank.

The tank can be built entirely underground if its discharge can be built low enough in drainable soil. There is no objection to its being built above ground.

The two-compartment tank has been found most satisfactory. Not a complaint has come from the 246 in Napa county. "They work splendidly and automatically," says Mr. Baade.

Referring to the diagram, the top view shows a manhole for each compartment big enough so a small man could get in if required. If properly constructed, the most cleaning that will be required for decades to come will be to pump out a little sludge. The caps may be sealed with cement, though no odor is noticed if they are not. A floating mat of sludge forms soon after the first sewage is turned in, and so long as this mat remains unbroken odors do not escape. The side view shows how sewage comes into the first compartment without breaking the sludge mat.

A size is recommended that will hold 70 gallons per person in the fam-

ily per day. For six persons it should be 4x9x5 feet; for 12 persons, 4x10x6 feet; for 25 persons, 5x14x6 feet. This permits sewage to remain in the first compartment until the solids are all liquefied. They then pass through the two 3-inch pipes set at an angle of 45 degrees in the partition. The upper ends of these pipes are in the second compartment to exclude all air which would be fatal to the important bacteria in the first compartment. The sewage remains in the second compartment long enough to clarify, if the tank is of proper size. To exclude air from the inlet to the first compartment, the U-shaped trap is built, remaining always full of fresh sewage.

The discharge pipe opens well toward the bottom of the tank to force the latest additions to remain long enough. The distribution system, where the tank cannot discharge into a creek or arroyo, is best illustrated in the "top view showing interior construction." This is of four-inch non-glazed tile, laid with loose joints to permit the liquid to soak away into the ground, and with no short turns which might fill with dirt from outside. In fine sandy soil the joints should be covered over the upper side either with mud or other material.

The concrete is made of one part

cement to five parts gravel; or cement, sand and crushed rock in the proportion of 1-2-3. Wet to a mushy consistency and spade it thoroughly as it is filled into the forms, working the spade up and down between cement and form. Old iron rods, heavy wires, woven wire, etc., can be used for reinforcement, using some extra in the top. Where rods are used, they may be spaced a foot apart in the walls. Four inches thickness is recommended, and the inside should be plastered with one part cement to three parts sand to make it surely waterproof. The pipe from house to tank should slope not less than one foot per 100 and its joints need to be carefully cemented.

The following bill of materials is enough for the twelve-person sized tank, allowing some waste: Four yards clean gravel; 18 sacks cement; one trap; two elbow joints; one cross tee; sewer pipe from house to tank and for distributing system, and the four sections of pipe needed within the tank; rings for the manhole covers; reinforcement and old lumber for forms. Four-foot dry goods boxes set in holes dug in solid ground eight inches greater dimensions may work, but for easy removal forms built and braced in place are better than the boxes.

Specifications for Concrete Septic Tank to permanently and automatically dispose of sewage, adding convenience, healthfulness, and attractiveness to farm homes.

Mrs. Best's Letter.

MILLINERY HINTS.

My Dear Friends—As the season advances, white seems to be the popular color for the summer hat. In straws there are Milans, Leghorns and peanut straw; and in the made hats there are crepe, braid, silk and ribbon used.

The Milan straws are wonderfully soft and come with rather wide brims and simple ribbon trimming. The Leghorns are pretty and are less tailored than the Milans, many of them being in droopy shapes or with a coquettish upward tilt at the back. These are trimmed with broad ribbon or a scarf, and are very pretty for wear with light summery dresses. The peanut straws are almost all in droopy garden shapes, as they are not strictly dressy hats, and their trimming varies according to the taste of the wearer. Many of them have a single ornament, flat on the crown, while some have a dainty pattern in crochet yarn. Still others have a narrow ribbon of color tied around the crown, bow in front and a band of braid of the same color as the ribbon around the edge of the brim. There are endless combinations, depending upon the use to be made of the hat.

In the made hats, crepe has been wonderfully popular, either the whole hat made of it with a little crochet trimming, or combined with braid. If you want to make one of these hats at home, a little braid helps cover up inexperienced stitches at the edge.

Silk hats are made in all shapes, the plain colors being in the more severe hats, while the gay silks are in sailor or droopy shapes. The greatest thing to look out for in home millinery this year is not to over trim. Everything is simple, and in almost all hats the trimming is flat. No waving plumes nor nodding flowers this year, if you want to be in style.

The ribbon hats continue to be popular, and deservedly so, for they are so soft and becoming to many people. White rather leads in popularity, although there are colors shown, of course.

The separate skirt has come into its own again this year, and is responsible for a certain fancifulness you never see in suit skirts. White, gray, navy, brown and blue combined in soft stripes and plaids are much used. These skirts are made either pleated all round or in panels, and if the material is stripes the pleats are laid so that one color comes on the top of the pleat, and the other color shows in walking. They make very striking looking skirts and are finished at the waist with a rather wide belt. Belts, forming a cross band over the pockets, pocket openings covered with color-lined ruffles, inserted pockets, demurely bound and patch pockets with large flaps and buttons, are among the new ideas for the separate skirt. ROSABELLA BEST.

HOW TO SELECT FOODS.

The following suggestions on getting the most food for one's money are from United States Department of Agriculture, Farmers' Bulletin 808, "How to Select Foods."

THE HOME CIRCLE

Use cereals (flour, meal, cereal breakfast foods, etc.) freely, taking pains to vary the kind used from day to day if necessary to keep people from tiring of them. Remember that a quart of whole milk a day for each child, to be used as a beverage and in cookery, is not too much.

Do not be ashamed to plan closely. Thrift in food means providing enough food, neither too little nor too much. Notice carefully how much of such staples as flour and sugar is used each week for a month and see if there are any ways of cutting down the quantity needed.

Buy non-perishable materials in quantities if better prices can be secured and there is a good storage place in the home. Estimate carefully how much of any material will be needed before laying in a supply, then see that none is wasted by careless handling.

"Finicky" tastes in food often prevent the use of many valuable materials which might be the means of saving money.

Good food habits are an important part of personal hygiene and thrift. Children get such habits by having suitable amounts of suitable foods served to them and then being expected to eat what is set before them.

HONEY RECIPES.

Editor Home Circle: I am sending a few honey recipes for L. L. S., Modesto. I have found that honey can be used in any recipe by remembering that honey can be used for molasses cup for cup using $\frac{1}{4}$ to $\frac{1}{2}$ teaspoon soda if no sour milk is used. Honey can be used cup for cup in place of sugar by leaving out $\frac{1}{4}$ cup of whatever liquid is used in the recipe for every cup of the honey used.

If baking powder is used it should be in addition to enough soda (usually $\frac{1}{4}$ to $\frac{1}{2}$ teaspoon for every cup) to neutralize the acid in the honey. Also watch honey closely when cooking as it burns very easily. I have made these recipes and have found them good.—E. DeV., Lodi.

HONEY CAKE.

One and $\frac{1}{2}$ cup honey, 2 tablespoons butter, $\frac{1}{2}$ cup boiling water, 1 egg, lightly beaten, 2 cups flour, 1 teaspoon soda, 1 teaspoon cinnamon. Beat the honey, butter, egg and dry soda and spice together, add the flour and water and bake in a dripping pan.

HONEY COOKIES.

Three-quarter cup honey, $\frac{1}{2}$ cup sugar, 2 cups or a little more of flour, $\frac{1}{4}$ teaspoon ginger, 1 teaspoon cinnamon, $\frac{1}{2}$ teaspoon cloves, pinch of white pepper, pinch of salt, $\frac{1}{2}$ teaspoon soda, 1 tablespoon of water, 1 cup of chopped nuts. Roll out $\frac{1}{4}$ inch thick and cut with a small cutter. Make very stiff or they will spread too much in the oven.

HONEY DROPS.

One tablespoon honey, $\frac{1}{2}$ cup boiling water, 1 cup sugar, white of egg, $\frac{1}{2}$ teaspoon almond extract, 1 heaping teaspoon butter, nuts if wanted. Boil the honey, water and sugar

until it threads. Pour on the beaten white of egg and beat until cool. Drop from a spoon on oiled paper and put $\frac{1}{2}$ nut on top of each. They should be soft and creamy if the syrup is not cooked too much. Use level measurements and a cup that holds $\frac{1}{2}$ pint.

INFANT MORTALITY.

The Children's Bureau of the United States Department of Labor have just issued a bulletin on the conservation of the life of babies. The statement is made that one in ten of all the babies born in the United States dies in its first year. It was once thought that a high infant rate indicated a greater degree of vigor in the survivors, but now it is agreed that such unfavorable conditions as cause the death of so many infants must also cripple and maim many others and react unfavorably on the health of the whole community.

RAISIN BREAD.

Dissolve half a compressed yeast cake in one-half cup warm water; scald two and a half cups milk; when cool add three tablespoonfuls sugar, one-half teaspoonful salt, shortening the size of an egg, then add the dissolved yeast and flour for a batter. Then add one pound seeded raisins, well floured, and sufficient flour to knead. Knead stiff, let rise, put into pans, let rise again and bake in a steady oven.

POTATO CAKE.

Editor Home Circle—Will some one furnish me a recipe for potato cake?—Mrs. E. M. C., Modoc county.

Beat the yolks of four eggs thick, then add one cup of sugar; continue beating. Beat the whites of four eggs to a stiff froth, then beat with the first mixture. Mix one teaspoonful baking powder with one-half cup of potato flour and sift it into the mixture. Bake it about thirty minutes in a moderate oven.

CACTUS CANDY.

Editor Home Circle. Will you tell me how to make cactus candy?—Mrs. V. W., Riverside.

Most of the cactus candy on sale is really candied cactus, instead of cactus candy. To make cactus candy, take a slab of spineless cactus and make a jelly of it. After set, cut in pieces and roll in powdered sugar or coat with chocolate.

NORFOLK OYSTERS.

Cover bottom of buttered baking dish with $\frac{1}{4}$ cup hot boiled rice, cover rice with $\frac{1}{2}$ pint oysters, pour over $\frac{1}{2}$ cup white sauce, dot with butter and sprinkle with salt and pepper; repeat, using same amount of ingredients. Cover with one cup buttered cracker crumbs and bake in a hot oven 30 minutes.

To make buttonholes in lace, place a tiny square of lawn under the lace where you want the buttonhole and work through it. After completing the buttonhole, cut away the lawn.

Floral Department.

SEASONAL SUGGESTIONS.

CHRYSANTHEMUMS.

Keep on putting in chrysanthemum cuttings till the first of July. Cuttings that were put in in early April will have made root in from three to four weeks. Do not let them remain long in the sand after rooting, or they will grow weak and spindling, and this gives them a check right at the start, and consequently you will have an inferior flower. Plant right from sand into their blooming beds and firm the soil around them; also give a good watering, and also shade for the first two or three days. After they have started growth, give abundance of water, both at the root and on the foliage. You cannot very well over-water them. If you could make an enclosure out of cheese cloth, it would be an ideal place for growing, and the flowers are almost as fine as those grown under glass.

ASTERS.

Asters are in good growth. I am using stable manure where they used shavings from the planing mill for bedding, and it rots quickly and makes an ideal mulch for them. I also use the clear shavings for a mulch for a large variety of plants, and it is the finest mulch I ever used, put on about three-quarters of an inch deep. It can be raked off in the fall and burned, as I do not think it would be of much benefit to the soil to spade it under, as the redwood would take a long time to decay. It might, however, be good for very heavy soils. I have this mulch on sweet peas, and the soil on top under the mulch is as moist after one week as though it had just been watered. It also keeps down weed growth.

PELARGONIUMS.

Pelargoniums are now in their prime. If grown in pots in the greenhouse, they should be lightly shaded and have abundance of air; also watered when the soil on top of the pot looks dry. Do not let them get wilting dry, or you will have inferior blooms. About the first of July move them outside to a shady location and gradually dry them off so the wood will ripen. A lath house is an ideal place for this. It takes a month to six weeks to do this. Never let them get so dry that they drop their foliage. Never under any consideration wet the foliage or flowers, or they will drop their petals, and if the foliage is wet while in strong growth it will in some cases kill the plant by causing it to die back.

FERNS.

Ferns in the greenhouse should now be given more air to harden the new growth, but should be sprayed at least once a day, and the walks on all absorbent surfaces wet, to give out a moist atmosphere. Outside ferneries should be watered and sprayed at least once every day, as they are now in strong growth.

FORTY VARIETIES OF FERNS

in 4-in. pots now ready, 25 cts. each, \$2.50 per dozen. Am booking orders now for choice varieties of CHRYSANTHEMUMS, commercial, show, single and pompons. Forty varieties of PELARGONIUMS in 4-inch pots will soon be in bloom, 25 cts. each, \$2.50 per doz. Also a large variety of other stock. Send for catalog.

**When You Buy
Home Furnishings from Barker
Bros. in Los Angeles You are
Assured QUALITY Goods and
Not "Mail Order" Merchan-
dise.**

Many concerns catering to mail order customers carry what is known to the trade as "mail order goods"—a grade made and designed to meet keen competition and afford highest possible margin of profit at the same time.

With Barker Bros. it is different. Merchandise intended for any kind of sale other than by regular selection on the floors of this store are never selected by Barker Bros., no matter how alluring the wholesale price or how great the possible profit from their sale. Every article distinguished by a place in our stock must first pass rigid inspection and possess the basic element of **QUALITY** which for nearly forty years has been associated with the offerings of this house.

The same high grade goods afforded Los Angeles people are open to the out-of-town buyer with every assurance of satisfaction as though selected in our store in person.

If you cannot visit our store, you will find it distinctly advantageous to buy through our **MAIL ORDER DEPARTMENT**. You are urged to write, telling us just what you want, etc. We will respond quickly, intelligently and courteously. We can save you money on furniture and everything in home furnishings.

Write for our 48-page catalogue of
Draperies, Floor Coverings, etc.,
just off the press.

**WE PREPAY ALL TRANSPORTA-
TION CHARGES** to any railroad, ex-
press or parcel post point in the United
States, within two hundred and fifty
(250) miles of Los Angeles and make
liberal allowance for transportation
charges beyond 250 miles, anywhere in
the world.

Good Health.

[By H. E. Pastor, M. D.]

Action of Seeds on the Digestive Organs.

There are very few fruits and vegetables on the market that, when taken in moderate amounts and thoroughly masticated, will not be well received by the organs of digestion if they are in a normally healthy condition. Of course the fruit or vegetable should be properly matured, and neither under-ripe nor over-ripe. However, if the mucous membrane lining the stomach and the intestinal tract is in an irritable condition from any cause—as a result usually of chronic overeating—this irritated condition may be aggravated and chronic inflammation be set up. Ulceration and even cancer may supervene if the inflammation is allowed to continue indefinitely. Long before these latter lesions are established, however, uncontrollable diarrhoea is likely to set in when hard, rough or pointed seeds of certain fruits or vegetables are ingested, or the fibrous coverings of seeds pass along over these sensitive, inflamed parts. This untoward condition is more likely to occur during the hot summer months, when foodstuffs are liable to be contaminated and when the heat renders the system less tolerant of the results of overeating.

Medical Inspection of Schools.

It is not so many years ago that the public first woke up to the expediency of securing sanitary conditions in public school buildings and grounds, and of examining pupils with a view to ascertaining the presence of physical and mental defects and to applying some form of remedy. This salutary movement has now expanded into efforts to detect in their incipency outbreaks of such contagious diseases as measles, scarlatina, diphtheria, la grippe, and others more or less peculiar to children. It behooves school boards, especially in country districts, having this in mind, to secure teachers who are qualified to recognize the symptoms of children's diseases. By taking proper precautions can they thus prevent the spread of disastrous epidemics.

COOLNESS

There's nothing so cool as an oil stove for summer cooking. All the heat is concentrated on the cooking and not radiated about the kitchen.

Cooks everything any wood or coal range will cook, and cooks it better, because of the steady, evenly-distributed heat.

Use it all the year 'round—more convenient than a wood or coal stove, and more economical.

The long blue chimneys prevent all smoke and smell.

In 1, 2, 3 and 4 burner sizes, with or without ovens. Also cabinet models. Ask your dealer today.

SAVE PAINT DOLLARS

WE CUT YOUR PAINT BILL IN HALF

Do not buy paint until you have seen Color Samples and Prices of our Durable Guaranteed Paint

Get our prices and you will save paint dollars. Buying our paint is like putting money in the bank.

It not only pays good interest, but it will improve your property, both the rental and selling value. Whether your paint requirements are small or large, write to-day for our "Direct From Factory to You" Catalog. It tells how to paint, the amount of paint you will need, the kind of paint to buy, the price you should pay. It tells about Brushes, Varnishes, Varnish Stains, Auto and other Enamels, Wall Tints and Finishes, Roofing, etc.

Write to-day for Paint Catalog—a post card will bring it.
General Paint & Varnish Co. 112 Market Street, San Francisco, Cal.

Normal Hunger.

Hunger proper comes from Nature's demand for sufficient appropriate food to make good the losses resulting from an expenditure of the bodily forces. Where there is loss of appetite it is due to the fact that the system requires no nourishment or is not in a condition to receive and assimilate it. In such cases do not try to stimulate an artificial appetite by the use of bitter drugs or poisonous stimulants, such as strychnine or arsenic. Omit a meal or two where there is no desire for food, and give the jaded digestive organs a rest. Hot water,

sipped in small quantities, has a very cleansing, soothing and tonic effect upon the stomach.

Make work easier in hot weather

President Suspenders for comfort

Every time you move your shoulders the "give and take" feature adjusts with them. Tell your dealer you want **President**. We will repair, replace, or refund money on any pair (if mailed to us) that in any way proves unsatisfactory.

SAN FRANCISCO.

San Francisco, May 16, 1917.

WHEAT.

Wheat prices have shown a steady upward movement during the past week, although the advance during the latter part was not so rapid as during the first three days. This can partly be attributed to the somewhat easier spot situation in the East as the result of continued peace talk. However, local holdings are very light indeed and traders here say that prices cannot drop far. The Russian red variety was offered here this week in quotable quantities, with holders asking \$5.25 per cental.

Sonora wheat, re-cleaned.....None offered
Northern Club.....None offered
California Club, per ctl.....None offered
Northern Bluestem.....\$5.40
Northern Red.....\$5.35
Russian Red.....\$5.25

BARLEY.

Both spot and futures barley declined here during the past week, with trading in the futures end slow and spot sales quiet. While the asked figure on good feed barley dropped 15c a cental here, the big country call which was so noticeable last week was no longer a factor in this market. The necessity for feeding barley to save the lives of the herds in some sections seems to have passed.

Shipping, ctl.....Nominal
Brewing.....Nominal
Choice feed, ctl.....\$2.90

OATS.

But one variety of oats is to be had in this market in quotable amounts at the present time, and there is no very great demand for it. The asked figure is so high that only necessary purchases are made now.

White feed, per ctl.....\$2.85@2.90

BEANS.

With the exception of garbanzos, all varieties of beans were higher in the San Francisco market last week. There was no noticeable increase in the size of the call, but stocks here are getting well cleaned up, forcing prices upward. While there has been very little shipping going on, at present, anyone who has a carload on hand will find little trouble in disposing of it at good prices.

at 10%
Lays, per ctl.....\$11.50@11.75

Mexican Reds.....11.25@12.00
Tepary beans.....None offered
Garbanzos.....\$6.00@7.00

CORN.

There has been a better demand for Egyptian corn during the past week, and the quoted range on this variety narrowed to \$2.25@2.50 per cental. Most of the buyers reported that they were after the grain for seed purposes. California sacked stock remained unchanged, and there is still not enough Eastern yellow on hand to warrant quoting.

(First-hand prices on strictly first-class grain, San Francisco.)
Eastern Yellow, ctl, bulk.....Unsettled
California, sacked.....\$3.45@3.50
Milo Maize.....None offered
Egyptian.....\$4.25@4.50

HAY.

Arrivals of hay last week were confined almost entirely to California stock, with first cutting stock and alfalfa hay forming the bulk of this. Receipts were 1,135 tons, as compared with 1,204 tons for the week previous and 1,220 tons for the week before that. The presence of heavier shipments of California stock in this market has naturally slowed up buyers, and a somewhat easier market on old hay is reported. However, this has yet to take the form of lower prices to the consumer.

Wheat, No. 1.....\$33.00@35.00
No. 2.....28.00@30.00

Alfalfa, new, first cut.....10.00@15.00
Stock hay, new.....10.00@13.00
Straw, per bale.....1.00@1.25

FEEDSTUFFS.

Higher prices on feed stuffs were noted during the past week, although not all offerings of this class were affected. Of the advances noted, all were for \$1 per ton, with bran, coconut cake and meal, rolled barley and rolled oats the articles affected by the change. The jump on coconut cake and meal was put into effect just today, and most of the traders here seem to expect a still further advance.

(Per ton, San Francisco.)
Beet Pulp, per ton.....None offered
Alfalfa meal, per ton.....\$34.00@35.00
Bran, per ton.....48.00@49.00
Oil Cake.....None offered

Rice middlings.....None offered
Rice bran.....35.00@36.00
Shorts.....\$52.00@53.00

POTATOES, ONIONS, ETC.

With the very notable exception of asparagus, the general trend of prices in the vegetable market for the past week has been downward as the result of increased receipts in most lines. "Grass" has been in somewhat lighter arrival, and has also met with a better call from the canners. New potatoes are selling very well at present, with fancy garnets commanding as high as 6c per pound.

Asparagus, per box.....\$1.50@2.25
Peas, per sack.....1.50@2.60
String beans, per lb......6@10c
Wax beans, per lb......7@9c

POULTRY.

The poultrymen of Sonoma county have succeeded in giving the local produce merchants something to think about. Last week very heavy receipts of small white leghorn hens from that section were noted, with the high price of feed advanced as the cause for selling these fowl. This week the price of feed again advanced, but the Sonoma poultrymen suddenly stopped sending in these hens, and prices on this offering gained a cent per pound. This was about the only change in the poultry list, with other grades barely steady under good sized offerings.

BUTTER.

Butter quotations closed the week just two cents above the opening figures, in face of increased receipts. A sudden revival of shipping was responsible for the stiffer market, and those dealers who had been nearly ready to start storing for winter trade have again postponed. The East bought quite freely here, two houses are filling large government orders and there was again a big call from Los Angeles.

Thu. Fri. Sat. Mon. Tu. Wed.
Extras.....35½ 35 34 35 36½ 37

EGGS.

There is to be apparently no halt in the upward march of egg prices, as the various grades showed net gains of from a half to two cents per dozen the past week. Storage activities have formed a good share of current business with buying for shipment to Alaska also contributing to total trading. Storage holdings at present are 87,000 cases, or more than 14,000 cases more than were held at same time last year. As Los Angeles is reported to have some 13,000 cases more than last year, it can be estimated that California icehouses have at least 45,000 cases of eggs more than were held at the same date last year.

BERRIES.

Blackberries and gooseberries were added to the quotation list, and the receipts of the first loganberries and raspberries from Los Angeles foreshadow further additions to the berry list for next week. Both of the last named offering sold at \$1.50@2.00 per 15-basket crate. The California Packing Corporation has increased its price on strawberries to 4½ cents per pound, and an independent syrup making concern was paying 6 cents several days last week. A minimum price of \$4.50 per chest has been named to the trade.

Special Citrus Market Report

Los Angeles, May 15, 1917.

Shipments of citrus fruits from Southern California from November 1 to May 7: Oranges, 22,839 cars, and lemons, 3,875 cars. Same time last year: Oranges, 19,283 cars, and lemons, 3,111 cars.

Shipments from Central California from November 1 to May 7: Oranges, 4,064 cars, and lemons, 164 cars. Same time last season: Oranges, 4,807 cars, and lemons, 146 cars.

Shipments from Northern California from November 1 to May 7: Oranges, 845 cars, and lemons, none. Same time last season: Oranges 610 cars, and lemons, 1 car.

There was more life to the eastern markets the past week and all good fruit sold a little better. Locally the market was very dull. Too many cheap berries and other fruits on the market for the good of the orange trade. But while sales were slow and light, prices were held steady. Local packers paying 14¢ per pound, in the grove picked, for oranges.

Grape fruit draggy at 1½@2c per pound in the grove, picked. Lemons in good supply and sales very slow. Local packers paying ¾@1c per pound in the grove, picked, for the best.

AUCTION SALES.

New York, May 14.—Sales fifty-three cars navels; two cars seedlings, two cars mixed navels and bloods and four cars lemons. Demand for oranges very active and prices higher, particularly small sizes. Lemons active. Prices 10@15c higher. Navels averaged \$1.85@3.13. Seedlings averaged \$1.95@2.15. Bloods—halves averaged \$1.05 @1.38. Lemons averaged \$2.30@2.92.

Boston, May 8.—Thirty-one cars oranges sold. Market doing better on both oranges and lemons. Navels averaged \$1.45@3.35. Lemons averaged \$1.25@3.65.

Philadelphia, May 8.—Twelve cars oranges and one car of lemons sold. Market unchanged on oranges and lemons. Navels averaged \$1.50@2.80. Lemons averaged \$2.80@3.05.

KEEP COOL—POULTRY KEEPING STILL PROFITABLE!

In our issue of May 12 a statement appeared regarding the present serious situation of California poultrymen. This item brought forth protests from parties who have been identified for many years with the poultry industry of the State. It is pointed out by these protestants that the fiscal year of poultry-keeping runs from September 1 to August 31, and that poultry farmers who have properly fed and cared for their flocks and who will continue to do so until next September will find this season to be as profitable as the average year, or even a little better.

In regard to the price of feed: It is natural that we shall have high prices, but the present prices are unreasonable, and will be reduced undoubtedly. At the same time, the prices of eggs and poultry will be about as much above those of former years as will the increased cost of feed. When the prices of grains fall and a sane market value is established, reserved stocks will be offered. On the Pacific Coast we have no more feedstuffs than we need, but with care and proper distribution there is ample to carry poultry and other livestock until next harvest.

BUTTER.

Receipts of week ending May 15.....316,790
Receipts of same week last year.....330,330
A steady and fair consumptive demand was had the past week. Receipts were somewhat better than the week before and much the same as last year. Market, however, held steady at 34c for extras. There was no speculative buying on change, however, and an increase in the cold storage stocks for the week of 26,633 pounds show that the trade failed to take all of the receipts. There are now in cold storage here 59,850 pounds more butter than this time last year. The government's report of stocks in cold storage May 1 shows that 281 firms held 2,586,593 pounds of butter, about double last year's supply. Under this influence and a better production in the Central West and East, extra creamery butter went off 1c in Chicago up to Monday, closing at 37c, and New York lost 2c, closing at 38c for extras. Tuesday the market here was bid up 1c on call, but there was no trading. This was as far as buyers cared to go, while holders in the face of the sharp advance north refused to sell.

EGGS.

Receipts (railroads) for week ending May 15, 1917, 3,415 cases.
Receipts (railroads) for week ending May 15, 1916, 3,702 cases.

There was more life and a stronger tone to this market the past week. Receipts continue to run lighter than a year ago. This, with the government's report of May 1 showing that the holdings in cold storage of 350 firms were nearly 600,000 cases lighter than the same date last year, and the continued selling off of many hens by local poultry people gave more confidence in the future market and caused some buying to go into cold storage even at the high prices, which were 10c above last year's figures at this time. The consumptive demand, however, was not heavy, prices being too high for a free consumption of eggs.

POULTRY.

A slow and weak market was had the past week. Broilers are coming in quite freely and the market for them is weak at last week's decline. Fryers are less active and have declined 1c. Light hens are also draggy and weak, a good many coming in. Heavy hens hold their own, and sell very well. More ducks coming in and are dull and lower. Turkeys steady but slow sale. Roasters in fair demand.

We quote from growers:
Broilers, 1½ to 2 lbs.....29@21c
Fryers, 2½ to 3 lbs.....21
Hens over 4 lbs.....18@19c
Hens under 4 lbs.....14@15c
Ducks.....15@16c
Geese.....15c
Roosters, 3 lbs. up (soft bones).....26c
Turkeys, heavy, 12 lbs. and up.....29@30c
Turkeys, light.....24@25c
Squabs, live, per doz.....\$1.50@3.00
Dressed.....3.75@4.85

BERRIES.

Market was well supplied the past week and prices worked lower both on blackberries and raspberries that are coming in more freely. Strawberries also weak, but best of them sold much the same as last week. Offerings were not only liberal but quality generally good. Demand fairly active at the prices.

We quote from growers:
Strawberries, poor to choice, 30-basket crate.....90@95c
do Fancy, 30-basket crate.....\$1.10@1.15
Blackberries, per 30-basket crate.....\$2.50@2.75
Raspberries, per 30-basket crate.....2.50@2.75

NEW VEGETABLES.

Summer vegetables are coming in more freely and with increased offerings prices are working lower. And with the decline the demand has improved. If cabbage and asparagus be excepted, everything is lower. Cabbage coming in less freely and under a very good shipping demand held its own. Asparagus, too, showed a falling off in receipts and was advanced a little.

Cabbage, per cwt.....\$2.00@2.25
Asparagus, per lb, local and northern.....4@5c
New potatoes, per lb.....3½@4c
Peas, per lb.....3½@4½c

Nevada, year's35 @ 40c

Los Angeles, May 15, 1917.
CATTLE.—The market remains much the same as a week ago. The country is offering cattle quite freely and holders rather anxious to sell. But as eastern markets continue high, prices while weak, were notably unchanged. California and Arizona furnished most of the supply and there were quite a number of grass steers in and they were in very good condition, better than last year. Fed steers continue to show the influence of the high price of feed.

A good many calves were offered during the week and they were dull and weak.
Per cwt. f. o. b. Los Angeles:
Beef steers, 1000 to 1100 lbs.\$9.50 @ 10.00
Prime cows and heifers7.50 @ 8.00

shipping inquiry is being had from the country for new hay, but the city is buying sparingly. Dairy people are buying but little hay, using mostly green alfalfa. Market both slow and weak.

We quote f. o. b. Los Angeles:
Barley hay, ton\$21.00 @ 23.00
Oat hay, ton22.00 @ 24.00
Alfalfa, northern, per ton18.00 @ 19.00
Alfalfa, local, ton20.00 @ 21.00
Straw, ton11.00 @ 12.00

BEANS.
Market was very quiet the past week. There was some little buying for seed, but trade took very few beans. High prices causing the consuming trade to hold out of the market, and where holders tried to force sales they had to yield concessions. But as we are in the midst of seeding, most holders were independent.

We quote from growers:
Limas18c
Large white17c
Small white17c
Pinks13c
Blackeyes12 @ 12 1/2 c

HONEY.
Warmer weather of late and more sunshine have favored the bees and they are making more honey. Reports from the country say that some orange honey is being extracted, but no sales reported as yet. It is thought that enough honey will be made by the end of the month for the market to open, and a 10c market to the producer for orange honey is looked for, which is 2 1/2c higher than last year.

Publisher's Department.

In the advertisement of The Williams Patent Crusher and Pulverizer Co., Inc., in last week's issue, the address was given 67 First street. The correct address is 67 Second street, San Francisco.

"Regarding the special Swine Edition of the Rural Press, I enjoyed it very much and received a great deal of good from it. The paper was nicely gotten up and showed a great deal of work. It should do much good to the breeders of California."—N. Hauck, Alton.

The number of new paid subscribers added to our list during the last two weeks was 492. We confidently expect our field men to increase this number of new patrons from now on.

"Your special Swine Number was splendid and I wish to express my appreciation of same. I experienced much pleasure and profit from its perusal. It is certainly educational."—Chas. R. Hanna, Riverside.

"Productive Dairying," by R. M. Washburn, professor of animal husbandry, University of Minnesota, is a new book just published by the Lippincott Co. of Philadelphia. It contains 432 pages, 131 illustrations, is cloth bound and sells for \$1.75 net. The work covers the dairy breeds, winter feeding, clean milk production, farm

Good cows and heifers7.00 @ 7.50
Calves8.00 @ 9.00
HOGS.—While a fair demand was had the past week there was no snap to the market. A good many light half fat hogs arrived from California and Arizona and such were taken by killers at old prices. But few really fat grain fed hogs in and what arriving found ready sale and brought a good premium over light half fat hogs, that made up most of the receipts.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 250 @ 300 lbs.\$11.50 @ 12.00
Mixed, 200 @ 250 lbs.12.00 @ 13.00
Light, 175 @ 200 lbs.12.00 @ 13.00
Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP.—Market again slow. Killers taking fewer sheep and lambs than previous years. The high prices at which they are held, and killers forced to pay, making mutton and lamb so high that it is selling less freely. But while the demand was only fair, the high markets east had a sympathetic influence and enabled feeders to hold prices steady.

Per cwt. f. o. b. Los Angeles:
Prime wethers\$ 9.00 @ 10.00
Prime ewes8.50 @ 9.00
Yearlings10.50 @ 11.00
Lambs13.00 @ 14.00

North Portland, Ore., May 14, 1917.
CATTLE.—Today's cattle market was rather a slow affair, with about 1000 head in the pens, demand from packers was limited, due to heavy purchases made last week, when there was a very good demand from out of town butchers, and took quite a string at steady prices, although the bulk of today's sales were on regularly lower basis, ranging from \$10.00 to \$10.50. Medium grades of beef were the best sellers at steady prices, while prime steers sold 25c lower. Common beef that is dairy bred stuff suffered a loss of 50 cents. Several loads of prime heavy steers brought \$10.85, which was the top, with good light steers at \$10.25 to \$10.50; medium grade sold around \$9.75 to \$10.00, with common steers down to \$8.00. There were only a few cows here, the best getting \$9.25 to \$9.50, with common stuff selling down to \$5.00. Best light veal calves sold at \$10.00; a bunch of baby beef heifers brought \$10.00. The general trend of the cattle market was slow.

HOGS.—Hog prices ranged mostly 10 to 15 cents higher, the top was \$16.00 for three loads, with another load at \$15.85, the bulk of sales were made at \$16.65 to \$16.75, with a few light loads down to \$15.50. Pigs suffered a severe setback of about 75 cents, due to the heavy receipts of light hogs during the last few weeks, the bulk going at \$13.00.

SHEEP.—The sheep market is unchanged, there were only a couple loads of mixed valley sheep here.

and market dairying, and a valuable appendix of tables.

A New Book—"Home Labor Saving Devices," by Rea C. Scott; illustrated; published by J. B. Lippincott Co., Philadelphia; price \$1 net. This book is a handy volume of value to the woman, no matter what device is needed in the home, whether an iceless refrigerator, a porch swing or a shower bath. It gives detailed plans for making articles used in the kitchen, dining room, porch or miscellaneous. Also many labor saving devices to do with poultry and dairy houses.

Frank Honeywell, publisher of the Pacific Rural Press, passed through town Tuesday on his annual tour of the northern part of the State investigating crop conditions. He stopped over an hour to interview some of the leading farmers and to pay the Herald office a call. We are always glad to meet Mr. Honeywell. He is a genial gentleman and is the "live wire" of the agricultural press of California. He is publishing an excellent paper and he has brought it closer to the farmer and his family during his managership than has ever been done in the many years the Press has been published. The farmers have shown their appreciation in a practical manner, as the paper has a larger circulation at present than at any time in its career.—Livermore Herald.

How I Saved My Apricot Crop This Spring

[Written for Pacific Rural Press by Ralph Thomas, Watsonville.]

THE COLD SPRING just passed has been extremely severe on deciduous fruits and especially so on the apricot. Practically speaking, there is not an apricot left in the floor of the valley in this section, excepting on one five-acre orchard. This is the orchard wherein I did my smudging.

When I first thought of using smudge-pots I consulted several growers here who had used them. Every one of these growers gave me the "oh, fudge" smile and the "forget it" shrug of the shoulder. A manufacturer of smudge-pots sent me his circular on "how to do it." I classed this manufacturer with the average one and divided his claims by two. My mental status on frost prevention at this time was very much unsettled. However, I purchased 200 two-gallon pots of the lard-pail type. These had covers and deflectors. The deflectors I never used, as it was impossible to light the pots with them in place. A friend gave me 150 smaller pots that he had used once and then thrown away with a "never again" oath. This gave me 350 pots for my 418 trees—six-year-old Tiltons. So it was that I went into the frost prevention game with a half-heart—a half-heart that cost me some of my crop.

I placed the pots in the center of the rows—each pot equidistant from each tree in a square of four. This scheme takes one pot for each tree. I did not have pots enough to carry out this scheme over the entire orchard, so in the center the pots were less numerous. An oil man advised me to use stove distillate. I put 300 gallons of it into my 350 pots at a cost of \$16.50. I then waited for King Frost.

When the first cold night came, dropping the thermometer to 27 degrees F., the trees were in the first days of blooming. I did not light the pots that night and as a consequence lost a large percentage of the early blossoms.

The next cold night came while the trees were in full bloom. I stayed up all night, thinking that I might not hear my Big Ben. At 4 a. m. the thermometer fell to 30 degrees. I got busy. Someone had told me to sprinkle a small quantity of gasoline into the pots to facilitate the lighting. This we did. Our torches, made of burlap wired onto

iron bars, were dipped in kerosene. The first night's lighting was not a complete success. A previous flood had turned over some of the pots in one section of the orchard, while rain had partly filled some of the uncovered pots. Nevertheless, with all the available pots burning, a thermometer in the center of the orchard registered 31 degrees, while one outside the orchard registered 26 degrees. I lost about half the blossoms in the section where the pots had been turned over by the flood. From this time on I began to take the work more seriously.

I observed that there was a difference of from 5 to 7 degrees between the porch where I slept and the orchard. By deducting 6 per cent from my bedside thermometer, I was saved many cold trips to the orchard. I set my alarm at 2 o'clock and could usually tell at that time whether or not it would be a dangerous morning.

The next cold morning—and it was very cold—an east wind blew the heat from the pots at right angles and the crop on the two outside rows was lost. By all means a double row of pots should be placed on the outside row.

The next cold night, less cold, however, than the previous nights I had smudged, I burned but one-quarter of the pots. The next cold night I lit one-half the pots. By this time carbon had formed inside the pots and the use of gasoline as a primer was unnecessary. We learned, too, that it was best to light a quarter of the pots at a time. This practice permitted us to cover the orchard in less time, thereby starting the temperature to rise over the entire orchard before frost damage could be done.

At the next lighting I used one-third of the pots, and failed to refill them the next day, thinking that I could "get by" with what oil I had. Right here is where I made a serious mistake, for within a few days came the fatal morning of April 16. The cots had just shed their jackets, and as yet there was little foliage to protect them. Although on this particular morning I commenced to light the pots at 2 o'clock, I was handicapped by a lack of oil and pots. Many of my old pots by

(Continued on page 647.)

How Californians use sunshine to serve the world with apricots. The illustration shows one of the ways in which an apricot crop is made valuable and imperishable after the foresight of the grower has helped the trees to produce it.

A RATIONAL APPEAL TO FARMERS.

LOUd and clear and free from the hysterical variations which make it hard for the ear to surely catch the theme of the farmers' patriotic duty and opportunity, there rings out now and then the voice of the President of the United States carrying the motif directly to hearts attune and responsive. On May 19 President Wilson made this public declaration:

I have thought it necessary to ask Congress to put in my hands very great powers with regard to our food supplies.

Those powers are very great, indeed; but they are no greater than it has proved necessary to lodge in the other governments which are conducting this momentous war, and their object is stimulation and conservation, not arbitrary restraint or injurious interference with the normal processes of production. They are intended to benefit and assist the farmer and all those who play a legitimate part in the preparation, distribution and marketing of foodstuffs.

The objects sought to be served by the legislation asked for are: Full inquiry into the existing available stocks of foodstuffs and into costs and practices of the various food producing and distributing trades; the prevention of all unwarranted hoarding of every kind and of the control of food stuffs by persons who are not in any legitimate sense producers, dealers or traders; the requisitioning, when necessary for the public use, of food supplies and of the equipment necessary for handling them properly; the licensing of wholesome and legitimate mixtures and milling percentages, and the prohibition of the unnecessary or wasteful use of foods. Authority is asked also to establish prices—but not in order to limit the profits of the farmers, but only to guarantee to them when necessary a minimum price which will insure them a profit where they are asked to attempt new crops, and to secure the consumer against extortion by breaking up corners and attempts at speculation, when they occur, by fixing temporarily a reasonable price at which middlemen must sell.

WHAT THE PRESIDENT ASKS IS THE FARMERS' NEED.

IT IS impossible to predict how much of the list of powers, which the President asks for, Congress will come through with. There will probably be a thousand cords of talk about that, and this will itself be a good thing, while the crops are still growing and we are trying to knock together some ships to put them into. When the American people has leisure it can talk—all the way from the rural fence corner to the floors of Congress, and when the nation gets into a good talk you can never tell what it will bring out of it—therefore we do not get scared when the politicians rage and the voters imagine a vain thing. Both are generally better in the end for the exercise of their wits; besides it is not up to us to hold forth upon war needs and broad statesmanship. We do, however, find great satisfaction in contemplating the powers President Wilson asks for, because we conceive the products of such powers to be fundamental and essential to the interests of agriculture and to the attainment of fairness in the relation of the farmer to all other men. Therefore we rejoice at the thought of such

powers being exercised as a war measure: not only because of patriotic purposes involved but because a successful try at them will afford a demonstration that they are right and essential to the development of agriculture in its proper relation to other interests of mankind and productive of farming success and prosperity because such relations are recognized and enforced.

President Wilson desires power to know what foods exist, where they are, and what are the purposes of those who are holding them. This is exactly what every farmer needs to know, that he may judge what his product is worth at any time, price it himself and not be forced to take prices fixed by manipulators.

President Wilson desires power to remove control of foods from speculators who have no legitimate connection with producing or distributing it. This is exactly what real producers and fair traders need to have done.

President Wilson desires power to fix minimum prices so that labor and capital speeded into production shall not be lost. This is manifestly a war measure and of temporary application, and yet it is clearly a movement to fix prices upon the basis of the cost of production, and such a movement once under way will never stop until recognized and established.

President Wilson desires power to fix maximum prices—for the reasons which he himself clearly states. This is also a safeguard of ample and continuous prosperity to producers, because it tends toward maximum consumption at a fair profit to them.

SEERS VS. PINHEADS.

THE PEOPLE of the United States rightly hold the entry of this country into the great war to be a matter of vision and that is the reason they rise to it with such alacrity and enthusiasm. It is obviously essential that this vision shall not be clouded by a sky-full of mackerel—small political fish which should always be salted and barreled when great issues arise. Power to do this is what President Wilson asks of Congress. He has had experience enough with the pinhead propositions for national attitude and behavior and the people have had experience enough with pinhead propositions for increasing production by making the real farming interests subsidiary to back-yard and child-labor farming, which are desirable in their little ways but otherwise dreams and fallacies which have driven the country into hysteria of fear and hoarding. Farming is a business for grown-up and trained men and women—with the children, of course, growing into their places and with untrained and inexperienced adults breaking in as they can. It is the function of the pinhead to entirely reverse this natural order and the President wearies of them. He needs a man with vision and asks Congress that the powers over distribution and consumption, over exports, imports, prices, purchase and requisition of commodities, storing and the like, which may require regulation during the war, be placed in the hands of a commissioner of food administration appointed by the President and directly responsible to him.

CALIFORNIA THE HOME OF SEERS.

WE ARE, of course, not surprised that when President Wilson needs a seer he picks a Californian. California holds the record for long-distance and penetrating vision, for her people grow up that way, but they usually have to beat the world before they can rise above the barriers in their own country. It is traditionally that way with real prophets. It was that way with David Lubin, who was buffeted out of his own country by the Washington bureaucrats and compelled to take the sky from Italy in order to revise the financing of farming in his own country which is now largely accomplished because of his vision. It is the same with Herbert C. Hoover, whom the world recognizes as the savior of Belgium after the Kaiser ran the juggernaut of German ambition over the country. And it is Hoover upon whom the President calls to lift him above the political entanglements at Washington so that he can get a clear sight of what this country

ought to do for the food-strength of her own people and the food-strength to win the war for humanity in Europe. It is a grand thing for California to produce men who have worked so well for themselves that they can give service to their country and ask no compensation save the consciousness of doing their duty, and thus match what the patriots of other States are now doing. For President Wilson says of Mr. Hoover:

I have asked Herbert Hoover to undertake this all-important task of food administration. He has expressed his willingness to do so on condition that he is to receive no payment for his services, and that the whole of the force under him, exclusive of clerical assistance, shall be employed so far as possible upon the same volunteer basis. He has expressed his confidence that this difficult matter can be successfully accomplished through the voluntary co-operation and direction of legitimate distributors of foodstuffs and with the help of the women of the country.

And since the above was written another Californian, President Wilbur of Stanford University, has gone East for a term of unsalaried association with Mr. Hoover in the food administration work. Such voluntary service is only for the duration of the war and will not increase the political furniture of the country, for the President says: "There need be no fear of the possibility of a permanent bureaucracy arising out of it." He is quite right, for bureaucrats do not work for nothing and board themselves. And yet, though there will be no increase of the stated governmental machinery, there will be a permanent demonstration of great value in governmental principle in connection with food production, as has been already suggested.

LET PEDRO HELP!

WE HOPE the war will harmonize European nations upon the basis of representative self-government and in that way make all the world akin in devotion to popular rights and privileges. But whether this end, devotedly to be hoped for, is attained or not, it seems to be beyond question that it will hasten the unification of the Americas in more confident support of government by participation of the governed and in resolute resistance to the intrusion of autocratic interests upon this hemisphere. Disclosures made during the last few weeks show that we have already had very narrow escapes from German intrusion and still have a future to protect from it. If any autocracies survive the current European convulsion, they will be powerless to intrude, for the war will make our Monroe doctrine a pan-American principle. A solidified America will be, in defense of popular liberty, the bulwark of a reconstructed Europe. In the immediate effort toward this end, John Barrett, director of the Pan-American Union, shows as the result of a special investigation that the twenty countries of Central and South America exported in 1916 to the United States and Europe foods valued at \$774,000,000. The total includes beef, 104 millions; grains, 160 millions; sugar, 271 millions; coffee, 191 millions; chocolate, 35 millions, etc. And Mr. Barrett holds that the Latin American countries will be able to take care of and provide against that very shortage in the production of the United States and its allies which might be fatal in an ultimate crisis. To this end immediate action should be taken by the United States in aiding the countries of Latin America to increase their food production and to develop their vast unused fertile areas. If necessary and desired, they should be supplied with the necessary capital, agricultural experts and engineers to accomplish these ends. It surely looks like a good proposition.

THE WILDERNESS IS FOR MOSES.

THERE seems to be no reason to apprehend that the spur now being applied to food production will cause too great a jump in supplies which are able to bear the cost of long transportation. These are obviously such things as preserved fruits, dairy and packing house products and flour and feed grains, including legumes. The first two of these groups cannot be increased very quickly, the last group is cheaply moved around the world—when there are ships enough—

and such products can as easily be gone out of as into, if land and water give wide suitability, which is not the case with orchard and animal products, which admit no apprehension of over-supply, whether the future be of war or peace. Of other products we are not so sure. Of bread grains, for instance, Europe, which is the only market for surpluses from all the world, is likely, as soon as the war-cloud lifts, either to grow more than before the war or to consume less, or both—for Europe has had hard lessons in both lines and will have learned them well. In the matter of grains, therefore, it has been wise to make all the crop we can this year and next fall we ought to be able to judge whether we should do it again or trust less to distant demand for the grain crop and therefore grow less of it, unless we can see the livestock which can turn it into higher value. Grains of all kinds are likely to soon fall as rapidly but perhaps not as far as they have recently risen. For this, and because crop changes are few, we come to doubt whether the current exhortation to send out and stake men upon the

arid lands to do dry farming for patriotism is any wiser than it was a few years ago to do the same thing for speculation. For grain growing undertaken by assisted farmers in the arid region is much like the manna-gathering of the Israelites in the wilderness of Sinai. The record shows that manna might either disappear when the sun rose, or, if successfully gathered and stored by early risers, it might become hateful because valueless. Therefore, it seems to us unwise and often cruel to spread untried persons upon dry-farming enterprises, which they are apt not to understand, and to encourage them by loans to go into such dangerous situations in which they are apt to lose all they have and all they borrow. The people who can be trusted in such undertakings are those of experience in the districts where these lands are, and they are not the ones who are reached by a general propaganda. The taking up of such lands should not be made too easy. It is only for those who have cut their eye-teeth and grown cork soles on their feet. Too fast an uplift in this line may cause much disappointment and loss.

wants millets at all. For ordinary summer-grown forage and for grain, the non-saccharine sorghums are better growers and producers than any millet we know of.

Ants Accessory, Not Principals.

To the Editor: I have a nice garden, but the small red ants are killing potatoes, peas and beans. I have tried drowning them, but they work the same in moist ground as in dry.—G., Fresno.

Ants do not directly injure plants. There is an insect called a "white ant" or termite (which entomologically is not an ant at all) which is destructive to plants. Common ants infest plants because some other insect, which gives substances upon which ants feed, is present. This is usually an aphid or plant louse, and when ants are abundant on the plant it generally means that plant lice are present. See if you cannot find the reason why the ants are giving your plants so much attention.

About Root Knots.

To the Editor: I have apricot trees, one to three years old, affected with black knob or crown gall. They look well, but I am thinking of digging them all up and re-setting. Will I have the same trouble, by putting in new trees in the same holes, or is the disease in the trees themselves? The ground is comparatively new, having been cleared from oak and chaparral brush four or five years ago. Is there any precaution in the way of disinfecting ground before replanting? Would it be worth while to doctor these trees?—Z. P., Santa Clara.

When the tree is making a good growth it shows that it has a start of the knots. In such a case remove the knots with a chisel without injury to adjacent bark, cover the wound with Bordeaux paste and let the tree grow. If the growth is much reduced it shows that the knots have the start of the tree. Dig it out, throwing the soil toward the middles and plant a new tree in fresh soil. This tree will have to run the gauntlet of the same trouble and must be watched and treated in the same way. The disease may be either in the tree or in the soil or in both. No disinfection is needed in replanting small trees if a good hole is dug out and filled with new soil. In removing large trees use plenty of lime and leave the holes open to air and rains for a few weeks. This should be done in the summer or early autumn preceding planting time, and new trees planted in fresh soil from a distance. Of course, in an entire replanting strike the new rows down the middles or, if this is not desirable, change the spacing to bring the new trees between the places previously occupied.

Plowing Under Stubble.

To the Editor: Is it beneficial to plow under the stubble of a hay crop, so that a barley crop can be quickly put in with a cultivator after the early rains?—R., Newark.

If the soil is moist enough to rot the stubble, there is a distinct gain. If not, the rubbish in the soil will make the early rain less effective in starting a new crop which will hold on during the usual fall drouth. Therefore it is better to feed down and break up the stubble finely; or, if you have no stock to do this, it is better to burn it off before you do the dry-plowing. Plowing and harrowing after harvesting acts, of course, like a short summer-fallow and holds some soil moisture from evaporation and thus helps the coming crop. But to put on hay or grain on dry-plowed land is not good practice if the land is foul. In that case the best use to make of the early rain is to start a weed crop to be plowed under in the fall.

California Weather Record

The following rainfall and temperature record is furnished the PACIFIC RURAL PRESS by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., May 22, 1917:

Stations—	Rainfall Data.		Temperature	
	Past Week.	Seasonal To Date.	Normal To Date.	Data. Max'm. Min'm.
Eureka51	31.25	44.28	68 40
Red Bluff83	17.94	24.30	80 42
Sacramento04	12.88	19.77	78 42
San Francisco02	15.76	21.92	64 48

QUERIES AND REPLIES

Inquirer Must
Give Full Name
and Address

Hoplias Eating Green Peaches.

To the Editor: I am sending pests I found in my peach orchard. Some of my neighbors, who have been orchardists for years, say they may be new. I would be glad to learn what this is and what I can do for it.—R. C. T., Atwater.

The insect is hoplia pubicollis, discussed last week for its injury to grape vines and garden flowers. The specimens show that it also has the habit of drifting into young peaches. We have not seen this before. The insect has cropped out now and then in the valley vineyards for the last forty years or more. Fortunately it does not occur widely nor does it stay very long, but, according to the specimens, it has the power of ruining a peach crop if abundant enough. Spraying with arsenate of lead is the way to protect the plant.

Our "Laurel" Is Not the "Sweet Bay."

To the Editor: One of our cooking instructors is stating that the California laurel is the tree which supplies "bay leaves" for commerce for the use of cooks, but my observation is that our laurel leaves do not answer the same purpose. How can you account for it?—Pupil, San Francisco.

The "sweet bay" tree, which has been used from most ancient times for wreaths for poets and warriors, and to this day gives its fragrant leaves for cookery and confectionery, is Laurus nobilis, which is native to the Mediterranean region. The so-called "California laurel" is a different tree: its botanical name is Umbellularia Californica and it is native to this State, as its name indicates. The aromatic quality of its leaves is also different from that of the "sweet bay" and less desirable. It may remove some misapprehension to add that neither of these trees is the source of "bay rum," which is made from another tree, Pimenta acris, a native of the West Indies and northern South America.

Weights of Near-Ripe and Full-Ripe Peaches.

To the Editor: Will you please tell me, through the Press, the difference in weight between Muir peaches as they are picked for the cannery and when dead ripe as picked for drying? I wish to determine whether drying would bring a better return than selling green to cannery after making the proper expense accounts of each.—Grower, Live Oak.

We have no comparative weighings from which to draw an answer to the question. It is, however, a matter of wide interest and we hope readers will submit points from their experience for publication. The full answer involves not only the added weight by full ripening, but how much of that gain is realized in the properly dried product. All careful observations along the line will be important to record for the public benefit.

Topping Grape Vines.

To the Editor: Why is it necessary to top Thompson seedless vines, and when is the proper time to top them?—A. W. N., Fresno.

* We are not ready to admit that it is necessary:

it is, however, often desirable. It may increase the size of the berries and it may help to shade them by inducing growth of leafy laterals. It may also prevent the vine from pulling open by the weight of long canes and thus preserve more desirable and convenient form. It may reduce somewhat the vegetative growth of too rank vines and for this reason should not be overdone. It may be quite undesirable on weak vines. Fruiting canes should not be topped too near the fruit: several leaves should be saved. It should be done rather early, say in June. The later it is done in the active season of growth the more it weakens the vine for the following year.

Gypsum on Young Alfalfa.

To the Editor: I have young alfalfa, sown this year, and have recently irrigated it. A hard crust has formed on it. Would you advise sowing gypsum before irrigating again?—H. S., Fresno.

It would stimulate the plant and improve the soil surface somewhat.

Wind and Vine-Sulphuring.

To the Editor: Will it do any good to sulphur on a windy day? Is it absolutely necessary to sulphur on a quiet and warm day? Which kills the mildew, the sulphur or the fumes from the sulphur?—A. W. N., Fresno.

It will surely do some good, though your neighbors may get it. You can best answer as to whether it is necessary to sulphur on a windy day when you get a good eyeful of sulphur. A quiet, warm day is prescribed because then the sulphur will settle down closest to its job and reach highest efficiency. It is the fumes which attack the mildew, but the closer the sulphur is to its work the harder the fumes hit. The old idea of sulphuring the ground to get the fumes on the vine has, if we are not mistaken, been abandoned as wasteful and inefficient.

To Speed Up Peaches.

To the Editor: Would nitrate of soda and superphosphate applied to Muir peaches as you recommend for apricots, in your issue of April 28, give the same results? The trees were irrigated ten days ago and except for this purpose I should not water again for a month. Would it be nearly as good simply to cultivate the fertilizer in?—S. S. S., Sanger.

Yes; working these soluble substances into moist ground by cultivation will set them at work and the next irrigation will extend their operation.

German Millet Not Approved.

To the Editor: Can you tell what kind of a grower German millet is, and how to plant it, and at what time?—M. T., Fresno.

We speak not from war prejudice but from facts, apparently demonstrated long ago, that German millet is a poor affair for California. It is a strange coincidence that our allies, Italian and Japanese millet, are both much better, if one

A California Colonist's Successful Struggle

[Written for Pacific Rural Press.]

OBLIVION is strewn with the wrecks of strong-hearted farming enthusiasts, of greater faith in real estate men's interpretation of land values than of good farm sense. And Oblivion is still accumulating such wrecks. That C. W. Carter and his family of the Los Molinos colony are not among them is due principally to the hard work of himself, his wife, and boy. They paid down their entire small capital on the five-acre farm and for fruit trees to plant on it. They had come from the Central West broken in health and practically broken in pocketbook. They had been renting for years; had knocked about from pillar to post, and were tired of it. They came here to make a home.

There was a house on the place, and Mr. Carter went to work for the Los Molinos Land Co. to earn the necessary daily bread while his wife and children farmed the place. He was carpentering in town the day we called at the farm recently, and the following story was told by his little wife, who has gained buoyant health, bright eyes and the weather tan which betokens where she got her health. Their son Merrill is a strapping lad about sixteen, fortunate in being still busied with growing things instead of coffin nails and billiard cues.

"We paid \$375 on the place when we came here five years ago," says Mrs. Carter. "We have paid \$200 per year since then, and have only \$400 yet to pay. You see the place is mostly set to fruit and nut trees, with just enough alfalfa to keep our horse and cow. We wouldn't take \$500 an acre for it now. We are going to get a Rural Credits loan to put down a well and improve the house. We'll have running water in the house, bath and all other conveniences that running water will give. We will also buy an auto truck, for the horse is too slow to deliver our vegetables. There is so much work to do here that we cannot afford to have one of us wasting six hours to deliver a load of vegetables when our boy with an auto truck will do it in half that time. We have done all our own work and have used only one horse except for spring plowing, when we had to hire a horse."

RECORDS OF INCOME AND EXPENSE.

Not the smallest factor in the Carters' success is their system of keeping accounts. Each day's receipts are set down in detail in their account book, showing quantity and kind of fruit or vegetable, to whom sold, and the price. On the opposite page are set down the "disbursements" in similar detail.

"In case of dispute with the Association through which we ship fruit and vegetables, we refer to our books. There have been some difficulties between the Association and other folks, but we have had no trouble."

MARKETING AND RECEIPTS.

Vegetables have been the chief source of income. Enough have been traded at the store to keep the balance in favor of the Carters. They have had a regular produce wagon route to Los Molinos and Tehama, often carrying vegetables to Gerber,

Proberta and Red Bluff. They are members of the Los Molinos Canning and Shipping Association, which includes about forty farmers, and has been operating two years.

"The Association has been fairly successful," says Mrs. Carter. "It has helped solve our biggest problem—that of marketing. Most of the people who don't like it are those who wanted to ship stuff that was not fit to ship or was not packed right. Of the 246 crates of cantaloupes we shipped last year, we were not docked on one. We picked, packed and sold nineteen crates in one day while the wagon was out delivering.

fourteen crates last year, which were shipped at \$1 per crate f. o. b. Los Molinos. Cantaloupes sold for \$280 last year, besides about \$35 worth of seed from \$50 worth of melons that would have wasted during the freight tie-up of three days. Watermelons from one-quarter acre sold for \$35, mostly to the local hop ranch workers. Tomatoes sold for \$25, and sweet corn for \$25 from a tiny patch about one-tenth acre. Kentucky Wonder string beans sold for \$5. Concord grapes from about twenty-five vines on the fence sold readily with demand for three times as many. They are already engaged for the coming year.

plants, which will separate the Kleckley Sweet and Chilian watermelons and sweet corn on the same piece. The watermelon varieties are to be kept separate, for the overripe melons are to be saved for seed, which the local stores handle in preference to Eastern or other seed. Crops from Eastern seed mature too fast in the estimation of the local ranchers, though some varieties have proved all right.

In the back yard are Himalaya berries along the irrigation ditch which separates the almonds from the rest of the place. These run riot and are not much loved because of difficulty in disciplining the vines. Loganberries and Mammoths in several rows are trellised on woven wire two feet wide laid flat on cross pieces fastened to low stakes. This spreads the vines out to maximum air and sun and permits training new growth on the ground underneath until the old wood is cut out after the crop is off. Raspberries border the back garden, which includes also several rows of California grapes, beets, lettuce, peas, turnips and seedling onions. Six bushes of gooseberries were tried against advice of neighbors. These are three years old now. They have a beautiful crop of berries. The last year's crop was used at home and given to neighbors, but this year's crop will be sold. The dewberries are among fruit trees in the front yard, a very pretty sight through blooming, ripening and autumn colored foliage. They had been lost in the deep grass when the Carters moved in. They were planted by someone who was not able to stick it out, perhaps on account of malaria, which has been a general drawback in the colony. This is being removed now by the mosquito abatement district formed under the State law. Hereafter anyone who leaves a pool of stagnant water on his place untreated will be subject to fine.

The front yard contains also plums, pears, apples, peaches, cherries and apricots, under part of which are planted potatoes, onions, peas, etc.

POULTRY AND LIVESTOCK.

Back of this patch are the alfalfa and the barn and chicken yard. Hogs, chickens and cows have been fed over-ripe fruit and unsold vegetables. This avoids waste and keeps the ground free from disease. Three cows proved too hungry for alfalfa, which does not pay so well as vegetables, so only one cow is kept now. As many as 300 chickens have been kept, but these are usually sold off to 30 or 40 and a new lot of baby chicks hatched or bought each year.

Not all has been smooth sailing. Mr. Carter works outside, except during harvest, and carries mail in the winter. Besides misfortunes mentioned above, it was found by costly experience that cut worms must be relieved of their hunger. In the first year several thousand tomato plants were set four feet apart each way. Cut worms took practically all of them. They were replanted and cut worms thrived on the new plants. They were replanted once more and still the cut worms were so hungry that the Carters got only \$15 for their tomato crop. The ground had been in weeds for two years.

The above illustrates picturesquely the combination which has enabled the industrious Carter family to found a home of plenty, health, and happiness in one of California's growing colonies.

That was the day we lost a hay rack load because shipping got ballied up. A good canning association for vegetables and fruits is needed to complete marketing facilities."

Some of the totals from the account book are interesting. In 1915 they sold \$87 worth of dewberries from about 100 hills on one-sixteenth of an acre. Frost got them last year, but, judging by the thick blanket of berries already set in mid-May, Mrs. Carter expects to sell \$150 worth in 1917. Two young plum trees yielded

People said they would not grow here, but they grew thriftily and bore a heavy crop.

THIS YEAR'S CROPS.

About two and a half acres of almonds were planted last winter, and these will be intercropped about three seasons, for there is an abundance of water all through the season from the excellent canal system supplied with mountain water. They had too many cantaloupes last year to handle well, so these will be partly replaced in the almonds with 1,000 tomato

Important Horticultural Laws Signed.

[Written for Pacific Rural Press.]

The five or six state laws affecting horticulture which have just been signed by the Governor are long steps toward protecting and enlarging the fruit interests of California. State Horticultural Commissioner G. H. Hecke, his chief deputy, George P. Weldon, and others who have worked hard for the formulation and passage of these laws, have done great service to the fruit industry. Mr. Hecke has prepared summaries of these laws from which we take the following notes:

SENATE BILL NO. 458.

State Board of Horticultural Examiners empowered to appoint County Horticultural Commissioners upon refusal of County Boards of Supervisors to appoint them.

Squirrels and gophers added to list of pests County Horticultural Commissioners are to eradicate or control. Lien on property to cover cost of eradication or control of pests and diseases by County Horticultural Commissioners shall take precedence over all other liens except lien of taxes.

Shipments of trees, plants, etc., must be held at destination until inspected by County Horticultural Commissioner.

Uniform methods of treatment and disposal of infected nursery stock shipments.

SENATE BILL NO. 460.

Two Field Deputies of the State

Horticultural Commissioner to bring about the greatest possible uniformity in enforcement of horticultural laws.

California nurserymen required to register with State Horticultural Commissioner and receive license whose number must be attached to every shipment. Nurserymen outside the State must secure permits before doing business here.

Salaries of several officials in the State Horticultural and Quarantine Department materially raised in order to retain efficient service.

SENATE BILL NO. 682.

Appropriation for search in foreign countries for parasites of the mealy bug, which is the most serious citrus insect pest. No successful artificial means of control yet discovered.

SENATE BILL NO. 761.

Protects the State against amateur entomologists who might bring dangerous insects. The orange dog caterpillar was recently found in Los Angeles county by an inspector before it got away from its amateur owner.

ASSEMBLY BILLS 145 AND 212.

Standardization of apple and other fruit packing and packages. No. 212 had not been signed, but there was every reason to expect it to become law, making needed changes from similar laws passed two years ago, which are repealed.

EASIER BLACKBERRY MARKET-ING.

[Written for Pacific Rural Press.]

D. W. Moore of Los Angeles County had over two and one-half tons last year on a patch of about 650 hills of blackberries, and about 240 hills of dewberries among apricot trees; but he did not pick them. Shortly before they ripened, he advertised in local papers and on a home billboard that the berries would be for sale at 2½ cents a pound to anyone who would furnish their own receptacles and come pick them. This price was lowered later in the season so it averaged 2 cents. Nobody could kick about faced packages, crushed or molded berries, short measure, etc., because they themselves picked the berries and saw them weighed by the Moores, who did nothing else except attend to irrigation and distribution of pickers.

As people sent or telephoned their orders, the Moores would ticket rows to the amount of the order. If they did not come when they said they would, somebody else got the berries. When too many ripened at once, the Associated Charities sent some of their charges to get berries for nothing. One party from many miles away brought a washtub in an automobile and filled it despite warnings that the berries would mash. One day, after the Fourth of July, there were 25 people picking at once. They hauled the berries away in wagons, buggies, automobiles, carts and wheelbarrows. They had to pick clean, but did not have to pick under-ripe berries unless they wanted them for jelly. No damage was done to the patch and everybody was happy.

The California Associated Raisin Company has appropriated \$150,000 for the 1917-18 advertising campaign. It is proposed to make Sun Maid raisins a household word.

a citrus spray that makes good

After work of several years in groves and laboratories our staff—Entomologist, Chemist, Practical Growers—have evolved for us on citrus trees a spray that will successfully and satisfactorily control insect pests at a cost much smaller than is possible with any other method of control.

TRIUMPH, a concentrated oil spray perfected by our staff, combined with Bordeaux, makes this citrus tree spray. If applied in accordance with our formulas, this combination spray of Triumph and Bordeaux is a beneficial fungicide as well as an effective insecticide.

Triumph with Bordeaux improves the general health of a tree and is safer in regard to spotting of fruit and tree injury than is a straight insecticide.

TRIUMPH with Bordeaux can be applied NOW, this summer, before insects do their damage.

There is no uncertainty about the supply or price. Stocks are on hand in Los Angeles and San Francisco. Shipments will be made at prices we shall be glad to quote upon application.

TRIUMPH with Bordeaux has been proved out by scientific laboratory tests and actual work in groves. It is not a "shot-gun" prescription.

Our new book, "Spraying of Citrus Trees," is full of money-making, new, accurate information. It also contains formulas and tables for the application of TRIUMPH.

Give us your name and size of your grove and we shall be glad to mail you a copy free. Address Box P, Insecticide Department,

ORCHARD SPRAY

Perforated Tree Protector

that will keep Squirrels, Rabbits and Gophers from barking your trees and give perfect protection from hot sun, sandstorms, barking in cultivation, etc. Tell us your pest and we will tell you what kind of a wrap to use. We make a number of kinds and can save every tree for you from pests.

Collapsible Planting Pots

These pots are bottomless. This allows you to plant pot and plant, never disturbing your plant nor stopping its growth in transplanting a single hour.

For starting early vegetables, such as Tomatoes, Cabbage, Eggplant, Cauliflower, Cucumbers, Cantaloupes and Squash; also for propagating Rose Cuttings, Geraniums, Eucalyptus and Conifers. It's the only practical pot on the market today for propagating work. Write us for samples of either Pots or Protectors. Tell us which you are interested in.

THE EXPAN PROTECTOR CO.,
935 E. Central Ave., Redlands, Cal.

"THE BOSS" TREE PROTECTOR

Made of Yucca Palm.

Is cheap, durable and quickly put on the tree. It prevents rabbits from destroying your trees. A sure protection against frosts, sunburn, grasshoppers, or dry winds. Can be easily removed, will last for years. Send for samples.

Growers' Remedies for Cut Worms

[Written for Pacific Rural Press.]

Cut worms have killed thousands of newly planted trees and vines this spring. They climb the trees at night, eat into or through the young shoots and stems of leaves or eat the leafy parts, leaving the mid-ribs. Many trees have been persistently robbed of all buds as fast as they pushed out. Sometimes a tree is cleaned in a night of all its leaves. The worms sleep and grow fat through the daytime around the bases of the plants they feed on, being covered with an inch or two of soil. One grower in Tehama county found 104 around a dock weed pulled in his orchard last week. A Sutter county grower found 117 around a tree.

Cotton Bands.

Will Beresford of Tehama county and his ranch foreman, Mr. Whitaker, tied small strips of cotton batting around the young tree trunks. These were about two inches wide, and it was said that the worms would not crawl over them. About two pounds were enough for the 1100 trees.

Tanglefoot on Papers.

On the Jones & Sproule orchard in Butte county we found G. W. Overton applying tanglefoot on strips of paper around the trees. The strips were about 2x4 inches and were wrapped around the trunk until the end could be pasted down with a daub of tanglefoot placed under it with a small paddle. Then the rest of the paper was daubed by holding the paddle against it and turning the handle around the tree two or three times. It is easy to fix a tree in half a minute. Paper was used for fear tanglefoot would injure the bark. A neighbor reported tanglefoot put on a year ago to be in about as good shape now as then.

Tanglefoot Alone.

On a large orchard near Chico a bunch of men applied tanglefoot directly to the bark of year-old trees in bands about two inches wide and very thick. It was said to require 110 degrees temperature to make it melt. The men had seen worms work themselves out of it, always falling to the ground. Sutter County Horticultural Commissioner H. P. Stabler observed that cut worms walked right through tanglefoot freshly spread on a paper flat on his desk. But a day or two later the tanglefoot had become much

more sticky. Anyhow, they might crawl on a flat surface but not up a vertical surface through tanglefoot.

Chickens Scratch Them.

Mr. Overton noted that for 300 yards from a chicken house where chickens had free range they would scratch around the trees and clean up the worms, protecting the trees from the excessive injury observed in other parts of the orchard. The same point was made at a neighboring orchard across the road from a flock of hens.

Arsenate of Lead.

J. T. Onstott of Sutter county had tree protectors up to the limbs of his newly planted trees. These being set a couple of inches into the ground, had no cut worms inside them and could have been banded with tanglefoot like the tree trunks noted above. But his workmen had become too stuck up trying to handle it in the form of fly tanglefoot paper. So the tops were sprayed from a compressed-air sprayer carried on his back, with a pound of powdered arsenate of lead per 50 to 100 gallons of water. We dug a score or more of dead worms from the soil under several of the sprayed trees. Powdered arsenate was dusted on young grape vines, but a rain that night washed off most of it.

Poisoned Bran Bait.

Many Fresno and Santa Clara county fruit growers have recommended poisoned bran, as published in our columns frequently. This is to be scattered on the arms and around the trunks of vines and trees.

WIRES INSTEAD OF PROPS.

Props under fruit trees are always in the way of cultivation. When wind lifts the branches, props fall. It is more work to install props and far greater expense than to use wires as Will Beresford does on his heavily loaded prune orchard in Tehama county. When weight of fruit begins to bend the branches down, many sticks are cut about an inch and a half in diameter and a foot long. Number 12 wire is fastened around the center of a stick and placed in a crotch needing support. The wire is stretched across the tree to a similar stick back of another crotch. It is pulled tight and fastened. No. 11 wire is too stiff, while No. 13 is not strong enough.

Now Is the Time to Fight Grasshoppers

[Written for Pacific Rural Press.]

Grasshoppers were hatching in myriads on the warm hillsides in the middle of May, according to Butte County Horticultural Commissioner Earle Mills. They feed there until green feed is gone. Then they migrate to farmers' crops. The time to control them is before they migrate. In the June issue of the Monthly Bulletin of the State Horticultural Commission is an article in which T. D. Urbahn of the U. S. Dept. of Agriculture recommends the following poison: Mix a pound of Paris green thoroughly with four gallons of water and two quarts of cheap blackstrap molasses. Add half a dozen lemons ground fine in a meat grinder. Slowly pour this mixture over 25 pounds of bran and stir thoroughly to a uniform mixture. White arsenic is about as good as Paris green. Oranges or a little salt may replace the lemons. Alfalfa meal or rice meal may replace the bran. Broadcast this on hill land by hand or with an end-gate grain-seeder. Spread finely, for all lumps are wasted and a menace to stock. The above amount is enough for five acres.

Grasshoppers feed ravenously late in the afternoon. The poison is most effective if spread early in the afternoon. In alfalfa, mow alternate checks to concentrate the grasshoppers, then poison them.

Always be careful not to poison livestock and poultry. Two or three days after the poison is spread, the grasshoppers will collect in shady places and die. Ants, beetles, etc., will eat many of them.

5 years
or
25?

Farm tools and machinery left out in the open have an average life of 5 years. With proper protection they will last 25.

If *your* implements are rusting out of doors, start an implement shed at once. Use California Redwood for posts, mudsills, frame, siding and shingle (or shake) roof.

California Redwood

Resists rot and fire

Redwood contains a *natural* preservative which gives it wonderful living power in contact with the ground, or when exposed to the elements. Redwood does not have to depend on *artificial* preservatives for its durability.

And Redwood is *fire resistant*. It gives you real protection. Redwood is light in weight, easily worked, and the seasoned lumber does not warp, swell or shrink.

Its use for *any* farm purpose is a real economy.

Humus Helps Citrus Fertilizers

[Written for Pacific Rural Press.]

"The great proposition here is to get humus," says C. D. Baker, speaking of his orange orchards in eastern Los Angeles county. "Commercial fertilizer is wasted unless you have humus to encourage bacteria. With plenty of humus in the ground, it takes water like a lamp wick. Otherwise you are likely to think you have given enough, but the outside leaves will get pinched and the crop will suffer."

In the fall of 1915, Mr. Baker put a little over a ton per acre of loose spoiled alfalfa on the three orchards comprising 23½ acres and disked it several times after pulling it apart. It cost \$8 per ton at the orchard and was preferred except for the great labor of working it in. Last fall and whenever he could get it, up to February this spring, manure and lima bean straw were applied. A bale of bean straw in every square between four trees or 10 to 12 cubic feet of manure per tree, added nitrogen and

humus with less labor. The bean straw cost about \$10 at the orchard, but of course all such materials cost more now. Cheaper humus and nitrogen would have been obtained last winter on ten acres if the melilotus cover crop had been planted earlier and irrigated sooner after planting.

Having supplied humus, Mr. Baker puts commercial fertilizer freely to the trees. Blood and superphosphate, six pounds of each per tree, were applied late in February, 1916, just after the heavy rains, but in time to benefit from light late rains. Eight or ten pounds of blood per tree should be applied each year, thinks he.

These trees were hard hit by the freeze of 1913, and even last spring not all of the dead brush had been pruned out of them; but they had been improving greatly in fruit wood, color of leaves, etc., in the past two years, especially since the heavy pruning in 1915.

The growers of oranges at Riverside and Redlands have been compelled to bring in help from outside

districts to pick their fruit. Some Mexicans have found work in California orange groves.

THINNING PLUMS NOW.

[Written for Pacific Rural Press.]

It is necessary for H. A. Bassford to thin all his shipping plums this year except the Grand Dukes, which were frosted. "The quicker they are thinned now, the better," said he, in commenting on the thirty-five men he had at that job. The smaller varieties, such as Beauty, Diamond, etc., should be left about an inch apart, while Gaviota, Formosa, Grand Duke, Santa Rosa, Wickson and Vacaville may be left two to two and a half inches apart. Imperfect plums should be picked first, and in all cases care must be exercised to avoid loosening the stems of those remaining. Such loosening is not noticed until a day or two later, when the plums shrivel and turn yellow. In Vaca Valley frost danger is usually past by April 20, after which thinning may proceed. "We must thin our shipping fruit to get fancy sizes."

HOW I SAVED MY APRICOT CROP.

(Continued from first page.)

this time had leaky bottoms. I could not raise the temperature to the customary 31 degrees, and as a consequence lost 25 per cent of the crop.

With all my blunders I will have at least eighteen tons of green fruit, which I consider about 65 per cent of a crop. The seven smudgings cost less than \$100. It seems to me that I have been well paid for my work. And, too, there is a lot of fun in the fighting—the doing something that the other fellow won't do; and that is worth something. It's a game of war: You have pots for men, oil for ammunition—and the enemy, King Frost, has only a flimsy airship.

It is expected that the California orange crop this year will exceed 54,000 carloads. The Florida estimate is 20,000 carloads.

Fire pots in apricot orchards have proven to be ineffectual this year because of severe and continued cold nights.

Don't worry when you stumble. Remember a worm is the only thing that cannot fall down.

Heap big mileage!

Mileage Makers

Every Savage mileage maker gets full credit for good work because all work is "keyed" to the serial numbers on the tires. We know in every case just who is responsible for "Heap big mileage."

This plan creates a strong sense of personal responsibility and pride among our workmen, and there is keenest rivalry to see who can produce most mileage per tire.

You can help us to produce even greater mileage for you if you will send us full details of all Savages that run over 7000 miles

Please be sure to give Serial Number size of tire, date of purchase, name of dealer and actual number of miles run

To help show our appreciation for this co-operation, we will send an inner tube patch free of charge to all who report, "Heap Big Mileage."

Watch for the red Savage sign

Building an Empire on a Sea-Bottom Desert

[Written for Pacific Rural Press.]

SELDOM have 15 years of one man's life been so intimately interwoven with everything concerned in the rise of an agricultural empire as have those of W. E. Wilsie; and more seldom still is the debt of gratitude so universally and unstintedly accorded as by the people of Imperial Valley to this man, who has ever put public interest ahead of his own, and yet made good also in a personal way. He himself, however, is more thankfully proud of, "My real success has been along lines other than money."

He has seen the Valley increase from perhaps a thousand settlers to a population of 50,000 or 60,000. He has seen the irrigation of 300,000 acres that had been a veritable death valley; and he will probably live to see 300,000 acres more brought under ditch water. He has seen lonely men struggle with the elements, dot the landscape with trees and homes, and bring happy families to be neighborly. He has seen the effect of alfalfa on climate; for where growing things absorb heat, it is not unbearably reflected from parched ground.

We found Mr. Wilsie sitting in an easy chair on the veranda, awaiting the noon meal with a family educated in the schools he fostered. "My wife liked it here from the first," said he, "and she has not slept off the ranch fifteen nights in the fifteen years." She was made of stern material, we ken, to like that forsaken waste after the six-day ride 27½ miles from "Old Beach" (now Niland) to Imperial. A 12-horse high-wheeled lumber wagon brought her and the children with their household furniture, through ruts too deep for a buggy, through the incomparable Imperial Valley mud made by a rain of one and three-quarters inches the night after they arrived at "Old Beach." That was in the spring of 1902, after the water had come through the ditches for the first time in June.

Yes, there were "trees" which died annually and grew so big each year that a man would get lost in them. Mr. Wilsie has measured one 14 inches in diameter and 14 feet high—common pig weeds. Where weeds grew so luxuriantly, it was reasonable to believe that feed would grow. He settled near what is now Imperial, and raised a crop of barley and sorghum corn that first summer; then moved to the ranch near El Centro, April 3, 1903.

With the first combined harvester shipped into the Valley, Mr. Wilsie cut the first grain shipped out—three cars of barley and one of wheat in June, 1903. The first train had come to Imperial in May, 1903. He has been raising barley ever since, and now has 280 acres of it on one of his ranches; though of late years Durango cotton has been his principal crop.

The banks in 1902 put up money and shipped in steers which were sold to farmers on time. These farmers fenced their corn and pastured the steers on it, finishing them on barley. When the stock was sold to the butcher, the banks

were paid, with interest at 10 per cent—a good transaction for the banks, for the farmers, and for the country.

In the spring of 1903 a San Diego man started a creamery in Imperial. Feed on the Coast was short that season; and dairymen drove their cows to the Wilsie fields and those surrounding him. Mr. Wilsie bought about 80 of these cows. He hauled his milk around El Centro one day, about 1905, and sold 17 cents' worth, finding only two ladies in town. That milk trade worked up to \$450 and \$500 a month; and he milked as many as 200 cows at a time, the surplus going to the creamery. His two boys having grown up and left home for school, he sold his dairy out.

line of farming in the valley—horticulture. Under this head are included weeds, cantaloupes, cotton, and vegetables, besides fruits. It was for Mr. Wilsie to do all the broad fundamental work of developing these things (except weeds) and to write every horticultural ordinance that the county has today. It was for him to encourage the experiments in growing all kinds of fruit and produce in order to test out this soil and climate, the likes of which do not exist elsewhere in America or the world. Many fruits have failed, but wherever cantaloupes are eaten in America, there Imperial Valley is named. Imperial Valley cotton is the wonder of the cotton-growing world for cleanness, productiveness, and staple. Where-

with 30 or 40 other varieties, in experiments that lasted several years. Durango seed had been saved from the St. Louis World's Fair exhibit of cotton from Durango State (Mexico); and 10 acres had been grown in Texas under U. S. Dept. of Agriculture supervision. Some of this seed (two rows 200 or 300 feet long) was planted in 1910 in a separate plot, and two rows 40 rods long were planted in the short-staple field. Next year with seed from the patch grown separately, Mr. Wilsie grew three acres of Durango. It produced four and one-half bales which sold in New Orleans for 19 cents—way beyond ordinary cotton prices then. The seed was saved carefully and a meeting of growers was called at which the seed was distributed. Owing to interpollination due to farmers planting Durango close to other varieties, this soon became mixed. Mr. Wilsie claims to have consistently protected the pure Durango seed, and his is still the place government men come for pure seed. He has cotton now on the ranch traceable by records in Washington, D. C., back to the original Durango. He grows nothing but Durango and he persistently "rogues" out all off-type plants from the seed field. Until a year ago, he was president of the Cotton Growers' Exchange, organized in 1912 and reorganized in 1914 into the Imperial Valley Long Staple Cotton Growers' Association. He has seen the Durango crop grow from three acres in 1911 to 35,000 acres in 1916. "You get me going when you say 'cotton,'" were Mr. Wilsie's parting words.

CONSERVING MOISTURE WITH ROLLERS.

Heavy winds and lack of rainfall is making it necessary for many summer crop farmers on unirrigated land in the San Joaquin Valley to take extraordinary steps to conserve what little moisture there is in the soil. There are various ways of doing this, but the writer has found a spiked-toothed iron roller very effective on a sediment soil. Plowing was delayed longer than it should have been, with the result that a rank growth of burr clover and other weeds about sapped all of the top moisture. Because of the lateness, we secured a tractor outfit with good heavy plows to plow about ten inches deep and we followed this immediately with two cross harrowings, the first one being done by the tractor to save moisture, as they could pull 75 feet of harrow.

This was followed with a Cunningham land pulverizer, which not only broke the clods in fine shape but left a nice mulch as well. Now, after one week, the moisture is gradually raising and a good portion of the field will not have to be irrigated as a result. A neighbor who could not sprout "gyp" corn seed because of lack of moisture has borrowed the roller to go over his field before replanting on the theory that it will firm the top soil down to the moist soil underneath and thus start capillary action and raise the moisture.—J. C. L.

A Durango Cotton Plant. This is the long stapled, high-priced upland variety which has increased by the thousands of acres every year in Imperial Valley. Its introduction and the continued purity of its seed are largely due to Mr. Wilsie's efforts.

FIRST CO-OPERATIVE CREAMERY.

While Mr. Wilsie was yet in the dairy business, he had a great surplus of milk. He was instrumental in forming the first co-operative creamery in the Valley and was its first president. He dug the settling pool for the first ice plant in Imperial and hauled the rocks for the engine foundation. He was president of the El Centro Cantaloupe Growers' Association, which did business as long as cantaloupes were shipped from that station. It was the first cantaloupe growers' association in the Valley.

FIRST HORTICULTURAL COMMISSIONER.

You might not expect a dairyman to make a successful horticultural commissioner; but when the county was organized in 1907, its supervisors asked Mr. Wilsie to undertake the promotion and protection of what has become the best-known

ever Eastern folks eat early California vegetables and fruits, there Imperial Valley is known.

Assisted by natural barriers and salutary local ordinances, most horticultural pests have been kept out of the Valley. Two or three years ago Mr. Wilsie's deputy, F. W. Waite, took up the work.

HIS WORK FOR COTTON.

Mr. Wilsie was not the first to grow cotton in Imperial Valley—he never saw cotton grow until he saw it tried there in numerous test plantings by the U. S. Dept. of Agriculture. But he grew 70 acres of the first commercial crop (of 450 acres) grown in the Valley. It was in his capacity as farmer-horticultural commissioner that he imported and sold to farmers at cost a carload of pure short-staple seed. About that time it was decided to try out what seemed a better variety (the long-stapled upland Durango) along

WHAT IS THE MATTER WITH THE FARMER?

To the Editor: I asked my grocery man the other day the price of dried peaches. He said that he hadn't handled a dried peach in a year, that they were not even quoted any more.

Napa county, until a couple of years ago, had lots of peaches, but prices got so low that they were either worked over to prunes or else dug out. Now the very men that were responsible for the low prices are offering big prices in order to get the grower to plant peaches again.

The story of the peach is the self-same story of the orange, lemon, fig, grape, prune, etc. Cannot the grower be made to wake up? The childish greed of the middleman works against himself, the grower, and the public. He doesn't have sense enough to let the grower live at all; he just crushes the life out of him.

Cannot the farmer be got to join one big organization, whose aim is to uplift all farmers and not a certain group? I have belonged to several farmers' movements, but when I got acquainted I had no difficulty in seeing the middleman earmarks all through them.

Why do we need a separate organization for the citrus man, or the raisin grower, or the prune and 'cot grower? Many ranchers are interested in half a dozen crops, and the same with stock. If we had all the different organizations under one head, we could afford to get a big man to head it and pay him a big salary.

We have in Napa county a Farm Bureau, two granges, a Farmers' Fire Insurance Co., and, until a couple of years ago, a Farmers' Union. When the Rutherford Grange started they started a fire insurance company, so we have two. When the Farm Bureau first started we did quite a little co-operative buying. Our Farm Adviser got lime for us for half the price we formerly paid. Today we have gone back to the old game, buying locally and separately at \$12 per ton, and in consequence no more lime is used. Farmers bought hay and grain and many other things co-operatively, but no more.

We have a most wonderful Board of Supervisors in Napa county. Grand Jury reports go to show that in the past six years \$600,000 have been squandered on our county roads. Our Chamber of Commerce has taken up the question with a competent road engineer and found out we could have cement roads for less money than we are now paying. We tried to get a new charter. The local Grange voted in favor of it, the Rutherford Grange voted against it.

When the Rural Credits question was before the people, the Rutherford voters went against it. Suscol has a farm center; she put in 32 votes against and 1 in favor of Rural Credits. Coombsville, an adjoining center, voted in favor of it. I particularize to show that the farmer is not thinking at all.

Napa. CHAS. BLOM.

It is a rule that holds in economy as well as in hydraulics that you must have a source higher than you tap.—Emerson.

More Crops

In these days of war and strife, the things we hear most about are more crops, and more abundant crops. Some eminent personage has said, "Whether for peace needs or for war necessities, the use of fertilizer is the basis of crop production." The truth of this saying no one knows better than the man who uses Hauser's Organic Fertilizers. He gets more crops, more abundant crops and better crops.

Don't delay, communicate with Hauser Packing Company about your fertilizer needs, use fertilizer and get results.

Vegetable and Field Crops.

[Written for Pacific Rural Press.]

Corn and Tomatoes.

Corn and tomatoes are planted half way up on the sides of furrows in Manuel Vetter's garden in Tehama county. When water runs through the furrows it soaks the roots without touching the plants. Part of the ridge can be raked into the furrow so soon as the water has sunk away. This will kill weeds and prevent evaporation and baking, but keep the roots moist.

Soil Auger Before Buying.

Before buying a piece of river bottom land a Sacramento Valley settler took a sample to a good authority and asked if it was good for alfalfa. The reply was that the only question in this case was depth of soil and a supply of moisture. The settler tested several places with an eight-foot soil auger, finding loamy soil as deep as the auger would go. He bought the land and enough water to supply the alfalfa for two years, after which he figured its roots would be deep enough to get moisture the year around.

Squash on Ditch Banks.

In order to utilize every foot of his land this year, J. W. Scott of Stanislaus county has kept his ditch banks cultivated all spring that he could grow squash on them for hog feed next fall. In ordinary years a big lot of land is wasted in ditch banks, but by keeping them cultivated there is room for two rows of squash on Mr. Scott's ditches, and as the land in them sub-irrigates all during the summer they will require very little care after planting. He uses a "crooked neck" variety of squash because of less damage from worms.

Guarding Against Weevily Bean Seed.

Bean growers who have not already planted will do well to thoroughly fumigate their seed with carbon bisulphide gas before planting, as weevily seed not only does not germinate well, but plants from such seed do not grow satisfactorily after coming up. To eliminate weevils from seed before planting, place the seed in a tight receptacle (wine barrels will do nicely) and pour carbon bisulphide into an open dish on top of the seed. An ounce for each 75 to 100 pounds is recommended. As the fumes from the liquid settle among the beans, all of the weevils are killed. The gas should be allowed to act from 24 to 36 hours, and as it is highly explosive it should not be exposed to artificial light or fire. A simple way of determining whether seed is infested with weevil is explained by a bean broker, who sets a tray of each sample lot of beans on the radiator in his office. The heat drives the weevils out, he says, if there are any to be found.

Bean Soil Packs.

According to Ray Ingram of the Gabert & Ingram ranch, near Gavilota, they have trouble in preventing the soil from packing. They plow their bean land immediately after harvesting in the fall with a Samson tractor. In the spring they use a Killefer bean chisel, pulled by a

Samson, with a harrow hitched on behind. They then hook on a bean planter of multiple style and behind that pull a drag. This does the plowing, the cultivating and planting, and drags the land to keep the moisture in, all in one operation, and so does not begin to pack the soil as much as if two or three separate operations were made. Gabert & Ingram always have about twenty sacks to the acre of small whites.

It is said that hundreds of acres in the Redlands district will be planted to beans and potatoes this spring and summer and two gardens will grow where none grew before.

A report from Hamilton City states that the sugar beet factory at that place will be ready to operate by July 1.

"The Car of No Regrets"

KING EIGHT 60 HORSE POWER

You "make hay" when you buy a King

IT is an automobile sufficiently reliable under severe official road tests to have its chassis adopted by the United States Government for armored cars, though it shares this honor with several other good makes of cars, some of higher price.

Its four bodies were designed for unusual grace of line and elegance of finish, and one of them may appeal to you as being more beautiful than any other car among the many attractive models now on the market.

The King is built by a long-established company with a reputation for good cars and fair dealing, ranking high among a number of worthy competitors.

It is a car which may be conservatively described as economical, considering its high power and bigness, and one that "handles" easily,—its all-round road competence, especially on hills, has surprised and delighted many.

In all, we believe the King Eight does offer a quite remarkable combination of power, economy, reliability, comfort and style, which, considered with the price, makes it a purchase absolutely safe for anybody and one thoroughly consistent with our slogan "The Car of No Regrets."

Foursome (shown above), \$1700; 7-passenger Touring model, \$1650; Sedan, \$2300; Roadster, \$1585. Prices F. O. B. Detroit and subject to increase at any time. A catalog in color will be sent on request together with the name of a near-by King dealer.

KING MOTOR CAR COMPANY, DETROIT, MICHIGAN

CRITICS' AND CUDDLERS' CORNER

Subscribers are welcome to praise or to condemn (in letters of not over 200 words) anything which appears in the reading columns of this journal. Contributors to this department may drive and counter-attack each other as they see fit without endorsement or response on our part.—Editors.

Likes the Kaiser, but Loves Humanity!

To the Editor: I consider it an unfriendly act to print, under the sarcastic heading, "Cream for the Kaiser," a part of my letter which was written when we were still at peace with Germany. You refrain from printing my name, but I suppose some secret agents will be up here and shadow such a dangerous enemy spy! If they do, they will find a duffer that is not only harmless but broad-minded and liberal enough to give the devil his due, even the "demon Kaiser." They will also find, if they care to investigate, that this same duffer in 1915 personally solicited a subscription to the Belgium fund in this town, heading the list with \$20, and collected \$480 and odd in denominations of mostly fifty cents and a dollar; and that he holds a letter of thanks from the Belgian Consul at San Francisco. And if they care to investigate further they will find that he has since then subscribed more to the Belgian fund and to the Polish fund and sent Christmas boxes to the German soldiers in the trenches, and that he has just collected a subscription of \$52.75 for the "Overseas Tobacco Fund" for the British soldiers in the trenches.

Have you, Mr. Editor, done as much personally to furnish real cream to the enemies of the much-despised and greatly admired Kaiser? I hope so. READER.

Angels Camp.

Farmers Embarrassed by Attention.

To the Editor: I see in your journal of May 12 an article by Gifford Pinchot saying the safety of the country is in the hands of the farmers, etc. I have noticed considerable of this writing in the papers of late urging farmers to speed up to save the nation and mankind from starvation. Most of the writers are not farmers. The real farmers are saying very little. They are overwhelmed by the solicitous attentions now gratuitously bestowed upon them. We real farmers who come into direct contact every day with mother earth, and are not schooled in the fine art of politeness, scarcely know how to respond to such marked attentions.

No one complained when we sold our dried peach crop in 1914 at 2½ cents a pound—below cost of production. The equilibrium of society was not disturbed in 1915 when the peaches rotted on the ground because no one would pay enough for them to meet the cost of drying. Such memories do not induce us to burst with enthusiasm now. Many writers preach "back to the farm," but not themselves! The cities are overcrowded now because the farm has been discriminated against and made hazardous by speculators in farm products. Environment controls our lives—not argument.

Doubtless this scarcity of food will serve at least one good purpose—it will prove that farming is the greatest factor in modern business life, and that to discourage the farmer by handing him the short end of everything is a dangerous practice.

Greenfield. J. D. DUNOVANT.

1917 FAIR NOTES.

Not all fair dates are set. Those omitted have not responded to our request for their dates.

Placer County Fair, Auburn, in September.

California State Fair, Sacramento, Sept. 8 to 16.

Stanislaus County Fair, Modesto, during week of Sept. 17 to 22.

Kings County Fair, Hanford, Sept. 17 to 22; B. Gravatt, secretary.

Napa County Fair, Napa, Sept. 22 to 26, under auspices Napa Agricultural Society; N. F. Coombs, secretary.

Fresno District Fair, Fresno, Sept. 24 to 29, will offer special premiums for most efficient and prolific growing of food products. Livestock premiums increased and new facilities will be added to fair grounds.

Yolo County Fair, Oct. 4 to 6.

Riverside County Fair, Riverside, Oct. 9 to 13.

Proposed Solution of Farm Labor Problem

[Written for Pacific Rural Press by David N. Morgan, Associate Professor of Agriculture, University of California.]

Agriculture as practised in California has not been economically sound. No other business could operate on such an irregular margin of profit. A farmer has certain fixed charges which vary but little from year to year. The yield per acre varies considerably, due to quantity and distribution of rainfall and seasonal variations. A short crop in a section of the State does not necessarily mean a high price to the farmer; nor does a heavy crop always mean a low price. National and international crop yields must be considered.

WHAT CHEAP LABOR HAS CAUSED.

There is introduced into farming operations a hazard which has caused farmers to work with a minimum outlay for labor, equipment and housing conditions in order that a possible poor yield might not bankrupt them.

The housing facilities for farm laborers on many California ranches have been so poor that the only class of laborers who will endure such treatment is the submerged races from southern Asia and the Orient, who have a lower standard of living than the Americans. They have, up to the present, been contented with a lower wage than an American demands.

The existence of this large class of uneducated, under-fed, under-housed and under-paid labor has made possible the operation of our California farms on an unstable basis. It has been possible for farmers to sell their crops for less than the actual cost of production. In lean years they have gone without pay for their own labor, and by underpaying their help they have escaped the clutches of their mortgagees.

In years of high yields and high prices the farmers, by practising the same methods of economy, have made apparently large profits. These profits when spread over the lean years indicate a narrow margin of profit or loss annually.

These conditions affect the small farmer as well as the larger companies, since their markets are the same. The small American farmer is in a worse predicament, however, for his labor is in competition with the underpaid labor on the larger farms.

PREDICAMENT OF THE SMALL FARMER.

A farmer is dependent for his income on the interest on his capital invested plus his own labor. The smaller his capital the larger per cent of his income must be obtained from his labor. The labor of the inadequately financed farmer, when brought in competition with the races that have a degraded standard of living, does not always yield him a satisfactory living.

Large corporations, such as sugar beet companies, when sugar prices are high go into districts and offer a rental for land 50 per cent higher than the American small farmer can afford to pay. The companies can do this because they expect to operate this land not alone with adequate machinery and capital, but more important, with underpaid, poorly housed contract Oriental la-

bor. The actual rental paid for this land under such conditions places an inflated price on the land, thus increasing the difficulties of the small American farmers who are striving for a foothold.

A HIGHER CLASS OF LABOR DESIRABLE.

The condition on the part of the California farmers to so operate is not of their own choosing. They would much prefer to have in their employ a class of laborers comparable with those employed in the building trades and large industrial concerns or public service corporations, for nothing is more exasperating nor discouraging to a good farmer than inefficient, irresponsible laborers. The uncertain margin of profit in farming has previously not permitted the farmer to compete with industrial plants for unskilled labor.

The industries of the cities are withdrawing from the country more of the dependable labor. These men are not attracted by the lure of the city nor the moving picture entertainments, but by the higher wages and better living conditions. A country-bred man gets his greatest pleasure in the country and looks forward to the day when he can go back. The army draft will interfere further with the normal supply of farm labor. The farmer in California must this year compete with industrial concerns for his supply of unskilled labor. This is an actual fact and not a theory. To do so successfully he must provide housing conditions as comfortable as are ordinarily obtained in cities by the same men and pay a wage equivalent to that paid in the cities.

RESIDENT FARM LABORERS.

When the farmers realize the necessity for this action hundreds of hard-working men of family in the cities will gladly move into a house in the country where they may have their garden and cow and chickens, and be ready to give an honest day's work to any of the farmers in the district whenever they may need them. The cost of supporting a family in the cities where the children have little opportunity to help will tend to divert many families to the country. Farmers may have the opportunity of providing themselves with a dependable and permanent labor supply.

If men were operating a shoe factory they would pay the increased wage demanded and add the price to the shoes. If a railroad, they would ask and receive an increase in rates. If engaged in any line save the production of foodstuffs, they would pay their laborers a wage comparable with what they could receive elsewhere, and attach the added cost of this labor to the selling price of the product.

But since the farmer does not know the price his product will bring when placed on the market, he hesitates to increase the cost of production through paying higher wages for labor. With an apparent labor shortage imminent, and no basis for figuring the selling price of his crop, he hesitates to plant summer crops. There are too few agencies that care to contract for the

Corn Cane Maize Cow Peas Soy Beans Field Beans Sudan Grass

KARL A. HEDBERG

ELECTRICAL ENGINEERS
104 Clay St., San Francisco, Cal.

farmers' crops in advance. The farmers must take all the risk, do all the hard work, and accept the price offered at harvest time.

THE GROWER NEEDS AN ASSURED PRICE.

An effort was recently made to have the Army, through its Quartermaster, contract for as much of this year's crop of beans as it will require. It was hoped that such a large consumer of beans would be in a position to know the profitable bean crop of this year and the Army's contract price would serve as an index of the price to be expected.

Canneries and other purchasers of perishables long ago learned the necessity for contracting for tomatoes, etc., before they were planted. If they failed to make such contracts, there would be danger of inability to operate the canneries on a paying basis. Long before the tomato crop is in blossom the canneries have sold their pack to the jobbers and the jobbers in turn to the retailers. The contract price for tomatoes is fixed through the knowledge of the grower and the canner of the cost of producing the preceding crop under existing labor conditions.

Men and firms of large capital who term themselves grain buyers and bean buyers should be willing to do the same thing. They do not do so now for the reason that the world supply and demand affect the prices, and they are unwilling to share the risk which the farmer is asked to shoulder alone.

CONTRACTS SHOULD BE INSURED BY A BOND.

In the past, where contracts have been made, the farmer has had lit-

tle protection, for a bond insuring the fulfillment of the contract has not been forthcoming. The concern that contracts for farm products should give a bond just as a contractor does who agrees to put up a building for a certain fixed sum. If farmers had a contract price for their crops before they were grown, there would be less difference in price at different seasons.

This government recently loaned money to the allies with the stipulation that it be spent in this country. The ink was hardly dry on Secretary McAdoo's check before the allies commenced buying wheat. Our millers did not wish to find themselves short of wheat, so bid against the allies' buyers. Just as in a live-stock auction ring, the price jumped, yet the intrinsic value of the wheat did not increase. It would go no further in feeding people than before. The money voted the allies did not purchase as much food as it was intended, and the profits which accrued went to a few. How much better would it be for the country as a whole if the farmers were assured a price sufficient to enable them to properly house, feed and pay their labor. And for the consumer, if such gambling with the "staff of life" were made impossible by being unprofitable.

BOTH MAXIMUM AND MINIMUM PRICES.

If contract prices for foodstuffs are not made before crops are harvested, farmers will hesitate to compete with other industries for their labor. If they do not pay wages which will compete, they will suffer from a shortage of labor.

Those men who have bought staples directly from the farmers in the past must come to his rescue at this critical time and contract for his crop on a basis which he can afford to compete with other industries for his labor.

An opportunity presents itself to place agriculture on a stable, economic and financial basis through the fixing of prices before the crops are grown. Gradually our farm labor problem will be automatically solved. Our rural population will take on a new and healthy appearance. Land values will become stabilized. Farm lands, the best part of California, will be preserved for Americans, and the wild cry for more unassimilative peon labor by well-intentioned but thoughtless people will be silenced.

The young and tender seed pods of some varieties of radishes are sometimes used for pickling like capers; in fact, the Madras or rattail radish is grown exclusively for its pods, which are eaten cooked and also used in pickle making.—United States Department of Agriculture.

The green tops of young onions and leeks cooked as greens are excellent.

Life is too short to pull or burn stumps

With \$5 worth of either of the Giant Farm Powders one man can remove more stumps in five hours than he could pull or burn out in as many days. And a boy with a team can clean up the pieces in another five hours. There's no way in which land can be cleared so easily, quickly and cheaply as by using one of the

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

Eureka Stumping Powder is for dry work and Giant Stumping Powder is for blasting stumps in wet soils. These Giant Powders get out the small stumps at the lowest cost and save many dollars in blasting large stumps.

"I used eleven tons of your powders at Samuels, Idaho," writes H. F. Samuels. "The stumps removed were from eighteen inches to five feet in diameter. We had the very best satisfaction."

The Giant Farm Powders are made especially for blasting western stumps and for other farm work. Be sure you get the genuine.

160 ACRE FARMS IN WESTERN CANADA FREE

Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta 160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from \$15 to \$20 Per Acre.

The great demand for Canadian Wheat will keep up the price. Where a farmer can get over \$2 for wheat and raise 20 to 45 bushels to the acre he is bound to make money—that's what you can expect in Western Canada. Wonderful yields also of Oats, Barley and Flax. Mixed Farming in Western Canada is fully as profitable an industry as grain raising. The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. There is now an unusual demand for farm laborers to replace the many young men who have volunteered for service in the war. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to GILBERT ROCHE, Canadian Government Exhibit, San Diego, Cal. Canadian Gov't Agt.

Field Crops.

Alfalfa loose is selling for \$15 a ton in the vicinity of Pomona.

Nearly 700 acres of tomatoes will be planted this year by farmers of Tulare county.

George W. Lane of Morganhill says he has no Sudan grass seed whatever for sale.

Blackeye and tepary beans are coming along good in the Pomona district.

Estimates indicate that the joint crops of cantaloupes in the Imperial Valley and Turlock sections will total 152,235,000 melons, or 9,950 cars.

The average condition of winter wheat on May 1 was 73.2, compared with 63.4 on April 1, 32.4 on May 1, 1916, and 86.6, the average for the past ten years on May 1.

The Stockton Chamber of Commerce voted 94 to 69 in favor of importing Oriental coolie labor to the United States, in an effort to solve the farm labor problem.

Best grain prospects in years are reported by C. A. Duncan of the Tudor district, Sutter county. One wheat crop looks like 10 sacks per acre; another like 12 to 15 sacks.

Cold nights and hard winds last week damaged growing crops in the lower San Joaquin, such as beans, sugar beets and cantaloupes. Some reports place the damage at fully 25 per cent.

I. S. Hurst, a potash man of Los Angeles, says the desert cacti contains 15 per cent of chemically pure potash—a higher percentage than is yielded by kelp, which undergoes a more expensive harvesting and drying process.

An application has been filed with the State Railroad Commission on behalf of all the railroads in the State for a general increase of 15 per cent in all intra-state freight rates without exception, including both class and commodity.

State Horticultural Commissioner George H. Hecke has issued a call to each of the 47 county horticultural commissioners of California to attend a conference at Modesto, June 6 and 7, to discuss California's \$150,000,000 fruit crop.

Deciduous Fruits and Nuts.

Twenty-five crates of little apricots were shipped East May 18 by the California Fruit Distributors.

In Hemet peaches are being contracted at \$50 a ton and apricots at \$45 to \$50.

Peaches and apricots in the Pomona district will average 90 per cent of a crop.

Tragedy plums are a heavy crop in the East Biggs section of Butte county.

The apricot crop around Calexico is good. Shipments have commenced and it is said 12,000 crates will be shipped during the season.

During the past two years the prune production and trade of Bosnia has suffered seriously on account of the war.

Reliable reports from several important districts of eastern Sicily are to the effect that present indications point to an almond crop only one-third as large as that of 1916.

The San Leandro cherry crop this season will not exceed 25 per cent of a full crop. Lack of pollenization is suspected to be the cause, but it has not been so demonstrated.

Seven cents a pound is offered at Graton, Sonoma county, for Royal Anne cherries. Those grown in that section have a good name for size and quality.

It is reported that a 90 per cent prune crop is expected in Santa Clara county. A 60 per cent apricot crop and a 45 per cent cherry crop is also expected. The pear crop will be very large this year.

W. A. Bumwardner of Pomona has signed up with the Pomona valley cannery for "cots" at \$50 a ton and Tustin cling peaches at \$45. Free-stones are selling for considerably lower.

The prune growers of Sonoma county are opposed to allowing the price of prunes to go above a 7-cent basis. It is said they desire to build up a strong demand which will keep the price as nearly stationary as possible at a reasonable profit.

Merced's olive, peach, pear and plum orchards this year give promise of a 100 per cent crop, while apricots give evidence of measuring but 60 per cent of the normal yield, and almonds 75 per cent.

An increase in wages of 2½ cents an hour has been announced by the California Associated Raisin Company in all of its plants and by the California Peach Growers, Inc., in its Fresno plant. Men receiving 22½ cents an hour will get 25 cents, while those getting 25 cents have been raised to 27½ cents.

J. J. Fox, for several years Horticultural Commissioner of Napa county, resigned his position this week to accept work with the Government Land Bank at Berkeley. Mr. Fox was one of the set of hard-working commissioners and made good, and Napa county farmers were sorry to see him leave.

R. W. Skinner of Yuba City on May 18 took to Horticultural Commissioner H. P. Stabler's office half a dozen cherry, plum and prune branches which had no fruit because they had been encased in mosquito netting, though the rest of the orchard is loaded. The story will appear soon in Pacific Rural Press.

Citrus and Semi-Tropical.

Picking of the Valencia orange crop in the Lindsay district will start about June 10.

The first figs of the season of 1917 season was received in Los Angeles last week from the Coachella valley. They were sold at \$1.00 per pound.

A car of Valencia oranges were sold at Azusa last week for \$2.50 for shipment to Alaska. This is the first sale of Valencias by the A. C. G. Exchange packing houses this season.

M. W. Tilden of Arlington, Cal., has just set out 245 Placentia walnut trees, 175 late Valencia, 120 Marsh seedling grapefruit, and 30 miscellaneous deciduous fruit trees.

The Banning Almond Growers' Association is preparing for a big crop of almonds this year. Last year's crop was 325 tons and this year's crop, it is thought, will be larger.

The first full car of olives packed by the Lindsay Olive Company to be shipped from Lindsay left May 15. The car contained 1,200 cases of 24 cans to the case.

J. W. McClymonds, vice-president and general manager of the Pacific Fruit Express, estimates that the California orange crop will be 10 per cent greater than last year. About 50,000 cars of citrus fruit will be handled this year, of which 2,700 cars already have been shipped.

The packing houses included in the A. C. G. Exchange at Azusa estimate that they will handle 1,500 cars of Valencias this season with a net return to the growers of about \$900,000. Shipments for the navel season just closed reached 2,000 cars and netted the growers \$1,000,000.

Shipments of oranges through the California Fruit Growers' Exchange from the Covina valley for the season so far have been 367,107 boxes. In cars the shipments have been 850 cars against 576 cars last year. It is said that the Exchange has 4,000 boxes of miscellaneous fruit still to ship which will bring the total up to 371,107 boxes for the winter season.

It is announced from Redlands that the fruit growers of Southern Califor-

KILLEFER
QUALITY

Model Bean Cultivator

KILLEFER
EFFICIENCY

This Cultivator, like most of our implements, has been developed at the request of Dealers and Ranchers for a strong, simply controlled cultivator, capable of doing their work deeper and better than possible with the light Eastern-made tools. The frame is one piece of high carbon steel without joints to work loose or sag and holds the wheels always true and in line with the rest of the machine. The double frame bar gives ample clearance between the standards and eliminates the tendency to clog in trashy ground. This frame bar has a double lifting device which holds it rigidly on both sides. A man's weight on the extreme end will not spring it out of line. The seat is set far enough back to give an unobstructed view of the rows and the foot control is very easy on the driver.

An important item for the Bean Growers' consideration is that all parts and repairs are easily and quickly obtained without the delay of sending East for them.

Place Your Order Early

There will be a shortage in the supply of
BEAN Tools this year.

The Killefer Manufacturing Co.

"The Schmeiser Way Makes the Farm Pay"

If you are paying more than 35c per ton for stacking your hay, you are losing money. You can stack it for less than that if you use the

SCHMEISER IMPROVED PORTABLE AUTOMATIC DERRICK,

"The World's Greatest Hay Stacker,"

Stacks hay baled or loose, Saves Labor, Saves Time, Saves Money. More Schmeiser Portable Automatic Derricks are sold on the Pacific Coast than all other hay stackers combined. The reason is:

"The Schmeiser Way Makes the Farm Pay."

For particulars, write today to

SCHMEISER MANUFACTURING CO.

12 Mechanic St., Davis, Cal.

Manufacturers of

Sure Pop Almond Huller and Separator, 5 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises; Schmeiser Alfalfa Land Leveler and Checker, and

SCHMEISER IMPROVED PORTABLE AUTOMATIC DERRICK.

nia are feeling the effects of the agitation for a maximum food production and conservation of the food supply for war use, for orange prices have gone down steadily the past few weeks in the face of much smaller amount of fruit being marketed. Oranges are selling lower now than this time last year and it is said the only reason is the effect of the world famine talk on the people back East.

Sutter county fruit crop conditions are reported by Horticultural Commissioner Stabler as follows: Grapes about three-fourths of a crop on account of frost. Peaches hurt by frost but the same tonnage in prospect as last year, due to young orchards coming into bearing. The Tuscans and Johnson clings in best shape. Prunes probably as heavy as last year, 95 per cent of normal. Almonds very spotted, but perhaps 75 per cent of total crop. Pears better than last year. Apples good, but only few grown. Cherries, a very good crop.

Grapes.

A big steam raisin drying plant is projected for Sutter county.

It is reported that the California grape yield promises to be much heavier this year than last.

Look for the story of advantages and construction of concrete sulphur houses in an early issue of Pacific Rural Press.

The California Associated Raisin Company was recently granted judgment for the collection of \$400 damages against a Fresno grower, who failed to make good on a raisin delivery contract for the 1916 crop.

The Fresno Chamber of Commerce says that the Eastern men are contracting for dried grapes at 3½ cents per pound to be used for sugar making. This is equivalent to \$14 to \$15 per ton for green grapes.

A number of fruit growers around Santa Paula have signed up their apricots at \$60 per ton for green fruit. Ordinary years the price ran about \$20 per ton. On this basis the price of dried fruit would be 18 cents per pound.

Taxes on California wines in the war revenue bill places a tax of 6 cents per gallon on dry wines, 20 cents per gallon on sweet wines and 20 cents on brandy used in fortifying wines. This is an increase of 100 per cent on sweet wines and brandy, and 50 per cent on dry wines.

Miscellaneous.

Imperial Valley farmers are mobilizing men, material and cars to ship 5,900 carloads of cantaloupes, the largest crop on record, out of the valley during this season.

The level of prices paid producers of the United States for the principal crops increased about 24.6 per cent during April. On May 1 the index figure of prices was about 95.8 per cent higher than a year ago, 87.1 per cent higher than two years ago, and 104.5 per cent higher than the average of the past nine years on May 1.

About 150 delegates, representing organizations of agriculturists and horticulturists of about two-thirds of the State, met at the headquarters of the California Fruit Growers' Exchange in Los Angeles last week and made a survey of the labor situation of the State. Reports indicated that there is a shortage of 10,000 laborers in the State.

Young Boys to Help Harvest Fruit.

The idea originating with Frank Swett, of having the young boys of the town schools organized to help in the fruit harvest, as printed in our columns recently, is to be put into practice in Contra Costa county. A camp is to be established near Walnut Creek, with facilities for handling about 70 boys, aged from 12 to 15 years, under the superintendence of a Boy Scout master. The camp is to be ready the latter part of June, and the expense of establishing it will be borne by George Rolph, superintendent of the California-Hawaiian Sugar Refinery at Crockett. Farmers near Walnut Creek may hire the boys for work during the day, but the lads are to return to the camp each evening.

THESE FARMERS WERE NOT MUFFLED MUCH.

[Written for Pacific Rural Press.]

The most representative meeting of farmers, the fullest and freest discussion of urgent farm problems by farmers only, was held in San Francisco May 21 and 22. It was called by the Agricultural Committee of the California Development Board under the guarantee of \$15,000 by the California Wholesale Grocers' Association to pay expenses of delegates, convention hall, etc. The committee named a leading farmer from each county in California as delegate to the convention, and 52 of these counties were represented. Discussion by delegates was spirited and general after the reading of each paper. Subjects discussed were: Practical Plans for Increasing the Agricultural Output of the State; Emergency Money at Low Rates for the Farmer During War Times; The Farm Labor Problem, Wages, Housing, the Effect of Liquor; and Manipulation of and Speculation in Food Products.

Resolutions adopted as summarized below, represented the sense of the farmers present quite fairly, though the labor resolution called out much discussion and the part relating to liquor was not put nearly so strongly as a large majority of those present felt, in view of the waste of over 100,000,000 bushels of foodstuffs used in liquor while the President is calling on the farmers to strain their prudence in producing more, and in view of the effect of liquor on the efficiency of the little farm labor we now have.

RESOLUTIONS APPROVED.

Present emergency warrants Government extending emergency credit to farmers at low rates and with extension of payment in case of crop failure, etc.

Government should guarantee minimum prices to farmers during war, to justify unusual production.

Legislation to eliminate hoarding food products, speculation in their prices, and manipulation of same.

Pure seed law modeled after pure food law.

This not the time to try new and uncertain crops and processes.

Farmers should increase quality and number of livestock and poultry.

Special effort to prevent injury to crops and animals by disease and pests.

One or more practical farmers should be included in National Council of Defense.

Try to make available labor supply the demand, and then get enough Oriental labor to meet requirements. (No provision for deportation at end of war.)

Information bureau needed at State Market Director's office where producers and consumers could register wants, prices, etc.

"We strongly recommend the National Government to forbid the use of grains in the production of whiskey and other distilled spirits (not including beer); and we look upon the saloon as a distinct menace to the production of food."

Chairman of Convention D. O. Lively authorized to appoint committee of 11, including himself, a member from the Development Board, a member from the Wholesale Grocers' Association, and eight operating farmers to carry out the purposes of the Convention. (Present delegates discontinued.)

Meeting the Universal Need

In the high passes of the mountains, accessible only to the daring pioneer and the sure-footed burro, there are telephone linemen stringing wires.

Vast telephone extensions are progressing simultaneously in the waste places as well as in the thickly populated communities.

Across bays or rivers a flat-bottomed boat is used to unreel the message-bearing cables and lay them beneath the water.

These betterments are ceaseless and they are voluntary, requiring the expenditure of almost superhuman imagination, energy and large capital.

Over the sand-blown, treeless desert a truck train plows its way with telephone material and supplies.

In the Bell organization, besides the army of manual toilers, there is an army of experts, including almost the entire gamut of human labors. These men, scientific and practical, are constantly inventing means for supplying the numberless new demands of the telephone using public.

Through dense forests linemen are felling trees and cutting a swath for lines of wire-laden poles.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

PUMPING OUTFIT PAID FOR ITSELF IN A YEAR.

[Written for Pacific Rural Press.]

Last year's increased prune crop on two acres paid for the motor, pump, well and electric power that increased the crop, and the labor of leveling and irrigation was done at odd hours. This is the experience of Samuel Fox of Tehama county, who was several years opposed to the "unnecessary" cost of an outfit and labor of irrigation. He was converted all through when last year's crop came on, and this year he is enthusiastic over the heavy crop set on the irrigated trees, "a great deal heavier than last year."

This two acres is part of four acres of prunes which had been yielding less than \$400 per year on account of drouth. Two acres are being leveled as time permits. These did not get water last year in any satisfactory fashion, and this year's crop is very noticeably lighter than on the other two acres. On the un-irrigated part half of the prunes dropped last year after the hot spell which affected most of the orchards in this district likewise. Practically none dropped on the irrigated part.

"I am positive," says Mr. Fox, "that I couldn't have sold over \$400 worth of prunes from the four acres last year if I hadn't had water. I did sell \$715.64 worth due to the increase on the two acres."

The pump and motor cost about \$150. The well cost about \$120, being about 80 feet deep. The power bill was around \$50. The concrete box and about 50 feet of concrete flume took eight sacks of cement. Gravel was taken from the creek a few feet away. The outfit cost only a little over \$320. The increased

crop was at least \$335. The four-inch pump is now installed free of cost and it will irrigate everything within reach, at a still lower cost for power because rates have decreased.

The pump was installed because the trees were dying for lack of summer moisture a year ago last fall. Fall well digging gave assurance that the water supply found would last all summer. Test with a bigger pump than the one used showed that the supply was inexhaustible. Mr. Fox's son leveled, leveled and irrigated about three-fourths of an acre in a day. Someone in the family last summer would turn on the power late in the afternoon. Mr. Fox would see if it was all right about 6:30 and would shut it off later. The time spent in irrigation was negligible. The two acres were irrigated again after the crop was off. That is why, thinks Mr. Fox, that the trees have such a heavy crop set now.

POWER NOTES.

The difference between the cost of keeping horses and automobiles, auto trucks, etc., has been constantly decreasing due to high feed prices and scarcity of horses.

Imperial County Farm Adviser P. I. Dougherty announces that he has on file for use of members of the Farm Bureau complete blueprints for power attachment to be used on Ford cars.

If time and horse flesh are of value on the farms this season, no one who can get an auto truck will drive a farm team slowly to town with a comparatively small load. Farmers are buying more trucks, or truck equipment for automobiles, than ever before.

LET THIS ENGINE REDUCE YOUR HIGH COST OF LABOR

The only way for a farmer to keep up with the always increasing cost of doing business, is to take advantage of the many MECHANICAL AIDS now provided for his benefit. In fact, no farmer who wants to do the most work in the most economical way can afford to be without a

FULLER & JOHNSON TYPE "N" GASOLINE ENGINE

To supply CHEAP POWER for operating an Alfalfa Cutter, Cream Separator, Churn, Corn Sheller, Electric Dynamo, Feed Grinder, Grind Stone, Ice Cream Freezer, PUMP, Spray Pump, Washing Machine, Wood Saw, or ANY FARM MACHINE equipped for power-drive this engine is a NECESSITY.

THE FULLER & JOHNSON TYPE "N" ENGINE is different from most engines. 1st—it is the product of 13 years of business and manufacturing experience, backed up with a world-wide reputation for QUALITY; 2nd—it is made in modern shops equipped with the finest machinery, by unusually high-class mechanics; 3rd—IT COMBINES THE GOOD POINTS OF HIGH PRICE ENGINES IN DESIGN, MATERIALS AND WORKMANSHIP—all the latest improvements—yet sells for a surprisingly low price; 4th—It is very, very simple, has few parts, is easy to start and run—by anyone; 5th—It has only one-fourth the weight of engines made from antiquated patterns—an. is more easily portable; 6th—It has "make-and-break" ignition, a "hit-and-miss" governor that keeps its speed constant and permits it to use very little fuel; 7th—It operates on the superior 4 cycle principle and cools itself perfectly; 8th—It runs equally well on gasoline or engine distillate.

The work the different sizes of this wonderful engine will do for you and the amount of money it will save will surprise you. You CAN'T AFFORD to be without it.

FARMERS' MACHINERY SCARCE.

Members of the special committee appointed by the National Implement and Vehicle Association to co-operate with the Federal Government in the movement to increase this country's food production met in Chicago May 18 and issued a statement calling attention to the fact that the success of the campaign will be seriously jeopardized because of a shortage of farm implements and to the inability of implement manufacturers to obtain but 75 per cent of the sheet metal needed to supply the normal demand of the farmers.

Attention is called to the fact that the farm implement manufacturers have practically no stock on hand, and that thousands of farmers in recent years have allowed their equipment to deteriorate to such an extent that many implements cannot be used this year without repairs.

The implement manufacturers declare they were compelled to appeal to the Federal Government recently in order to obtain 75 per cent of their normal annual supply.

Reports show that a great shortage in farm implements prevails. All factories making tractor ploughs are unable to meet the requirements of their trade. The corn acreage has been decreased by the shortage of listers, the tool necessary to plant corn in fall wheat fields. A shortage of regular corn planters is also imminent. This is occasioned by inability to secure raw material, particularly iron and steel products.

"The production of implements has been less than normal since 1913. Tools in the hands of farmers are more nearly worn out than ever before. Dealers' and manufacturers stocks are reduced. The increased food requirements mean increased acreage and more than the normal supply of implements is necessary if the situation is met. This condition is accentuated by a shortage of labor on the farms and necessity for increasing the proportion done with machinery. Implement manufacturers are making every endeavor to increase their production, but are actually faced with a decreased production because of their inability to get material.

"There are manufactured and sold to farmers in this country yearly approximately 100,000 harvesters and binders. A harvester and binder averages to cut fifty acres of wheat would result in decreasing the farmers' harvesting ability 1,250,000 acres. Allowing for the acreage production indicated by the Government in 1915 crop analysis of 16.9 bushels per acre, we would have a loss of 21,125,000 bushels."

KEEP THE PUMPS WORKING.

Owners of irrigation pumping plants throughout California are in a position to add greatly to the production of food supplies for the allies by selling water to their neighbors at a reasonable cost during such times as their pumps are not needed for their own irrigation, says the College of Agriculture of the University of California, after a thorough survey of the irrigation resources of the State.

An emergency law just passed by

the Legislature permits individuals to dispose of water without becoming public utilities and without incurring an obligation to continue to supply water in the future.

The committee on resources and food supply of the State Council of

Defense urges owners of land near pumping plants to make the charges to their neighbors as low as possible, in order to stimulate the continuous use of pumping plants throughout the irrigation season during the war period.

"It is better to spend 50 cents for oil than \$50 for a new part," says an agricultural experiment station writer. He might have added, "50 hours of lost time (more or less), 50 per cent loss of self-respect, and sometimes 100% loss of tranquility."

The Right Belt Way or The Wrong Belt Way

THESE sketches are used to illustrate an actual case. The user of the belt illustrated in Fig. 1 wrote us about his belt troubles. We suggested the arrangement as in Fig. 2. He was unable to carry out our suggestion, but did arrange it as in Fig. 3, with good results.

Test Special Belts

Do you have belt troubles? Do you get 100% efficiency out of your belt? Does it do all you expected of it? Does it separate in the plies and go to pieces?

We are belt engineers. We have been in the belt manufacturing business for nearly three-quarters of a century! We know by experience how to adjust belt difficulties, how to advise and help belt users.

All you have to do to obtain our help is to write us as fully as possible, giving a rough drawing, if convenient, telling what seems to stand in the way of satisfactory results.

We will cheerfully aid you in solving your problems to the best of our ability, without charge.

Write us about belts.

TEST SPECIAL belts are guaranteed to give satisfaction, or we'll make good on any proportionate basis that may be to your entire satisfaction.

That's the only way to buy a belt—that's the only kind of a guarantee that is worth having—you are the judge—it must be to your entire satisfaction.

WHEN you go to buy a belt, ask the dealer to cut off a strip an inch wide. Separate the plies with a knife as in Fig. 4.

WHEN endeavor to pull the plies apart, as in Fig. 5. If the plies can be pulled apart easily, it is a poor belt and not worth the price.

How Cows Pay for Ranch

[Written for Pacific Rural Press.]

The mistake new settlers often make is to pay all their capital on the land or improvements, not reserving enough to live on until a crop or two assure their living. Manuel Veter paid part of his ready money on 55 acres of river bottom in Tehama county about five years ago. But he needed an immediate income; so with most of his remaining money, he bought 18 or 20 cows. It has kept him and his wife busy without other help; but in the five years since then the herd has increased to about 50 cows and 25 or 30 calves and yearlings. A big hay and milking barn has been built, 27 acres put into alfalfa, and all but \$2,800 paid on the place which he now values at \$200 per acre. He has cleared eight or 10 acres from the wooded pasture for alfalfa, and is able to sell about 75 tiers of stovewood (8 by 4 feet, 16 inches long). Three bulls from the Vina ranch have been used and another is to be bought at their sale June 5, 6, and 7. Five bull calves were recently sold for veal. Seven cows have been sold when Mr. Veter needed ready money. No alfalfa has been taken off the place except a surplus of 30 tons last year. High grade hogs have been kept to use the skim milk, etc.; and a lot of them have been turned into money. Aside from this, Mr. Veter's income has been the regular cream check, which is about \$300 per month at this writing. Chickens have supplied the family poultry and eggs, while several hogs a year have supplied meat, lard, etc.

"If I had built a nice house with my first capital, I couldn't have bought stock," says he. "And if I had built a house since then I would have had to sell stock to pay for it. But now I am getting too old to care for so many cows," and may be it is time to build the home he and his wife have worked for so hard.

Experience With Concrete Stave Silos

[Written for Pacific Rural Press.]

A concrete stave silo erected last fall by M. L. Appleton of Stanislaus county kept his corn silage in perfect condition all winter and provided him with a supplement for alfalfa hay in his dairy cow ration.

Mr. Appleton used concrete silos in the East before coming to California and did not believe the wooden types would give permanent service, and as the solid types of concrete silos were rather expensive he selected a patented concrete stave that cost \$12 a foot erected, for the 12-foot diameter size.

The staves are two feet long, 10 inches wide and two inches thick, having a tongue on one side and a groove on the other similar to tongue and groove lumber. These staves are set on end, the joints of each course

being made tight by flat steel bands or hoops which encircle the silo and which is tightened at the ends by threads and nuts.

The entire structure rests on an 18-inch concrete foundation, but no floor was laid, the silage resting on sandy soil in the bottom. After completion the entire inside surface was gone over with a cement plaster which filled up all cracks and crevices, making it air-tight, as is indicated by an entire lack of leakage during the winter.

Last year Mr. Appleton filled his silo September 15 with Indian corn, but this spring he expected to silo a crop of barley while it was still green and follow with his corn crop, believing that in this manner he could better ripen his corn before danger of fall frosts.

Using Silage for a Dual Purpose

[Written for Pacific Rural Press.]

"If I didn't have silage I would go out of the dairy business." Such is the contention of J. W. Scott of Stanislaus county, who has one of the best herds of grade Jerseys in that part of the State and who is a careful observer of feeds and feeding.

Mr. Scott doesn't believe that the only advantage of silage is in its ability to balance an alfalfa hay ration, although he says that in physical condition alone the cows fed silage are enough better to warrant its use. But purely as a good farming measure silage is of great value to Mr. Scott because it allows him to harvest an immense amount of succulent feed from land which he wishes to rotate for alfalfa.

As an indication of how this works out in practice, he told us of his experience with three acres of old alfalfa last year that he cut three times before plowing up in mid-summer.

After irrigating and thorough and deep plowing and cultivation so that the seed bed was in "garden soil" condition he planted Orange County Prolific corn about July 10. At siloing time, late in the fall this piece of land produced an average of 17 tons of green forage to the acre which was sufficient to fill his silo.

In growing silage corn Mr. Scott finds that acclimated seed not only puts forth a better growth but that it is not bothered nearly so much by the corn ear worm as seed just recently imported from the East.

"It's Always at Home Sunday Evenings—

that's one of the good features of the EMPIRE Milking Machine," writes Mr. W. F. McCord, Iowa Falls, Iowa.

Were you ever inconvenienced by the absence of the hired man?—or of several hired men? Then how much worse if, on account of the existing shortage of hired help, you found yourself permanently short-handed. To prevent such a possibility, if for no other reason, you need

But there are other reasons: EMPIRE Milking Machines will save their entire cost in a short time by saving wages; almost invariably they increase the milk flow; they will enable your help to spend more hours per day in the field—and to have more leisure; they mean satisfied help.

EMPIRE Milking Machines are simple and efficient—gentle and natural in their action, and above all, they milk the SAME WAY EVERY DAY, more uniformly than even the calf. They safeguard the condition of valuable cows.

Let us tell you ALL the benefits they offer you. Write for Catalog 45—and ask also about EMPIRE Cream Separators, Gasoline Engines and Electric Plants.

Real HOLSTEIN Quality At Your Own Price

Our offering at the sale at Sacramento, Cal., May 31, 1917, consists of 10 highly bred females and 2 bulls.

One heifer whose first four dams average 34½ lbs. butter in 7 days, sire Spring Farm Pontiac Cornucopia, whose dam was the first 44 lb. cow, her dam a 31.70 lb. cow in our herd, who was sired by a brother to the twice 44 lb. cow Ormsby Jane Segis Aaggie.

A daughter of King Korndyke Sadie Vale, whose daughters are making such high records; her dam an own grand-daughter of Pontiac Korndyke, also De Kol 2nd Butter Boy 3d, both great transmitting sires.

A daughter of King Segis Pontiac, he being the best bred son of the great King Segis; her dam traces direct to Hengerveld*De Kol and Pontiac Korndyke.

Seven other heifers equally well bred. Most of these heifers are bred to our herd sire, King Segis Alcartra Abbekerk, whose first eight dams average 30 lbs. butter in 7 days.

The two bulls offered are both fine individuals and highly bred. One whose first six dams average 28½ lbs. butter in 7 days, sire Prince Gelsche Walker.

One a show bull whose dam has a 28 lb. 3-year-old record, with a good prospect for a much larger record; son of a 36 lb. bull.

ALL CAREFULLY SELECTED FROM OUR HERD
OF 125 HEAD.

Why it pays to

SALT YOUR HAY DOWN

When You Stack
It or Bale It—
BECAUSE—

It prevents musting

—checks the growth of molds when the moisture content is high.

Improves the feed

—cattle thrive on salted hay and they like its taste. Stock will eat it up clean, where unsalted hay will be mused over and wasted.

Increases the Milk

—makes the cows thirsty and they drink more water and produce more milk. Leading dairymen use salted alfalfa hay the year round for feeding their dairy cows.

Really Costs Nothing

—the salt more than pays for itself in the weight of the hay—holds the moisture, makes 5 tons equal 6.

20 Pounds of
Salt to Each
Ton of Hay

—that's the proportion. And the method is very simple. Stack three feet of hay, sprinkle the salt over by hand; then another layer of hay, more salt and so on.

Try It
This Year!

FEEDING FETERITA SILAGE.

[Written for Pacific Rural Press.]

After harvesting a heavy crop of oat hay on the sub-irrigated sandy soil on the M. M. Holdridge ranch in Stanislaus county last year, the land was seeded to feterita and cultivated three times after planting. It was also irrigated once when it was about a foot high and with this culture it made stalks as high as 14 feet.

A great deal of it was fed to the registered Holsteins in the green form as it was cut in the field, and they liked it fine, but all of it could not be consumed in this manner so a silo was erected with a capacity of 90 tons and the balance of it siloed.

During the past winter it has been fed twice a day to the milk cows in connection with two feeds of alfalfa hay and the same number of feeds of oat hay per day. While it was not quite so satisfactory as Indian corn silage, the cattle relished it and milked well on it, and in view of the immense tonnage that was secured it was considered highly profitable.

BREEDING AND CALVING RECORDS.

[Written for Pacific Rural Press.]

A simple but convenient way of keeping records of breeding and calving dates with grade dairy cows is in operation on the ranch of J. E. Bennetts of Stanislaus county.

Each cow is taught to go to her own stanchion at milking time and directly above her on the stanchions is a card bearing her name in good-sized letters. Underneath her name, in smaller letters, is her last freshening date, the date she was bred and the date she should calve. By this means the milker has each cow's record before him at each milking, and by simply glancing at the card he knows whether a cow should be bred, and whether she is freshening before her time is up.

CANNED MILK MIDDLEMEN.

[Written for Pacific Rural Press.]

A Modoc county merchant tried with cash to get canned milk from the manufacturer, to save the middlemen's profits. He was referred to the distributor who referred him to the jobber, who was the only one from whom he could buy the milk. Thus the consumer paid four profits including that of the merchant. This was told by P. S. Dorris at the farmers' meeting called by the California Development Board in San Francisco May 21 and 22. J. E. Shinn of Alameda county told how their dairymen's association raised the price of milk to producers without raising it to consumers appreciably, by organizing and compelling dealers to sign suitable contracts.

DAIRYMEN FIX CALF PRICES.

[Written for Pacific Rural Press.]

Buyers of newborn male dairy calves in Humboldt county have taken the stock at their own prices until this year; and the dairymen were far from satisfied. This year the Dairymen's Association said calves should bring \$2 each, and next day buyers appeared with the \$2 per. Similar experience with discard cows resulted as satisfactorily.

According to Herbert A. Emerson, who has been to the Pacific Coast investigating food conditions for the

Commissioner of the State of New York, the Pacific Coast this year will be able to ship East a surplus of 150

cars of butter, 24,000 pounds to the car. Four years ago the Coast imported 200 cars.

Has self-centering bowl; detached spindle

Every De Laval equipped with Bell Speed-Indicator

NEW DE LAVAL CREAM SEPARATOR

THESE are the days when you are getting *more milk in the pail*, and with butter-fat at its present high price you want to be dead sure that you are getting *all the cream out of the pail*.

You certainly can't afford to feed butter-fat to the calves and pigs at from 30 to 40 cents a pound.

All sorts of "claims" are made for various cream separators, but what you are looking for is "proof."

Here is the most convincing kind of proof that the De Laval is the cleanest skimming machine:

Fifteen years ago there were a dozen different makes of creamery or factory separators in use.

Today the creamerymen and large milk plants the world over use the De Laval almost exclusively. In fact, it's hard to find a large cream producer or creameryman who will allow any separator other than a De Laval in his plant, no matter what the price.

Why? Because they have found that it makes a difference of several thousand dollars a year to them whether a De Laval or some other make of machine is used. They simply can't afford to use any other machine.

This is proof of De Laval closer skimming that you can't afford to ignore. Even if you don't separate as much cream as the creameryman, you can't afford to waste it any more than he can.

Your local De Laval agent will be glad to let you try out a New De Laval on your own place. If you don't know the local agent, write to our nearest office for catalog or other information.

Purebred Registered
**HOLSTEIN
CATTLE**

All records for butterfat production in 365 days, not only Holstein-Friesian but those of all other breeds, were broken in 1915 by the registered purebred Holstein cow, Duchess Skylark Ormsby 124,514, when she produced 27,761 pounds of milk containing 1,205.09 pounds of butterfat. The test was made under the supervision of the Minnesota Agricultural College, thirteen different supervisors being employed. This wonderful cow freshened at the age of 3 years and 3 days.

Stanford Herd of Holsteins at Vina to be Dispersed

[Written for Pacific Rural Press.]

ON THE well-known Stanford Ranch at Vina—a principality in extent, containing nearly 60,000 acres—there have been raised for many years great crops of grain, hay, fruit and grapes, besides which were maintained magnificent flocks of sheep, herds of beef cattle, and the big purebred dairy herd of Holsteins. The trustees in charge of the Stanford University property have recently decided upon a change in the policy of conducting the ranch, this change involving the dispersal of their famous herd of fine-blooded Holsteins.

From the time this herd was founded by the late Governor Leland Stanford in the early 80's, it has been steadily improved by importations and the infusion of the best blood procurable. Governor Stanford bought his foundation herd from Peter Coutts, who had imported extensively for his ranch in Santa Clara county, where the Stanford University was afterwards established. Having entered into the breeding of registered Holsteins, Governor Stanford in 1888 sent Thomas B. Whales to Holland with instructions to secure a number of individuals that would work a decided improvement in the fine stock he had already purchased from Coutts. Whales returned with a big consignment. Under the direction of competent herdsman, the Stanford Holsteins were developed to a point where the herd was noted for the wonderful capacity of the cows and the great transmitting characteristics of the bulls.

In 1907 Lathrop sent Sam Houseman East for another lot of Holstein purebreds and the result was an addition of two more carloads of the best individuals that could be found in this country.

To the dairyman it will be of particular interest to know that the first A. R. O. work on the Pacific Coast was done in the Stanford herd. That was in 1901 when Estepilla made 17.13 pounds of butter in seven days. Since that time there has been more or less A. R. O. work done in the herd; the occasional tests showing a number of cows that have made better than 30 pounds of butter in seven days.

Nothing of a more convincing nature regarding the merits of the Stanford herd is to be had than the following opinion, voiced by George W. Wendt, the chief herdsman at Vina: "After spending practically all my life among Holstein cattle, during this time among some of the greatest herds in the East as well as the West, and after three years in charge of the Stanford herd, I am prepared to say that it is doubtful if ever before in the history of the breed in this country has a herd of its high standard been placed at public auction. I base my judgment upon my thorough knowledge of their production as well as their quality and individuality. It is what must be expected as a result of thirty-two years of constructive breeding."

We are told that in making his selections for a

UNDER MAGNIFICENT OAK TREES, ON SOME OF THE RICHEST LANDS OF THE SACRAMENTO VALLEY, FURNISHING IDEAL DAIRY CONDITIONS, THERE HAS BEEN MAINTAINED FOR SEVERAL DECADES THE GREATEST PUREBRED HOLSTEIN HERD IN THE WHOLE WEST.

foundation herd the two things that Governor Stanford demanded in every animal was conformation and production. The former he left to his own judgment, the latter to actual production, and failure to maintain a profitable production through a period of ten to eleven months would result in the consignment of the offender to the beef lot.

All of this is history, but in the present herd we have positive proof that his judgment was good, as, with the exception of the herd sires, the entire herd are descendants from the original importation, no females having been bought into the herd since that time.

The method of improving the herd has been that of improved methods of care, feeding, etc., and the greater influence of the use of the best sires that could be bought in its time. This, along with great fields of alfalfa and innumerable oaks for refuge from the summer sun, produced a condition very agreeable to the development of dairy cattle of this type.

The above illustrates the type of Holstein helpers on the Vina Ranch.

All down through the third of a century of constructive breeding there has been no lull in the interest in the herd. With the change of management at various times throughout this period, great care was exercised by the Board of Trustees in so organizing their force that there would be no deviation from the original schedule for its development.

Complete private records of production of each cow in the herd have been kept for a greater part of its history. This has aided materially in weeding out the unprofitable ones and building up and maintaining the very high standard that exists at the present time. The show-ring record of the herd is evidence of its very high standard of individuality. During the past year in the neighborhood of forty cows have made records ranging in mature animals from 20 to 32 pounds in seven days, with three-year-olds as high as 24.81 pounds and two-year-olds as high as 20 pounds. All of these were made without previous fitting in any way and in most cases were made in their regular place in the string and in charge of inexperienced men.

The herd sires now in use are:

King of the Pontiacs 14th, whose sire has about 200 A. R. O. daughters and is considered one of the greatest bulls of the breed from the standpoint of producing daughters. His dam, Alinde Burke, is one of the best daughters of DeKol Hengerveld Burke and a grand-daughter of Dekol 2d's Butter Boy 3d. Along with this breeding, he is without doubt one of the greatest show bulls in the West.

Dutchland Colantha Sir Ormsby 55055 is a son

of Colantha Johanna Lad, one of the breed's best proven sires, whose dam, Colantha 4th's Johanna, was the first and only cow to hold all world's records for butter production from one day to one year. His dam, a good daughter of Pontiac Burke, has a three-year-old record of 23.84 pounds in seven days and is rich in the blood of Duchess Ormsby and Pauline Paul. About forty of his daughters are now in the herd.

Segis Dekol Pontiac Burke 160339 is a California bred bull and used as junior herd sire at the Stanford Ranch. He is sired by the great bred show bull, Segis Pontiac Dekol Burke, who was a son of Riverside Sadie Dekol Burke. His dam, Miss Blaney, has a seven-day record of over 27 pounds and 1008 in one year.

The uniformly high standard of production of the herd as a whole and the great individuality that is in evidence throughout would cause the man with a knowledge of the disappointments confronted in the breeding business to sorrow at the thought of the dispersal of the results of the labors and accomplishments of a third of a century and regret that the principles of our mother country could not be applied, wherein, when age decrees that man retire from its active work, another generation takes the reins and labors on to a higher standard, as his forefathers have done, and thus perpetuate the work, on through the ages.

However, the dispersal of this great herd is in keeping with the policy of the Board of Trustees, who deemed it necessary to so combine the interests of their holdings as to make the administration safer and easier, not only for the present but for the future as well, when the entire system will have been rearranged.

The indications are that the sale will be the greatest livestock event ever staged in California.

Owing to the fact that there will be a large attendance on each of the three days, Sale Manager Tichenor has arranged for special trains leaving Chico each forenoon about 8 o'clock, and returning to Chico from Vina each evening after the day's selling. Arrangements are also being made

for the housing and feeding of the large crowd that will undoubtedly be present.

Even those who do not intend buying should make an effort to attend on this very unusual occasion, owing to the educative character of the sale and the opportunity of becoming acquainted not only with high-grade stock but with high-grade stockmen reasonably sure to be in attendance in large numbers. Numerous requests have been made of the sale manager for catalogs, and these will be forwarded as soon as received from the printer.

It is hoped that the purchases made at this sale will result in a wide distribution over the State of the blood of this outstanding herd, that California may attain and hold the pre-eminence in the dairy industry that its natural advantages and the efforts of its far-seeing pioneers seem to warrant.

Deutschland Colantha Sir Ormsby 55055, sire of 40 helpers in sale.

King of Pontiacs 14th, sire of 40 helpers in the herd.

Good Cows Best Any Time

When feed is high in price and hard to secure in any manner, the dairyman who has been culling out the boarders and using good bulls for a number of years is usually the fellow who does the least complaining, and such was the condition we found J. W. Scott of Stanislaus county in when we called on him in April of this year.

For eight years Mr. Scott has been building up his herd of grade Jerseys by the use of purebred, registered sires and for five years of that time he has been weeding out the poor ones for the butcher through the records furnished him by the Stanislaus County Cow Testing Association, which he has been a member of ever since its formation.

Mr. Scott's method is not so differ-

ent from that of other dairymen who practice good breeding and rigid selection methods over a term of years, and like others he finds that the producing capacity of his herd increases with each succeeding year.

Naturally he depends entirely upon his heifers increasing his herd average, expecting a heifer to produce 250 and 300 pounds of fat with her first calf, freshening at about 26 months. This allows him to secure an average for the herd of more than a pound of fat a day during the entire year which always allows him a satisfactory profit, for if a cow can produce more than her feed cost with cheap feed and cheap fat she can duplicate her work with high-priced fat even though feed is high also.

Developing a Cow's Feeding Capacity.

The reason that dairy cows sometimes go off their feed when being forced for record-making purposes is because they haven't been properly trained to eat as calves.

Such at least has been the observation of M. M. Holdridge of Modesto in handling the Creamcup herd of registered Holsteins.

The theory practiced with this

herd is that a heifer should be fed plenty of whole milk and some barley and plenty of alfalfa hay from early calfhood till such time as she is well developed, even though it take a year to do it, the idea being that by this means the animal develops a large capacity for feed and milk, and is able to care for greater amounts without upsetting her digestive organs when forced feeding may be desirable.

Efforts have been tried on the ranch in the past to secure the same results with skim milk but to no avail as the same rate of development has never been secured.

Milk is formed from the blood as it passes through the udder. A large flow of blood is indicated by large milk veins, the large veins that extend from the front of the udder forward along the belly. In a good dairy cow the veins are usually as large as a man's thumb.

Factory-made butter in the United States increased from 627,145,865 pounds in 1909 to 786,013,489 pounds in 1914; and factory-made cheese increased from 311,175,730 pounds in 1909 to 377,506,109 pounds in 1914.

Small top milk pails insure clean milk.

The Giant Of The Dairy

Grade up with a Jersey Bull! He is half the herd, and the breed determines half the profits. Breed him to your grade cows and bring the herd average near the Jersey average—489 pounds of butter fat per year. Your calves will be beauties. They'll mature quickly into gentle, hardy, vigorous and persistent milkers, long-lived and adapted to any climate. Let us tell you more about them. Send for our book, "The Story of The Jersey." It's free and it's a dandy.

Write for it now.

THE IDEAL GREEN FEED SILO

A FEW OF ITS SUPERIOR FEATURES

Doors and Door Frames are similar to refrigerator doors. Each door has three distinct bearings all around—two bevels and a rabbet—making a perfectly tight joint. Inside surface of doors is flush with silo wall, avoiding air pockets which cause silage to spoil.

All-Steel Splines joining two-piece staves interlock three staves, making a very rigid wall and air-tight joints.

Hoops and Lugs—Special Malleable Iron Lugs afford a straight pull on the extra heavy steel hoops, on which is a cold rolled upset thread, making threaded part of hoop as strong as the hoop itself.

Air and Water-Tight Foundation Joint.

Best Selected Materials—Careful Erection.

The Acme Feed Cutter and Silo Filler

with Alfalfa Meal Attachment

Rigid All-Steel Frame

Center Hung Blower

Six-Arm Blower Fan

Positive Safety Device

Low Feed Table

Large Flaring Throat

Large Capacity—No Clogging

Built in Seven Sizes

Alpha Gasoline and Distillate Engines

Hopper Cooled or Closed Jacket
Stationary, Portable—Semi-Portable.

Sizes 1½ to 28 H. P.

Equipped with a high-class built-in magneto—Batteries, Coils and ignition troubles eliminated.

Alpha Engines start on the Magneto without Cranking.

Easiest starting Engine in the market.

Long Life—Reliable Service.

Catalogs and full particulars gladly furnished to anyone interested in First Class Dairy Equipment.

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

Tulare creameries paid out over \$138,000 for cream delivered during April.

A Zurich milking machine has just been installed in the dairy of the James Mills Orchard Company at Hamilton City.

Glen Alex Queen De Kol, a two-year-old Holstein, in a recent test conducted by representatives from the New York Experiment Station, Cornell University, Ithaca, made 42.36 pounds butter in seven days.

In the article entitled, "Experience with Milking Machines," in our issue of May 12, there was a typographical error. Fred Austin milked 20 cows by machine in the same time as eight cows by hand. In the same article Favor Bros. should have been Fancoe Bros., Gonzales.

Hollow-Hill Farm, Redlands or Colton, Cal., has just issued a neatly printed booklet written to show the value of the purebred Guernsey bull or cow on the dairy ranch. It is entitled, "Why the Guernseys Are at Hollow-Hill Farm," and it will pay every dairymen, no matter what breed of stock he favors, to secure a copy, which he may do by writing to the above address.

There will be a special five-day course of cheese-makers at the University Farm at Davis, from Monday, May 28, to Saturday, June 2, inclusive, in which the methods will be taught of making "California Jack Cheese" and "California Half-skim Jack Cheese," two types now in unexpected demand because of the war time famine in foreign made cheese. "California Half-skim Jack Cheese" is a dry, firm cheese, excellent for grating.

The San Joaquin County Cow Testing Association is gradually enlarging and assuming an air of permanency. The dairymen are realizing that only by increased production can they keep pace with the increased cost of labor and feed. The five leading herds in butterfat production for the past month were: F. J. Kell, Stockton, 16 cows, 44.1 pounds butterfat; Gotshall & Magruder, Ripon, 17 cows, 38.5 pounds butterfat; O. Fowler, Banta, 24 cows, 35.9 pounds butterfat; M. N. Yokum, Bellota, 24 cows, 35.5 pounds butterfat; H. T. Bailey, Lodi, 50 cows, 32.2 pounds butterfat.

Beef Cattle.

The Roselawn Stock Farm at Woodland reports two sales of Shorthorn bulls. C. W. Clark & Co. of Lassen county bought four bulls and the Dibblee Estate of Santa Barbara county bought three bulls.

It is reported from San Luis Obispo that the Cajo ranch has sold to a Los Angeles packer all its cows at 7½ cents per pound in Los Angeles, and its steers to be delivered in Los Angeles between June 10 and 15 at 8½ cents per pound.

Swine and Swinemen.

The Delta Farm and Livestock Co. report the sale of sixteen young Duroc Jersey sows and one boar to Mr. A. Gregory of Redlands, who is going to sell his white sows, and go into Duroc Jerseys.

"Advancer of River Bend Farm" (St. Helena) on her third birthday, May 15, farrowed a litter of 16 Duroc pigs. She is the sow that brought in to her owners the sum of \$444 in one year, the culls going to the block being included in the grand total.

A. L. Bovo of Byron is establishing a herd of registered Berkshires, having purchased two pure-bred sows and the grand champion boar at the 1916 State Fair, from H. L. and E. H. Murphy of Perkins. More females will be added to the herd as soon as accommodations can be provided for them.

As a result of the missionary work done by E. Gates for the Berkshire hog, a number of new herds have been started in Contra Costa county. Mr. Gates, who breeds Berkshires himself, has created a good home market among farmers in his neighborhood, where several have replaced their grade herds with pure-breds for pork.

R. H. Whitten of Los Angeles, secretary of the newly formed California Poland-China Breeders' Association, reports a hearty response to his appeal for membership. One breeder who recently joined wrote: "I think any man who is in the Poland-China business and refuses to dig up a dollar to support the association is a pretty small potato."

The formation of the Southern California Duroc Jersey Breeders' Association last year, was a long step towards stabilizing the breed. Persons not already members of the association, interested in the production of better Durocs in Southern California, should send their names to R. K. Walker, secretary, Devore, San Bernardino county, Cal.

Sales of Hampshire swine from the Bella Vista Hampshire herd last week are reported of 21 head, consisting of four shipments to Davis, Dixon, Tamales and Modesto. Included in the Modesto shipment was Berkeley King Grand Champion Hampshire boar of the State, 1913. Bella Vista Hampshire sows are evidently doing their share to reduce the high cost of meat, as three of them within a week produced 40 youngsters.

R. H. Whitten of Los Angeles reports the following recent sales of registered Poland-Chinas from his ranch at Terra Bella: W. L. Champalin, one boar; D. H. Forney, Fresno, one more bred gilt; P. Madaule, Terra Bella, one boar; Geo. M. Queal, Pixley, one boar; F. C. Splane, Calipatria, 13 bred sows; A. J. Williams, Pilot Hill, one bred gilt; Mrs. M. F. Wilber, Brawley, one boar; Mrs. Bessie B. Ware, Live Oak, one boar and two bred sows. Prices ranged from \$25 for the cheapest boar to \$125 for the highest-priced bred sow.

The Llano Colony in Antelope Valley, Southern California, has recently purchased from Peters, Lamson & Walker, of Devore, Cal., Col. The King, the highest-priced boar ever sold by that firm. Professor Thompson, at the last Riverside fair, commended this boar very highly. Col. The King was shown at the World's Fair together with five of his little mates and all won prizes. Several other purchases were made from Peters, Lamson & Walker, aggregating 23 sows and one herd boar in the last 18 months. Visitors are always welcome at the Devore ranch.

A note from Prof. Thompson, secretary of the California Swine Breeders' Association, states that the proposed hog sale to be held at the State Farm on Swine Day, May 30, has been called off because sufficient entries were not available. The annual meeting of California Swine Breeders will, however, be held on that date, commencing at 10 a. m. The Poland China, Duroc-Jersey and

Berkshire Associations will also meet on that day. Everybody invited to attend these meetings.

Sheep.

J. C. Fowler of Pomona has just sheared three Montana Merino sheep, getting a total of 35 pounds of long wool.

It is said that E. G. Zalud, east of Porterville, has just returned from Mexico with 6,000 lambs, which he will feed for market.

Horses.

The sale of many horses has been caused by the high prices of feed, and machines have taken their place.

Livestock Miscellaneous.

The Danish Creamery Association of Bakersfield propose to erect a cheese factory at an early date.

Wool from Iceland, cotton from China, beans from Brazil and lobsters from South Africa are among the eccentricities of commerce in these days of high prices and interruption of the usual trade currents.

Cattle methods in California must be changed, according to Professor Gordon H. True of the State University Farm at Davis. Cattle must be fattened on cultivated crops in the valleys, for ranches are stocked to the limit now and Californians must come, to more intelligent and careful raising of beef stock, he says.

The prices of meat animals (hogs, cattle, sheep and chickens) to producers of the United States increased 9.4 per cent from March 15 to April 15. On this date the index figure of prices for these meat animals was about 49.2 per cent higher than a year ago, 77.7 per cent higher than two years ago, and 67.2 per cent

higher than the average of the past seven years on April 15.

Fifteen hundred acres will be double cropped by the James Mills Orchard Company at Hamilton this year. The barley is now ripe and most of it is expected to make 30 sacks per acre. As soon as the barley is off, the land will be irrigated and planted to sorghums. No grading will be done, but irrigation will be by the contour system with ditches along the high lines. The first units of the irrigating plant are now being installed, consisting of three 8-inch American pumps, each having a capacity of 2,000 gallons per minute, one driven by G. E. motor and the others by 30 H. P. West Coast distillate engines. There will also be a portable gas engine driven outfit of 1,200 G. P. M. capacity to pump water from the creek. The sorghums will be fed to hogs, sheep, dairy and beef cattle on the ranch.

The Splendid Fair at Chico.

The Butte County Agricultural and Livestock Exposition, which opened at Chico on Monday of this week, has proven a most gratifying success to its projectors and patrons in every way. The attendance is large and the exhibits of the best. Tuesday was a red-letter day in the Exposition's program, when Mayor Rolph and the San Francisco Chamber of Commerce excursion arrived to lend eclat to the occasion. Our worthy Mayor was much impressed with the high-grade stock on exhibition and parted with \$500 for some fine pigs and heifers.

Some of the livestock entries are: McLouth & Dado, Orland, 6 Jerseys; Bridgeford Co, Knightsen, 1 Holstein

1. MANTECA WALKER SPOFFORD LYONS 2. MANTECA GELSCH SEGIS LYONS

Both ready for service and both sired by JUDGE LYONS, whose 7 nearest dams average over 32 lbs. each, with average 30-day records of over 125 lbs.

Closely combined in this bull we have KING SEGIS, KING WALKER and COLANTHA JOHANNA LAD, among the most noted bulls of the breed.

The dam of Bull No. 1 above is LOT-TIE WALKER SPOFFORD 3rd, an 18-lb. 2-year-old daughter of the five times 30-pound cow LOTTIE

2 WONDERFUL BULLS AT AUCTION

WALKER SPOFFORD, the most persistent producer of the breed, out of the KING OF THE BLACK AND WHITE, whose 7 nearest dams average over 32 pounds in 7 days.

The dam of Bull No. 2 above is GELSCH SEGIS 2nd, a 23-lb 3-year-old daughter of one of the best daughters of KING SEGIS. Her sire is KING COLANTHA CLOTHILDE, son of a 31-lb. cow out of COLANTHA JOHANNA LAD.

THESE BULLS ARE TRULY WONDERFUL.

Powell, Chico, 1 standard bred stallion; Oroville Jack Co., 4 jacks; C. J. L. Stonebraker, Chico, 5 Toggenbergs.

Great Holsteins to be Sold.

The most particular Holstein breeder ought to be able to make a selection from the great offering of young bulls at the Sacramento sale on May 31st.

Besides Pride Valdessa, consigned by the Palo Alto Stock Farm, mentioned in our last week's issue, there will be a grandson of Tilly Alcartra out of a twenty-eight pound granddaughter of King Segis, consigned by J. G. Gibson Company of Williams. The Toyon Farm Association of Los Altos will contribute a young bull whose dam has a record of 33.28 pounds in seven days and is a granddaughter of King Fayne Segis, who sired the only fifty-pound cow in the world. This bull's grand dam on his sire's side has a seven-day record of 32.87 pounds. Of two bulls consigned by the Bridgeford Company of Knightsen, one is the son of Prince Gelsche Walker, and his first six dams average 28½ pounds. The other is by a 36-pound sire and out of a cow with a 28-pound three-year-old record. The Henderson Company's offering includes two bulls sired by Judge Lyons, whose seven nearest dams averaged 32 pounds, and who are descendants of King Segis, King Walker, Colantha Johanna Lad and King of the Black and Whites, the most noted bulls of the breed.

LIVESTOCK DIRECTORY.

Rates in this directory, 3c per word each issue; or if carried weekly for one year, 2½c per word.

SWINE.

Poland-Chinas.

MAKE BIG MONEY with our famous Whitten Ranch Big Type Poland-Chinas. Prolific breeders and profitable feeders. Grow rapidly, fatten quickly. Top the market at 225 lbs. in six months. FEED, FREE RANGE, State, Government land, any amount. Booklet free. Joseph Clark, Sacramento.

Bull Preparedness for Beef Growers

[Written for Pacific Rural Press.]

For the first time in many years the range cattle grower who wishes to use registered bulls finds it extremely difficult to fill his requirements at a moment's notice. Many instances are cited in which the prospective buyer is reported to have been compelled to buy grades when he had expected to buy purebreds because of his delay; and such reports are always more prevalent at this time of the year.

Time was when such a condition could be repaired by Eastern purchases; but at present the dilly-dallying buyer has great difficulty in picking up service bulls there also, even at values that would have staggered him a few years ago. Under such circumstances, it is natural that the question be asked, what are we going to do about bulls? It is an absorbing question to which there can only be one answer—"bull preparedness."

SELECT YOUR BULLS IN TIME.

To experienced users of registered bulls, this is not a new idea as witness the following statement by W. Mayo Newhall, of the Newhall Land and Cattle Co.: "In our cattle operations we have found it unsatisfactory to depend upon buying our registered range bulls as two-year-olds for immediate service. Experience has taught us that we can buy our bulls cheaper, get a better selection and get better percentages of calves by purchasing them as short yearlings."

"When possible I prefer selecting my bulls before they are weaned, getting in this manner the pick of the breeder's supply, and allowing them to stay on the breeder's ranch till they are about a year old. We then

take them to one of our coast ranches where they are run on the best of feed, becoming acclimated and hardy for service as two-year-olds. The great trouble with too many cattlemen is that they do not figure far enough ahead but wait till the last minute to buy their bulls. Then the supply has been culled over, the bulls are put to hard service under different conditions than they have been used to; and when unsatisfactory results are secured, the grower blames the bull rather than himself. We never figure on less than an 85 per cent calf crop and believe there is a distinct improvement in the weight and quality of our steers."

NEVADA EXPERIENCE.

Similar experience and advice to that of Mr. Newhall's is this from H. F. Dangberg of Minden, Nevada, whose successful operations in a large way need not be commented on among practical cattle raisers.

"We try to buy our range bulls as weaners," states Mr. Dangberg, "because we have found that they can be purchased cheaper at that age, the cost of shipping them to our ranch is less, and they have a longer period to become acclimated before being put into service."

"We feel that a bull should attain an age of at least two years before being put into service, so that his growth may not be stunted."

"Our facilities for handling yearling bulls are just such ordinary conditions as will enable us to keep them separate from the other classes of stock; and we give them just good ordinary care for the purpose of acclimating them and getting them in range condition, not endeavoring to produce a fat, flabby individual."

"We have sometimes experienced difficulty with bulls raised on valley lands and pampered (presumably by box-stall feeding—Ed). But if the bulls are bought as short yearlings and handled in a way to make them rough fellows, this trouble can be averted."

"I find some difficulty in buying bulls of serviceable age; as such bulls, bought in the East, are not suitable for range purposes under ordinary conditions. We do not encounter the same trouble in securing yearling bulls; as the average breeder, under ordinary circumstances, is willing and anxious to cash the bulls at the earliest possible moment."

"The difference in value between yearlings and short two-year-old bulls should be about the difference of cost of keeping, plus interest on the investment, and insurance which would be about \$30."

To corroborate Mr. Dangberg's last statement, a prominent breeder of California is authority for the assertion that while he offers the pick of his yearling bulls at \$150, he asks and receives \$200 to \$250 for bulls of a serviceable age. He considers this spread in price necessary to cover labor and feed costs during the holding period; but admits that the buyer pays for a service that he might more economically perform for himself.

That the matter of acclimatization is of more than ordinary importance, especially in poor grass seasons, is asserted by Robinson Bros. of Merced county, who state that when bulls are bought and turned on the range

BASSETT'S POLAND CHINAS

GRAND CHAMPION BOW, P. P. L. E., 1915; Sacramento, 1916.

For many years at widely separated show rings, under many different judges of varying type ideals, my Poland Chinas have been consistent prize-winners. My herd is large and I cull closely. The animals sent out as breeders are the very tops of a large number. I KNOW that my kind of Poland China is a profitable farmer's hog, for I send carloads of them to the packer every year—uniform in size, high in quality, quickly and economically matured and finished.

Young stock, \$30 Up.

R. F. WILSON, Stockton, Cal.

at serviceable age they do not stand up to the adverse conditions. This they think is not so pronounced with bulls that have become accustomed to feed and range before being put to service, although they also believe it is a mistake to put yearlings into service.

NO GRADE BULL IS CHEAP.

Naturally opinions differ on this, as well as on any other subject where conditions differ, and while F. G. Stevenot of Calaveras county agrees with the above, so far as breeding of his bulls is concerned, his feed conditions warrant a different viewpoint on bull buying.

As to the advisability of buying registered bulls he says this: "Much can be said about this bull question, the main thing being good blood. Always preach the good results from registered bulls. No grade bull is

cheap. One always loses enough by his use to make him expensive."

With well fenced pastures, good feed and not too much service, Mr. Stevenot does not experience any difficulty with bulls bought at a mature age but he does not believe in using bulls younger than 18 months and prefers them being two-year-olds. If used before that time their growth is retarded, particularly if they are allowed to run free with the cows.

BREEDERS TOO FAR APART.

In the carrying out of a preparedness campaign as above outlined, there has been one outstanding difficulty experienced by buyers: the distances between breeding establishments and a consequent loss of time in personal selection. Many times, it is said, orders are sent East because of this and the further difficulty in assembling carload lots in one locality.

Buy a mature bull whose heifers are better producers than their dams.

Approximately twenty per cent of each potato pared by ordinary household methods is lost in the process.

Home-Made Pork Products

To the Editor: I would like to know a practical way for a farmer to put up pork for future use at this time of the year, as I can only get 9c per lb. on foot.

I have been using a brine of 1 1/4 lbs. of salt and 1 lb. of sugar to the gallon of water—boiling same for half hour and letting it cool before putting the meat in. I have kept bacon in the brine three weeks and hams and shoulders six weeks, then smoke them and I have always had good meat. I have cooked sausage as soon as made and put down in stone jars and cover with hot lard.

I have a good tank house, ceiled and the space between the siding and the ceiling filled with sawdust. The hog I have weighs about 150 lbs. Any information you may give will be thankfully received.—C. W. H., Healdsburg.

[In parts of California where the nights are cool, home butchering and curing can be successfully done at this time of the year. Avoid hot spells of weather, do the killing and dressing in the late afternoon, cool the carcass by hanging in the open air during the night and get everything ready to cut up and get in the brine in the cool of the morning. Your methods are good. Others like them can be had by sending to the College of Agriculture at Berkeley for a copy of their Circular No. 151, which contains also suggestions for farm butchering of hogs.—Editors.]

FEEDING THE PIGS SEPARATELY.

It is generally agreed that the cheapest gains on a hog are made during his early life and this is emphasized if the sow's milk is supplemented with skim milk and a little grain after the pig is about three weeks old.

As it is not the object in most cases to feed the sow a fattening ration while she is still suckling her pigs, the most practicable way to furnish the pigs with the desired ration is to provide a separate trough for them, to which the sow cannot gain access. This is accomplished on a ranch recently visited by the use of two panels set in an A shape against the division fence of the pen. A small space was left where the two panels joined, large enough to allow entrance to the pigs but too small for the sow. A small trough set inside the enclosure allowed of feeding the pigs a separate ration and in this way the pigs weaned themselves at an early age.

CUTTER'S BLACKLEG PILLS

"California's Favorite" for nearly 20 years

For the Prevention of Blackleg in calves and young cattle

Their superiority is due to nearly 20 years of specializing in "Vaccines and Serums only."

Year in and Year Out they give better satisfaction than any other vaccine made, and the cost of a few cents per dose is cheap insurance against a disease that always takes the fattest and best.

Single Pills may be used for ordinary and range stock.

Double Pills should be used for pure bred and high grade stock.

Use any Injector, but Cutter's simplest and strongest.

Prices:
10 dose pkge. Single pills \$1.00
50 dose pkge. Single pills 4.00
10 dose pkge. Double Pills 1.50
50 dose pkge. Double Pills 6.00
Cutter's Pill Injector.... 1.50

Insist on Cutter's. If unobtainable, order direct.

Write for new booklet, "The Control of Blackleg." It tells about Anti-Blackleg Serum which cures Blackleg and may be used simultaneously with vaccine to combat outbreaks and safely protect valuable stock.

Raising Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Brittle Shells.

To the Editor: What is the cause of brittle shells in Plymouth Rock eggs in hatching? Chicks die in shells.—R. A., Walnut Creek.

The brown eggs, no matter what breed, are always hard and brittle. They do best hatched under hens in a place where the ground can be moistened. When hatched in incubator, use moisture on the floor of building—enough to keep the atmosphere a little damp. I am now experimenting with a powder that is supposed to rot the shell. If it is good I will tell of it in the Press. So far we have not any remedy for chicks dying in shell from hard shell except the moisture.

Chickens Have Black or Dark Tips on Comb.

To the Editor: Had a hen die. Opened her and found her full of eggs, liver was very large and very dark colored, full of tiny white spots like a pin point; heart small and full of dark red blood, as were main arteries and oviduct. Was not sick, but died as she was getting on nest. Have given flock a week's Epsom salts for internal fat, and hens are laying fine. Feed mash, wheat, gyp corn, soaked oats, etc.—Mrs. C. F. S., Galt.

Your trouble is with the feed. The hens have had bad cases of indigestion which you have not noticed. I don't know anything about the mash you mention, but I do know this, that very many complaints that come in are from people using this same mash. This does not mean that the mash is not good, but I think it is too highly concentrated to be fed wholesale. You should feed a certain amount, say just what you can hold in your hands, for ten hens one day and give them no more. If you cut down on the mash you may not get quite so many eggs for awhile, but they will come back after having grown used to the lesser quantity and they will not die. No, do not use the acid more than four or five days. A better remedy now would be plenty of green alfalfa mixed with the mash and ten drops of tincture of Nux Vomica in a quart of water once a day for a week, and cut out some mash and corn.

Rabbits Dying.

To the Editor: I had seventeen rabbits, from one to three months old. During the winter I fed them alfalfa hay containing a lot of foxtail. About April 1 I started to feed green alfalfa and they commenced to die. My buck and three does are healthy. What is the matter?—L. P., Ripon.

The matter is that you have fed your young rabbits alfalfa that has been touched with frost. The only reason the old ones are not dead is because they are stronger and could fight off the effect. Alfalfa has been not exactly frozen this spring, but just a little touched, and young rabbits are very sensitive to such things; also to change of feed, and when you change from dry feed to green feed, even if it is perfect, it pays to be careful, and when you give green feed give no water; when you give dry feed give plenty of water. Better spend a dollar for "Rabbit Culture," for sale by F. H. Snow, Petaluma.

Turkeys Have Blackhead.

To the Editor: Two of my young gobblers, five months old, died with what is called blackhead. About three more are drooping. Please tell me if there is a remedy? Also what is the cause of young turkeys' feet curling up so they cannot walk. Is there a remedy for this?—Mrs. L. B., Aromas.

Some times young turkeys die from a disease that is similar to blackhead, but not so hard to cure. Try giving them one of Carter's little liver pills, 25 cents a box at druggists. If the liver is out of order these will help. For true blackhead there is very little hope. Read last week's Press and see what is said on turkey diseases. Be sure you clean up your yards where the young birds hang around; plant something in it if possible, but anyway dig it up. For the curling up of feet, give 15 grains of iodide of potassium to one quart of water, and see that they get no other water to drink until that is gone. Keep this up until relieved. The trouble is rheumatism and they must be kept warm and dry. Plenty of litter to scratch in is very helpful in such cases.

Fuller Information Desired.

To the Editor: Will you kindly tell me what my chickens are dying of? They are comfortably fixed and let run, were laying fine. They go around drooping, stop eating and last but a few days before they drop off the perch dead.—Mrs. J. W. F., Modesto.

Your information is so very meager that it is hard for me to tell you. I don't know whether your chickens are fed anything or nothing, as you forgot to say. I don't know whether they are fat or thin, so you see whatever I can tell you is mere guess work. However, I think your chickens are eating something on the range that is poisoning them, maybe dead gophers, squirrels, or birds; but it appears like ptomaine poisoning. Keep them in a yard awhile. If it is poisoning, sour milk is as good a remedy as anything. Send me fuller information and I will try again.

Prices of Eggs.

It is reported that in the East eggs went down as low as 28 cents a dozen on March 12, then began to climb again and kept on climbing gradually until at middle of April they were 38 cents a dozen. But owing to the influx of Chinese eggs, we on this Coast are still way below Eastern market prices. We are supposed to have a pure food law that does not allow incubator eggs to be sold on the market. If this is a fact, I would respectfully call the attention of the "pure food" commission to a letter published in the "American Poultry Journal" from a Chinese student at the Missouri University. H. Lum Chung says in his paper, telling about Chinese incubation, that as early as the fourth day the eggs are tested and the infertiles sold as fresh eggs. And there is not much doubt but that these eggs find their way to our markets, and are sold as fresh eggs. Of course even a pure food commission has to have proof before they can work, so it is up to some of our large poultry men to investigate and find out if this is so, then pass their in-

formation along to the proper authorities.

According to the price of feed, we are all perfectly satisfied that eggs should advance higher than they are, and it may be that this is one cause why they do not.

PROFITABLE POULTRY ON A DAIRY.

[Written for Pacific Rural Press.]

Poultry form no inconsiderable portion of the income secured by A. M. Bibens of Stanislaus county, in spite of the fact that they are largely fed on by-products of his dairy farm.

Mr. Bibens aims to have 1,000 hens on his ranch at all times, always buying them as pullets because he is able to pick them up for 55 to 60 cents apiece from people who are going out of the chicken business, and at that price he does not think he can afford to raise baby chicks.

Milk and green feed naturally constitute a large part of the ration used by Mr. Bibens, but as he does not yard his birds they pick up much feed in the straw and waste hay around the cow corrals. All milk fed is well clabbered in barrels before feeding.

Early in April Mr. Bibens was securing 700 eggs a day from his flock and was feeding a large bucketful of Egyptian corn, one of oats and one of wheat in the evening and a third of a bucketful of each grain in the morning. These grains are fed on discarded alfalfa stems and straw, which is strewn around over the barnyard so that the hens have to do a lot of exercising to get them.

Alfalfa furnishes the bulk of the green feed, but a small field close to the buildings is kept for planting barley, the chickens being kept out till the grain is well sprouted in the ground. This also requires lots of scratching on the part of the hens who eagerly dig for the sprouted grain.

Large laying and sleeping houses are provided the birds, but except at night they have the run of the place. It is surprising, though, the small amount of foraging they do in distant fields preferring apparently to stay close to the laying houses.

SELLING SURPLUS HONEY.

Honey is 'one product of the farm which will practically market itself if it is properly prepared for the market. The marketing of a small surplus is a simple matter. Let your neighbors know you have the pure unadulterated article and they will be glad to relieve you of the surplus. The marketing of a large crop may not be so simple, as you may have more than is needed for supplying your immediate neighborhood or city market. For disposing of large surpluses advertising in newspapers is suggested. This will increase the demands from other cities and from a

large country district. For marketing a small surplus, glass jars holding three, six, or 12 pounds are convenient and attractive containers; but where a larger surplus is to be marketed, tin pails holding five or 10 pounds or larger quantities are more generally used.

Poultry—Purebred and Commercial

[Written for Pacific Rural Press by Harry Mortenson, Suisun.]

Chicks Dying.

To the Editor: We hatched 200 Rhode Island Red chicks and brood with hens. When chicks are a few days old they commence to die. Have some six weeks old that have extra large heads and general stunted look. So far have lost fifty and expect more will die. They are fed the best of chick feed; have specially clean quarters, fresh water and milk. Some have diarrhoea and some have wing feathers that are too long entirely, then they get droopy and die.—O. E., Stockton.

I think that the chicks are suffering from either head lice or mites. Your feed is all right, and the fact that you hatched an average of 11 chicks from 15 eggs set gives credit to the stock. Now, pick up a droopy chick, not a dead one, and scratch your thumb along the wrong way of the head feathers and see what you find. You can see much better out in a strong sunlight because head lice burrow deep in the chick's head, and one or two are sufficient to kill a chick a few days old.

If you find nothing there, then get out into the coop at break of day and look in the cracks and crevices for mites. You will find recipes in your "Poultry Practice" to fit both cases, and I am nearly sure that is where your trouble lies. Don't get discouraged; get mad and go for them with something that will make them hustle.

Growth on Hen's Beak.

To the Editor: We have a hen that has a growth that started between her eye and beak. It has now grown so that it completely closes her eye. It is not a sore, but is hard and red like her comb. Her comb is red and she appears to be perfectly well and is laying, but the growth seems to bother her in that she shakes her head. It is getting larger all the time, and I would like to know what it is and what to do to relieve her.—J. E. P., Muroc, Kern county.

The cause of the growth on your hen's beak is difficult to determine, but probably it is just an abnormal growth. If it does no harm and does not affect the hen's health leave it alone. You might remove it, however, with a sharp knife, taking care not to allow her to bleed to death. After the operation, powder the wound with iodoform, put the bird in a small clean coop and watch the wound for a few days.

Market Weight for Rabbits.

To the Editor: We have on hand about two dozen Belgian hares of three to four pounds which we wish to sell. We are not able to find a market so far, but we see rabbits regularly quoted in market reports, so we assume there is a ready and constant market. Would you put us in touch with some commission house or someone buying rabbits regularly? And could you tell us the most desirable weight and age for marketing.—E. F. N., Wendel, Cal.

You might advertise in our columns for a poultryman or write to the University Farm at Davis. A representative of a wholesale poultry concern in San Francisco informed us that the most desirable weight to market rabbits was from three to four pounds. The price last week was fourteen to fifteen cents per pound. Any poultry commission house will buy rabbits. In regard to age for marketing, that de-

pends entirely upon method of care and feed.

Toe-Picking.

To the Editor: Can you tell me what to do for toe-picking? My chicks are 12 days old and I find a great deal of it.—O. M., Madera.

Toe-picking is generally caused from the lack of ash in the ration or insufficient animal protein. The trouble is usually started by the taste of blood, one member of the flock becoming injured, or sometimes one little fellow will think his partner's toe is a worm and give it a pick. The writer has had good results with use of pine tar. Dip the injured toe in pine tar and turn the chick loose. As soon as they pick off all the tar, apply some more. One pick at the tar will usually cure them. Some use bitter aloes mixed with water; a nickel's worth will fix a lot of chicks.

No Pullets Being Sold.

Practically no pullets are being shipped to market. Old hens, however, are arriving freely, showing that the poultrymen are culling their

flock more closely this fall than ever before. This is a good thing, as no boarder hens will be kept over this winter. How about those old roosters that are eating their heads off. If they are not valuable as breeders, sell them or eat them and produce infertile eggs.

Plant Spare Yards to Greenstuff.

Hens at this season require less range than in spring. So if you have water, dig up those unused yards and plant them to kale, beets or corn, to cut down the feed bill.

Lock Up Broody Hens.

A broody hen when locked up soon after she shows signs of sitting, will lay in a few days. Every egg counts now-a-days. Don't let the setting hen spoil a lot for you. The quickest way to "cure" a broody is to place her in a coop with a slatted bottom and feed a good rich feed.

POULTRY NOTES.

Cold storage holdings of eggs as reported May 1, 1917, to the U. S. Dept. of Agriculture are as follows: The 288 storages that reported show a present stock of 1,739,692 cases as compared with 2,327,174 cases last year, a decrease of 587,482 cases or 25.2 per cent.

There was an increase of 260 per cent in poultry held in storage May 1, as compared with stocks of the same date last year.

Eggs in cold storage in Los Angeles May 10, 1917, were 64,994 cases against 51,064 cases the same date last year, an increase of 13,930 pounds.

Mrs. Best's Letter.

WEDDING GIFTS.

My Dear Friends: With the nearness of June—the month of brides and roses—perhaps some of you will be interested to know what the shops are showing for wedding gifts. To the immediate family is delegated the right to give flat silver and table linen, so it will be of other things we will talk.

Supplementary silver, such as trays, baking dishes, mustard pots, candle sticks, sugar tongs, salad sets and the like, make nice gifts and add much to the appearance of the table in the bride's new home. Silver is particularly good style now—a fact that some of us regret on account of the care necessary to keep it looking well.

Embroidered towels or pillow cases, or scarfs suitable either for dining room or dresser use, are welcome gifts and have the advantage of representing loving labor from the giver. A set of tea napkins, crocheted around the edge and having the initial in the corner, make a lasting gift and one that can be made at home at not too much expense.

In the furniture line there are attractive tea wagons in various woods and also in wicker. These can be in simple lines, with glass trays or in the more elaborate styles with a recessed top in which can be kept cups and other articles ready for use for afternoon tea. These tea wagons are useful for home meals as well as being ornamental for a company tea. These range in price from \$10 up, according to the style. Muffin stands are a novelty that might prove acceptable. These are in wicker and the hard woods and are about three feet high, with a handle to lift them around.

A nest of tables is a very attractive gift and when not in use for serving tea makes a very good looking table on which to place a vase of flowers. These nests have either three or four tables that slip out easily and make it possible to serve quite a company in a living room for a tea or a Sunday night supper. They come in teakwood, mahogany and lacquered ware. The lacquered tables come in various solid colors, with a border pattern worked out in gold or an indistinct pattern of flowers under the last finish. The prices range from \$15 up.

Lamps are having quite a revival of popularity, the ones for electricity being the most elaborate. The pedestal lamp, which is about five feet tall, with quite a solid base, is wonderfully pretty in a hall or large living room, but for the ordinary home the smaller light for the table is better. These pedestals are of metal or burnished wood in colors, old gold with soft blue and dark red being a popular combination. If the pedestal is metal, the shade may be a combination of metal and glass, but the wood pedestals are practically all surmounted with silk shades. These may be of soft shades of rose, blue, tan or gold or of flowered material. They are many times trimmed with a gilt braid and nearly always have fringe. The prices range from \$10 up.

Candlesticks of burnished wood are almost more popular than those of brass or silver. They are all simple in design and the candles are without shades. The color of the candle

THE HOME CIRCLE

depends on the color scheme of the room. These range in price from \$2.50 upward and are exceedingly good style and popular for gifts.

Mirrors make beautiful gifts and come at all prices from the large oval suitable to be hung over a fireplace or over a hall table down to the small hand glass with the long, burnished wood handle to rest upon the living room table. The last is a fad of the moment, but is very pretty while it lasts. The frames are simple in design, many of them looking like antiques. The frame is usually a dull gold in color and the prices range from \$5 up.

Pictures are good for gifts, but it is safer to confine your choice to standard prints unless you are certain of the surroundings in which the picture will be hung. Small pictures are many times framed in a pedestal frame to rest upon a table or mantel. These frames are in burnished gold with soft shadings of color harmonious to the picture.

ROSABELLA BEST.

SOME USES FOR HONEY.

To many people honey is just honey, as all sugars taste alike, but the initiated do not buy honey for its clear light color alone. The delicious honey served in Europe made from the heather is dark and thick. The buckwheat and golden-rod honeys are also dark and for cooking purposes are preferable to the lighter kinds. Of the lighter honeys the product of the clover is considered finest, and yet the orange, raspberry, magnolia, cotton and eucalyptus flavors are incomparable. The old idea that the one use for honey was as a sticky spread for hot biscuits is past. Many thousand tons are used yearly by bakeries. It not only gives a more delicious flavor, but cakes, cookies and gingerbreads sweetened with honey keep indefinitely. Honey candies are much finer than when sugar alone is used. Jams of all kinds can be made from fruit and honey, substituting honey for sugar. The fruit must be cooked before adding honey. If added in the beginning, the jam will be bitter. Stewed prunes, rhubarb and

cranberry sauce are very good sweetened with honey. Honey lemonade is also good. The Bar-le-duc preserves are easily made with honey, only taking care not to scorch the honey. These preserves do not require to be absolutely air tight, as honey is a preservative.—Mrs. A. S., Los Angeles.

ANOTHER USE FOR STALE BREAD.

Editor Home Circle: I was much interested in the article, "Use of Stale bread." I have another "use" that I think is real nice, and during these hard times when we all should be economical, thought it would help others as it does not only use stale bread but left overs from the table.

Take stale bread and crumb or cut into small pieces (not too fine), wet the crusts with a little water, cut up scraps of bacon, ham or any kind of cold meat, mashed or cold potatoes cut small, onion if you have it (good without), a little pepper and salt, and a dash of sage helps the taste. Add a little water, mix, put into a shallow pan and dot with a little meat fryings or butter. Bake until brown.

Beans, rice, corn or most any left overs can be added and is a good way to use up the scraps that probably would be thrown away.—Mrs. C. A. C., Potter Valley.

ORANGE GINGER SQUARES.

Heat together 2 cups of molasses and 1 cup of shortening, but do not boil. When the shortening is melted, take from the fire and cool. Sift 6½ cups flour, 1 teaspoon soda, ½ teaspoon salt and 2 tablespoons of ginger. Stir half of the flour mixture into the molasses and shortening, add 2 cups of home-made candied orange peel cut in small pieces, then the other half of the flour mixture. Set away to cool for 2 or 3 hours. Roll out ¼ inch thick, brush over with yolk of egg diluted with 2 teaspoons of water, cut in squares and bake in moderate oven. If the dough cannot be thoroughly chilled, use one-third to one-half more flour. All measures must be level.

CULTIVATION.

By Burgess Johnson.

My mother says I'm much too small To have a garden of my own. She says I take no pains at all To tend my plants, from spring to fall;

That's why they haven't grown. She says they can't get tall and strong Unless they're watered right along.

I want to let my mother know

That I can truly do a lot. I'm big enough to help, and so I'm making baby sister grow— She's such a tiny tot.

And things won't grow, the folks all say, Unless they're watered every day.

REMOVING STAINS.

Chloroform or benzine will remove paint stains if not too firmly fixed. In that case use turpentine.

Alcohol will not spoil the most delicate materials and is safe to use on most stains. It is very helpful for grease or pitch stains.

To remove iron rust and scorches on white clothing, wet the spots with lemon juice and salt and place in the sun.

Mildew can be removed by applying a paste of two parts soft soap and powdered starch, one part of salt and lemon juice to moisten. Apply on both sides of the cloth and put in the sun.

Grease spot on silk may be removed by placing the silk between two blotters and pressing with a hot iron and ether or benzine are good to use also.

Ink spots are very troublesome to remove. On white goods the spot may be dipped first in oxalic acid and then in hot water, repeating if necessary. Care must be taken that the acid does not eat the goods. On rugs or clothing cover the ink spot while still wet with flour, corn starch or corn meal, renewing as fast as the ink is soaked up. Then use lemon juice or sour milk.

LIVING COSTS.

The best way to dispose of left overs is not to have any. Use good judgment in amounts used and methods of preparation. Don't let the family tire of food which is wholesome and cheap by serving it in the same way. Rice may be served in so many different ways that the family will hardly recognize it. Remember that deep fat frying requires a lot of expensive fat. Better use some more economical way.

Don't throw out a little corn meal mush, cooked breakfast food, a spoonful of rice or anything of that kind. Put it instead into the pancake batter. Use bread crumbs from the stale bread to help out a meat loaf or escalloped dish, instead of in expensive puddings.

TOMATO SAUCE.

For ½ can tomatoes use ½ teaspoon soda, 3 tablespoons butter, 2½ tablespoons flour, ¼ teaspoon salt, pinch of pepper. Cook tomatoes 10 minutes, rub through a sieve, add soda, then add to the butter and flour cooked together, cook until thickened and season. This sauce is delicious for chops and cutlets and for use on baked macaroni. For the macaroni, butter a baking dish and put alternate layers of cooked macaroni and tomato sauce and finish the top with bread crumbs. Bake about 20 minutes.

THE RETREAT OF THE ANTS

Good Health.

[By H. E. Pastor, M. D.]

The Fly Pest Again.

As the spring season advances the invasion of the disease-carrying fly becomes more and more a problem to contend with. One of the peculiarities of flies which we have seen recently brought out, of some practical use, is that odors usually pleasing to human beings are offensive to flies, and vice versa. Among these are some of our most favored perfumes, as oil of lavender, heliotrope, mignonette, geranium, etc. They are said to especially dislike white clover, honeysuckle and hop blossoms. Try a little oil of lavender mixed with an equal quantity of water and sprayed around the room.

High Food Value of Eggs.

The food value of eggs is not as fully appreciated as it should be. They are very easily digested and their nutritive value is high. Uncooked eggs have a slightly greater food value than those that are cooked. In a mixed diet they furnish the body more nourishment than a corresponding amount of meat.

Report Communicable Diseases.

The State Board of Health has sent out the following appeal to both physicians and laymen relative to communicable diseases. The Board says, and very truly, that a single uncontrolled case of this kind might result in an outbreak that would greatly reduce the efficiency of California as a war unit. War or no war, however, information relative to contagious diseases should be reported to the proper authorities. Diseases so reportable under the California law include chickenpox, mumps, measles,

malaria, diphtheria, scarlet fever, typhoid fever, whooping-cough, smallpox, tuberculosis, pneumonia, anthrax, beri-beri, epidemic cerebrospinal meningitis, Asiatic cholera, dengue, dysentery, erysipelas, German measles, glanders, gonococcus infection, hookworm, leprosy, pellagra, plague, poliomyelitis, rabies, syphilis, tetanus, trachoma, typhus fever, ophthalmia neonatorum and yellow fever.

To Soothe Tired Feet.

Into about a gallon of water pour four tablespoonfuls of ammonia and two tablespoonfuls of bay rum. In this soak the feet for about ten minutes, when they should be withdrawn and rubbed briskly with a coarse towel.

Health Notes.

Where there is a one-sided discharge from the nose of a child, suspect the presence of a foreign body.
